Colloidal silver affects single-celled microorganisms *as long as it can physically touch them*. So, even though CS cannot disable pathogens in solids such as bone and feces, it *can* easily disarm them in liquids such as water, blood, urine, and lymph. If you take CS on an empty stomach, it will directly contact any *Helicobacter pylori* that's present (*H. pylori* is responsible for ulcers and stomach cancer). And CS traveling directly to a relatively empty gut, with no stool to block its passage, will kill unwanted microorganisms there that cause food poisoning and dysentery, such as *Giardia*. Similarly, in the laboratory, silver cannot affect pathogens in a solid, gel-like nutrient agar, but it *will* affect the ones living in a nutrient *broth*.

Just a few conditions that have been partially or completely eradicated by CS are gastrointestinal disorders (including diverticulitis and salmonella), hepatitis and other liver conditions, Lyme disease, malaria, pancreatitis, respiratory problems such as emphysema, *Herpes* virus ailments, the SARS virus, and Ebola.

Researchers at the University of Texas and Mexico University began using silver to kill *Staphylococcus aureus*. The *Journal of Nanotechnology* reported that silver particles killed 100% of the HIV-1 virus (incubated at 98.6°F or 37°C) within 3 hours—and that silver was expected to kill every other virus as well! The authors wrote, “The strong toxicity that silver exhibits in various

chemical forms to a wide range of microorganisms is very well known. . . . Silver nanoparticles interact with the HIV-1 virus via preferential binding to the gp120 glycoprotein knobs. Due to this interaction, silver nanoparticles inhibit the virus from binding to host cells.”²⁰⁷ (The scientists called the minuscule units of silver “nanoparticles”; but the silver particles ranged in size from one to ten nanometers, which are the sizes of silver *ions*, one of the two particle types in colloidal silver. Therefore, this “nanoparticle” label appears to have been incorrect.)

I’ll tell you shortly how you can make your own silver solution; but first, I want to discuss how silver can eradicate cancer, and its effects on immune response.

Enhancing Immunity

For a decade or so, the chemists, holistic health aficionados, and adventurous do-it-yourselfers in the global grassroots colloidal silver community enthusiastically focused on the pathogen-killing power of CS. Then they discovered that in addition to killing one-celled microorganisms, silver supports immune function.

Newer research, published in the European journal *ChemMedChem*,²⁰⁸ shows that silver modifies the effects of *cytokines*, small proteins that are involved in all types of immune and inflammatory responses. While small amounts of cytokines helpfully bring white blood cells to an injured area of the body, too many cytokines cause inflammation. Silver reduces the inflammatory response and increases the rate of healing. Inflammation both contributes to, and directly causes, many diseases and degenerative conditions; so using silver for healing shows great promise. If the immune response is more efficient, viruses can be eliminated even more quickly. (Note that although the article refers to silver “nanoparticles,” it states that their measurements are under 100 nanometers. Again, this is the size of *ionic* silver, so perhaps the researchers were lax in the term they used. Many people incorrectly refer to ions as “nano.” See Insert on page 405, “Saying No to Nano.”)

People who are seriously ill may be deficient in silver. This trace mineral is apparently an essential micro-nutrient.

Normalizing Cancerous Tissues

Silver’s immune supporting function is directly related to its ability to reverse the progression of cancer cells. This was discovered over 30 years ago by medical doctor Robert O. Becker. A highly credentialed clinician, professor and researcher, Becker taught at Upstate Medical Center in Syracuse, New York; was Director of

Orthopedic Surgery at Syracuse’s Veterans Administration Hospital; and wrote two books on electromedicine.

Dr. Becker began working with silver in 1971. He was trying to ascertain whether minute amounts of electrical current could cause rats to regenerate limbs, hoping that this would prove useful in healing broken bones in humans. Becker used silver for the electrodes instead of other metals because he believed that silver was not chemically reactive with the body’s tissues, and that it would also transmit current more efficiently.

After numerous tests, Becker concluded that the silver ions produced by the current, along with the current itself, were responsible for stimulating the normal growth of human tissue (including the regeneration of bone and skin). The silver ions reduced healing time by 50%. A paper published by Becker, Berger and colleagues in 1976, “Electrically Generated Silver Ions: Quantitative Effects on Bacterial and Mammalian Cells,”²⁰⁹ described how, compared to an inferior silver *compound* (silver sulfadiazine), silver *ions* inhibited the proliferation of bacteria between 10 to 100 times more effectively—and without any negative effects on normal mammalian cells.

Becker also discovered something else: When silver was injected, *it caused cancerous tissue to become normal again*.

As [ubiquitous] human fibroblast cells . . . were exposed to the electrically generated silver ions, they dedifferentiated. They were then able to multiply at a great rate, producing large numbers of primitive, embryonic cells in the wound even in patients over 50 years of age. These “uncommitted” cells were then able to differentiate into whatever cell types were needed to heal the wound. *So what we were in fact doing was turning on regeneration in human tissues.* . . .

This circuitous pathway led us back to one of our original aims, the control of cancer growth. If the electrically generated silver ion dedifferentiated normal human fibroblast cells, would it also dedifferentiate human cancer cells? . . . We did find that some human cancer cells in culture appeared to dedifferentiate when exposed to these silver ions. . . . It is important to realize that this is not simply an electrical effect, but the result of the *combined action of the electrical voltage and the electrically generated silver ions*. [emphasis added]²¹⁰

Most laypeople, and even doctors, have not heard of Dr. Becker. As his experiments became more promising and known, his research funding was abruptly withdrawn.

In addition to being ingested and applied externally in poultices, CS can be injected intra-muscularly or

intravenously. Health practitioners generally add a very pure silver solution to sterile physiological saline, or to Ringer's Solution (which contains 9,000 ppm of sodium chloride). Some researchers have reported that tumors and polyps shrink when CS is injected directly into them.

Contraindications

If made and used properly, colloidal silver has no negative effects on humans, animals, or plants. Very high amounts of CS use up the body's store of selenium, probably in similar ways to how large amounts of some nutrients can unbalance levels of other nutrients. Therefore, extra selenium should be taken. Selenium is most abundant in Brazil nuts and meats, although the amount of selenium in the soil determines how much of the mineral will be in plants and in the animals who eat the plants.

CS taken on an empty stomach will travel straight to the intestines. This is very helpful if you're suffering from food poisoning or dysentery. But what if you aren't? How might CS affect *beneficial* intestinal flora? Sources differ as to whether CS destroys beneficial flora. Most CS users don't experience digestive upset, but a few do. You can reestablish the intestinal flora population by ingesting yogurt or probiotic supplements several hours away from when you take the silver. If you drink CS when there's food in your stomach, the chances are slim that you will depopulate your intestinal flora. (Septic tanks, which house digestive waste, utilize friendly flora to break down the fecal material. So, if your home uses a septic system, don't pour CS down the sink or toilet.)

Common sense tells you to *avoid using CS if you're allergic to silver*. Silver allergies are rare, but for those who are allergic, reactions can be severe. As a precaution, put a few drops of CS on your tongue and wait for an hour. If there's no discernible reaction, take ½ teaspoon and hold it in your mouth for a few minutes before swallowing. If you're allergic, your response will be rapid and obvious. Some signs of allergy include a racing pulse, flushing, and burning, itching, red skin. Significantly, records of allergy to silver focus on sterling silver jewelry. It's not the silver to which people tend to react, but the nickel that's included in the mix of metals (sterling isn't pure), which makes the naturally soft silver harder and more durable.

An allergic response should not be confused with symptoms of die-off, also known as a *Herxheimer* reaction. Due to an overload of toxic waste from dead and dying pathogens, symptoms often worsen before people feel better. Large amounts of CS can kill pathogens so well that sometimes the body is overloaded. Toxic material is eliminated via the colon, kidneys, lungs, and skin.

Therefore, cleansing reactions can be as varied as diarrhea, excess production of mucus, sneezing, coughing, stuffiness, post-nasal drip, and itchy rashes. Keep in mind that if toxins are emerging through the skin, they are probably circulating in the blood too; and if toxins are that plentiful in the bloodstream, they might be excessively straining the liver and kidneys. Many people who are ill already have a weak liver and/or kidneys, so it seems wise to proceed slowly (good advice for any detoxification program).

A cleansing reaction may feel not only uncomfortable, but also scary, to those who aren't used to detoxing and don't understand how to interpret symptoms from the body's expulsion of toxic wastes. If you are feeling weak before you start, begin with a tiny amount—¼ teaspoon is plenty!—and slowly increase the amount according to your tolerance. If you have too strong a response, reduce or temporarily stop the CS until the healing crisis is over, and start taking it once more—again, in smaller amounts. Carefully monitor your responses. If you feel too ill, see a health practitioner. When I began taking CS, all I could manage was ½ teaspoon in 8 ounces of water, two or three times a day. Now I can drink an entire glass of pure CS at once, and feel only relief.

Making Colloidal Silver, and Particle Size

CS is a nearly tasteless, clear fluid. It's made by passing a mild electric current through two parallel wires of at least 99.9% pure silver, partially immersed in distilled water. This process yields a concentration of silver from 5 ppm to 15 ppm, a dilution that's effective for most purposes.

A number of companies sell reasonably priced, quality CS generators (see Appendix A). There are also plans on the Internet showing how to make your own generator for about ten dollars in parts. Fancier manufactured generators may have polarity switches, meters to measure the strength of the solution, and/or automatic stirrers.

To make safe, effective and stable colloidal silver, at least 99.9% pure (*not* sterling) silver must be used. Silver alloys such as sterling are legally allowed to contain large proportions of nickel and other metals, which can be toxic if ingested. Also, distilled water must be used. Spring, electrolyzed, or filtered water—even though suitable for drinking—contain dissolved minerals. Minerals are unwanted because they add excess electrical charge that speeds up the CS-making process too quickly and creates silver particles that are too large to be effective.

For the same reasons, never add salt or baking soda to the water when making CS! These items produce an inferior form of silver solution that may cause one's skin to turn gray (discussed in detail shortly). If you want to

Saying No to Nano

In the last decade, nanotechnology has been steadily impacting what we ingest and use daily. From personal care products and foods to paper, tennis rackets, epoxy resins and batteries, nano particles too small for the eye to see have migrated into thousands of products—and are entering our food supply at a rate of three to four per week. As with GMOs, cloned animals, pesticides and other items not adequately tested—or, if reported to be harmful, are approved for public use anyway—nano particles are not benign. In most cases, they are dangerous. Take titanium. Due to its superior ability to refract light, it gives the appearance of whitening or brightening. It's not only in paints, plastics and ceramic glazes, but also the coating on pills, skin creams, sunscreen, toothpaste, chewing gum, and even milk (presumably to improve its appearance and texture). An August 2013 study in *Biomedicine and Pharmacotherapy* concluded that titanium causes cancerous tumors.

Nano and *nanotechnology* are derived from the word “nanometer,” which is a billionth of a meter (about one 25-millionth of an inch). Larger than an atom or molecule, an ultra-fine nanoparticle is still much smaller than everyday objects. Nanoparticles range in size, but at least one part measures fewer than 100 nanometers.

The problem is that nanoparticles *almost* exist in the quantum realm. With particles this incredibly small, but not quite atomic, the usual rules of physics no longer apply. A substance's properties can change, often in unexpected ways. For instance, at the atomic level, all gold atoms behave the same way. And nuggets of gold large enough for us to hold exhibit the same chemical and electrical properties as each other. But at the nano level, two gold particles can exhibit markedly different color and behavior—different electrical conductivity, different melting temperatures, etc.—even if the particle sizes vary just a little. Nanoparticles have a greater surface area per weight than larger particles, so they are more reactive to other substances.

Some people are eager to alter the laws of physics and chemistry. For instance, one substance that has been nano-sized is aluminum. Ordinarily a soft metal, a nano aluminum alloy is stronger than steel. But while these quirky qualities might benefit industry, there are also serious dangers—precisely because the qualities of a substance can change so radically. The behavior of tiny, unpredictable nano particles cannot be controlled.

A quick glance at the MSDS (Material Safety Data Sheet) for just a few nanotechnology substances is very revealing. The MSDS is a legally mandated guide for industry employees who either manufacture or work with an ingredient. Nanoparticle MSDS documents report that routes of entry into the body are via inhalation, ingestion and skin absorption. Nanoparticles are so volatile, they

act like a gas instead of a solid, which is why they so easily penetrate skin, lung tissue and cell membranes! According to the MSDS for one company's nano gold, the toxicological effects have not been thoroughly investigated, exposure may be harmful, and a physician should be called. As is stated on an MSDS for nano iron, all employees handling this substance should work in a well ventilated room, and wear gloves, safety goggles and other protective clothing. With nano iron, the MSDS advises, exposure through ingestion may result in nausea and cramping; and after inhalation, skin contact or eye contact, a physician should be consulted.

Nanotubes (shaped like cylinders) behave similarly to asbestos fibers. Asbestos is a silicate mineral whose resistance to fire, heat, electricity and chemical damage made it ideal for use as electrical insulation starting in the late 1800s—until it was realized that prolonged inhalation of asbestos fibers causes serious lung damage, including lung cancer. Asbestos was finally restricted or banned altogether in the late 21st century. But now we use nano particles, which behave in some ways like asbestos but are freely used in industry anyway. These nanoparticles can be in the shape of claws, hooks, and wires as well as tubes.

Consider the incredible damage from minuscule claws, hooks and wires that slip through the skin and mucous membranes. Such tiny particles can disrupt cellular function without initially causing easily perceptible clinical damage. In fact, it might take years for a specific “disease” picture to develop. As if vaccines weren't already unsafe, nanoparticles are now being used to provide a delivery system for a virus. But the immune cells cannot recognize nano particles, and thus will be unable to eliminate what doesn't belong in the body.

Some manufacturers falsely (and foolishly) claim—perhaps to impress the public—that their items contain nanotechnology. What about claims of nanotechnology for silver products? Ironically (and to their detriment), some CS companies are calling their silver “nano” when the products, created by electrolysis, contain the normal, expected, safe mixture of atoms and ions. The CS particles that are *ions* (atoms with a charge) are less than 0.015 microns, an already tiny and absorbable size (1 nanometer = 0.001 microns). Literature for one nano silver product professes antibacterial, antiviral, antifungal and antibiotic properties when the silver is incorporated in coatings, bandages, dressings, plastics, textiles, fiber and soaps. These claims are correct; but homemade CS also performs these functions.

Some studies suggest that true nano silver—whose molecular shape by definition can be manipulated—might not be completely safe. Because nano silver is manipulated, it can be patented (and costs more). Homemade colloidal silver can't be patented. And it's very inexpensive to make.

make CS quickly, use some already-made CS as a “starter,” much as one adds a bit of already-made yogurt to milk to accelerate the fermentation process when making yogurt from scratch. Or, heat the water in a glass or ceramic pot. Heat makes the water more conductive, and will therefore speed the CS-making process.

Make sure to *clean the electrodes after every batch*, using a minimally-abrasive scrub pad. Electrodes build up a residue of silver particles. If the electrodes are coated, they won’t produce CS with an effective particle size.

A safe and effective silver preparation contains particles less than 0.015 microns in diameter, as well as silver atoms and ions whose diameters are as small as 0.230 nanometers. Both the colloid and (smaller, charged) ionic particles contribute to the solution’s effectiveness. They are readily absorbed and transported throughout the body, and are safely excreted by the eliminative organs.

The term *colloidal silver* is used by many researchers, vendors and users to refer to a number of different medicinal preparations that feature some form of silver, suspended or dissolved in a liquid (usually distilled water). One writer explains the various terms:

The word “colloidal” refers to a condition where, in this case . . . [groups of silver atoms bonded together, called *colloids*, are] *suspended* in a liquid . . . The solid particles are too large to be considered *dissolved*, but are too small to be filtered out. This colloidal condition is most easily detected by what is called the “Tyndall effect,” where . . . [an LED or laser] is shined through the liquid to produce a cone shaped dispersion of the light. The particles so illuminated also exhibit a random, zig-zag activity called “Brownian motion” when observed under a microscope. When something is completely dissolved, both the Brownian and Tyndall effects disappear.

The word “ionic” refers to a condition where a particle has an electric charge. In the case of “electro-colloidal” silver, this electric charge is *always* positive. . . . Electro-colloidal silver is [comprised of] *both* colloidal and ionic [particles]. . . . In fact, most of the biological studies suggest it is colloidal silver’s ionic characteristics that make it such a good germicide.²¹¹

We may only have scratched the surface of silver’s medical brilliance. Already it is an amazing tool! It stimulates bone-forming cells, cures the most stubborn infections of all kinds . . . and stimulates healing in skin and other soft tissues. I know of nothing which could quite take its place. Nor have I known anyone to abandon it who had thoroughly familiarized himself with the technique of its application.

—William Halstead, MD
a founder of modern surgery
(born 1948)

The global grassroots CS community (which has a large Internet presence) agrees that a more accurate name for “colloidal silver” is *electrolytically isolated silver* (EIS), because technically, what is being produced consists of about 80% to 90% ions. However, as “colloidal silver” is used generically by the majority of users all over the world, I will use the same term. Note that a silver fluid made by the EIS process is *very different* from mild silver protein, a product made by chemically combining silver with proteins or other additives. (I’ll discuss silver compounds in a moment.)

One chemist specializing in colloidal silver points out that both ionic and colloidal (larger-particle) silver kill pathogens, with some differences.

Ionic [silver] promotes healing and prevents scar tissue by allowing injured cells to revert to stem cells. Colloidal [silver] helps prevent argyria [a blue-gray discoloration of the skin] by providing seeds for the silver compounds that are eventually made in the body from ionic [silver], something to plate out on. Best is a combination of them both, with about 10% to 20% being colloidal.

Smaller particles affect viruses better than larger ones. Lower ppm EIS tends to have smaller particles. Higher ppm EIS can have a little hydrogen peroxide added to it to make the particles smaller, and thus be even more effective.²¹²

Argyria, CS Toxicity Propaganda, and the Problem with Silver Compounds

No toxic levels are known for properly made colloidal silver. The only known “side” effect of silver is *argyria*, a blue-gray discoloration of the skin or of the conjunctiva of the eye (where it’s called *argyrosis*). Although cosmetically upsetting, argyria doesn’t cause tissue damage or interfere with metabolic functions. Argyria typically occurs with silver *compounds*, not colloidal or ionic silver. And, although argyria can very occasionally occur with properly made EIS, quarts would have to be consumed daily for years.

Argyria typically occurs when large-particle silver, or its compounds, are ingested over such a long period of

time that the body's natural ability to excrete the silver through urine and feces is completely overwhelmed. Large silver particles, and/or silver salts, are deposited in the skin and other tissues, forming photosensitive compounds that darken upon exposure to bright sunlight. There are a few reports of argyria occurring in Caucasians, but no known cases among other races.

Argyria is very rare. Most recorded cases are the result of occupational exposure and the use of medically prescribed, high-concentration silver salts during the early to mid 20th century. Modern cases usually involve high concentrations of silver compounds. None of these cases involve properly made silver colloid that's used correctly.

I am aware of only three widely publicized reports of argyria. The first case involves a woman, born in 1942, who was prescribed nose drops at age 11 for allergies. By age 14, she had turned markedly gray. She cannot identify the exact medicine or the quantities used, but it's certain that she used a silver compound—not low-concentration, electrolytically produced CS. We know this because one, the colloidal silver making process had not yet been perfected when she was a little girl; and two, prescriptions using silver at that time could only have been compounds. Suffering lifelong ridicule due to her skin color, she has become a vocal opponent of all forms of silver.

In the second case, a 2002 Senate candidate from Montana, United States, developed a slight bluish discoloration that was visible on his fair skin under certain lighting. This discoloration came from his homemade brew that he erroneously called “colloidal silver.” It was not widely publicized that he made his concoction with tap water, electrically suffused his batches for one hour until they looked like coffee, and drank 8 ounces a day for two years. This brew was not CS!

The third incident concerned a fair-skinned man whose skin had turned markedly blue after many years of ingesting, and putting on his skin, a homemade silver solution he had created using salt. The salt made this substance a silver compound, not colloidal silver. In 2007, major US news networks interviewed the late Paul Karason about how he had adapted to life as a blue-skinned man who wasn't always accepted by others. What began as a human interest story on tolerance quickly turned into a review of the presumed dangers of colloidal silver, because that's what had supposedly caused Karason's skin discoloration. Despite overtures to Karason—by both CS manufacturers and individuals (such as myself) who wanted to help—he showed no interest in making CS correctly.

Despite the nontoxic nature of CS, the pharmaceutical industry, FDA, and their allies continue to mislead the public about CS. They warn that *all* homemade silver

solutions are toxic, citing studies that were conducted with silver *compounds*—and then deliberately fail to distinguish between the different forms of silver. A surprisingly large number of researchers erroneously refer to ionic and/or colloidal silver as “metallic,” which confuses the issue even more (and may deter the general public from making and using this inexpensive, effective ingredient). In the pseudo-scientific articles that warn against the one potential “side” effect of argyria—just one, I might add, compared to the nearly unlimited negative effects of toxic drugs!—the authors fail to disclose some vital facts:

- ◆ Most of the reported cases of argyria occurred in the 1920s and 1930s and involved manufactured pharmaceutical products.
- ◆ The technology used in early colloidal products was very crude, resulting in very large particles, high concentrations, and large doses of silver.
- ◆ Most early preparations were concentrated silver *compounds*, again resulting in very large doses of silver. Some of the more common silver compounds are silver nitrate, silver sulfide, silver chloride, silver sulfadiazine, and silver proteins (including MSP).
- ◆ Silver compounds have a potential to cause skin discoloration, but they may or may not cause it.
- ◆ In order for skin discoloration to take place, the product has to be used faithfully every day over a long period of time—two years or more—and the amount used must be substantial.
- ◆ The type of product used, how it's manufactured, and the quantities consumed are not mentioned. Also concealed are obvious flaws in the product's quality and intended use, as well as the differences between products that cause argyria and properly made CS.

Typically, the mainstream media prefers to present sensationalized stories about holistic technologies instead of seriously investigating them. I have never seen TV report the findings of Dr. Samuel Etris, a senior consultant at the Silver Institute, who states that there has never been any allergenic, toxic or carcinogenic reactions to CS. It's also doubtful that TV viewers are aware of the World Health Organization's upper limit recommendations for colloidal minerals, including silver: “It is unnecessary to recommend a health-based guideline value for [them] . . . because they are not hazardous to human health at concentrations normally found in drinking water.”²¹³

To be fair, the levels of colloidal silver that are drunk for therapeutic purposes are higher than those found in

drinking water rich in trace minerals. So, when discussing argyria, *how much* silver would be considered a toxic load?

Alexander G. Schauss, PhD—former professor at John Hopkins University, innovative researcher and expert on silver, and director of the *International Journal of Biosocial Research* at Life Sciences American Institute for Biosocial Research in Tacoma, Washington—explains in detail how and why the argyria scare became so widespread.

Most cases of argyria reported in the medical literature over the last 100 years involved chronic intravenous or intramuscular use of the silver preparations, most often involving a silver drug prescribed by physicians which in most cases contained silver nitrate. Other cases of argyria reported in the medical literature involve application of silver preparations used for many months or years in the treatment of the eye or vagina for certain diseases. We could not locate a single case of orally consumed colloidal silver manufactured in the last 25 years causing argyria in our review of the literature. This is probably due to the low levels of silver contained in such preparations, since only very small amounts of silver are needed for its antiseptic effect. Humans consume approximately 100 micrograms of silver every day in the diet. Additional amounts within this range would be considered safe by all reasonable estimates, especially if the amount needed to develop argyria would be equivalent of 380,000 micrograms (or 3.8 grams) of silver a day.²¹⁴

Again, low-concentration colloidal silver usually doesn't cause argyria (unless possibly gallons are drunk every day for years). However, argyria can occur if the CS is *improperly made*—such as when contaminated or mineralized water is used, or an ingredient such as salt is added to the fluid when the electrodes are running. Argyria is also more likely to develop if silver-and-salt solutions and silver proteins are used for long periods.

Occasionally, an article is published in a medical journal that accurately compares CS to silver proteins. In the *Annals of Occupational Hygiene*, the abstract of a 2005 article, “Exposure-Related Health Effects of Silver and Silver Compounds: A Review,” states that “exposure to soluble silver compounds may produce . . . liver and kidney damage, irritation of the eyes, skin, respiratory, and intestinal tract, and changes in blood cells . . . [while ionic] silver appears to pose minimal risk to health. The current occupational exposure limits do not reflect the apparent difference in toxicities between [these two types of silver].”²¹⁵ And in 2008, some dedicated researchers discovered the “Antibacterial Activity and Mechanism

of Action of the Silver Ion in *Staphylococcus aureus* and *Escherichia coli*.” They not only differentiated between the different forms of silver (“silver metal, silver acetate, silver nitrate, silver protein, and silver sulfadiazine”), but they stated that after a 90-minute treatment from “a silver ion solution that was electrically generated”—in other words, electrolytically isolated silver, or colloidal silver—“transmission electron microscopy showed considerable changes in the bacterial cell membranes upon silver ion treatment. . . . *the electrically generated silver ion appeared to be superior to the silver compounds in antimicrobial activity.*” [emphasis added]²¹⁶

Properly made colloidal silver does not contain flakes or turn dark. If it does, noticeable particles will settle in the solution over time. This fluid is not worth drinking. The particles are too large to be of therapeutic value, and your body will have to work harder to excrete them. You could try using the fluid for bathing, poultices or cleaning, but it won't work as well as smaller-particle silver solution because the therapeutic value of CS depends on its micron size. In fact, it very likely won't work at all.

Mainstream clinicians believe that argyria is irreversible. But holistic researchers have been able to eliminate the discoloration (or at least reduce it substantially) through detoxification and sauna therapies. In the unlikely event that your skin does become discolored, try the protocol in the Insert, “How to Reverse Argyria.”

Colloidal Silver Generators for Home Use

In the US, colloidal silver preparations between 5 ppm and 15 ppm can be bought at the health food store for about twenty dollars an ounce. This cost is excessive, considering that a seriously ill person needs to drink 1 cup or more of CS each day until the condition clears. Mild silver protein (MSP), colloidal silver protein (CSP), and products containing various silver salts are actively discouraged. They're unsafe (as they tend to promote, rather than deter, bacterial growth), and they're not as readily used by the body. Despite these drawbacks, many companies claim that their silver compounds are superior, luring uneducated customers to pay exorbitant prices for inferior products.

High-priced silver fluids are unnecessary! All you need to make your own CS is a generator, distilled water, plastic storage bottles, and an optional ppm meter so you can monitor the concentration of CS batches. (In a generator with a built-in monitor, an external one is unnecessary.) You can buy a CS generator with pure silver wire for under one hundred dollars. Instead of purchasing distilled water in soft plastic containers (whose molecules leach into the water), you can buy an inexpensive distiller.

How to Reverse Argyria

Introduction

Periodically, negative publicity emerges on the presumed dangers of colloidal silver—specifically, its ability to turn skin gray, a condition known as *argyria*. While argyria can and does occur, it is actually quite rare. The purveyors of this negative, emotionally-laden—and mostly inaccurate—hype focus on the shock value of argyria. They fail to mention that except for the cosmetic considerations, argyria is harmless. And they don't mention the causes of argyria—that skin can turn gray due to prolonged use of the *wrong types* of silver, and that it's rarely due to properly made electrolytically isolated silver (also known as *colloidal silver*.) By the time a silver color is visible in the skin, the buildup of silver in the body is quite extensive and has occurred over long periods of time, even several years. In order for argyria to occur, usually silver compounds—such as silver proteins and silver salts—must be used on a continual basis. Or, quarts of improperly made silver solution must be drunk every day. *The development of argyria depends on the type of silver that's ingested and how long it has been used.*

Colloidal silver, which is not bound to other elements, is normally excreted from the system very easily. But silver that's bound to other elements is much more difficult to excrete. Also, people with a slower metabolism are more susceptible to developing argyria because they don't eliminate silver as quickly as their faster-metabolism counterparts. If thyroid-lowering foods (such as soy, or raw goitrogenous vegetables), or any drugs (such as the antibiotic doxycycline) are taken, one's metabolism will be lowered—thus making one more susceptible to accumulating silver in the body. Liver impairment will also slow the metabolism of silver.

Typically, the people who needlessly instill the fear of argyria in others, conspicuously omit the fact that this discoloration can be reversed.

The Protocol

One very important piece of information on how to remove silver from the tissues and reverse argyria comes from, of all places, the United States Environmental Protection Agency. People with low levels of Vitamin E or selenium (a mineral)—both antioxidants—may have an increased risk of argyria because these nutrients support cellular energy production, which would help the body escort the unwanted ingredients out of the system. Keep in mind that silver is *not* a heavy or toxic metal. It's classified as a *transitional* or *noble* metal, which has very different properties from heavy—toxic—metals.

The following slow, but effective, protocol is adapted from Dr. Schauss, medical doctor Hans Gruenn, and activist Mark Metcalf, who has helped thousands of people become more educated and empowered by writing about the benefits of colloidal silver. To reverse argyria, take the following every morning with 1 quart (liter) of water.

- ◆ 200 mcg of yeast-free selenium (safe to take on an ongoing basis).
- ◆ Vitamin E, 100% mixed natural tocopherols (d-alpha, beta, delta and gamma tocopherols). High doses of Vitamin E thin the blood, so ask your doctor if it's safe for you to take it on an ongoing basis. People over 50 years old who may be at risk of stroke should take no more than 1000 IU. Those under 50 years old, and not at risk of stroke, can take 2000 IU per day. Vitamin E may be contraindicated in people on medication to thicken the blood, in people with hemophilia, and in others considered at risk for conditions that don't respond well to Vitamin E.
- ◆ 2 teaspoons organic MSM (methylsulfonylmethane). MSM, which is a sulfur compound, binds with silver and helps pull it from the body.
- ◆ 4,000 mg (4 grams) of vitamin C per day, in 1000-mg (1-gram) doses each. As long as you don't get diarrhea, you can take more Vitamin C until you reach bowel tolerance.
- ◆ 1 high-potency Vitamin B-complex tablet, 100 mg.
- ◆ 1 teaspoon kelp powder. (You might also be able to substitute ¼ to 1 teaspoon of liquid colloidal iodine.)
- ◆ Liquid or ionic minerals, including trace minerals, 2 ounces or more a day. A mineral formula containing fulvic acid works better than one without fulvic acid. (Fulvic acid is a combination of acids with high oxygen and high ionic mineral levels. Fulvics are used to nourish both the soil and humans, as they easily pass across cell membranes.)

In addition to the water taken with the supplements, drink another ¾ gallon (6 quarts or liters) of water a day.

—adapted from silvermedicine.org/forum/viewtopic.php?t=13 and silverprotects.com/argyria.html

After your initial investment, the price of a quart of CS is pennies instead of hundreds of dollars. Considering the effectiveness of CS as an antimicrobial agent, it's one of the most cost-effective protocols you can utilize.

There are different styles of colloidal silver generators on the market. All of them operate on the basic principle of sending electrical current through 99.9% pure silver electrodes to pull tiny silver particles and ions from the wires into the distilled water. The smaller CS generators, about the size of a boxy cell phone, have a simple on/off switch and usually, a light flashes on when the silver has reached a certain concentration. If the user wants a higher concentration, the unit is turned off to reset the unit, and a second round of electricity brings the concentration up. If a higher concentration is wanted, the unit is again turned off, and a third round of current is introduced. Generally, such units can make about a gallon at a time. Professional size CS generators are essential for clinics, where large numbers of clients make it necessary to produce a gallon or more of 12 to 15 ppm colloidal silver per day. The larger "industrial strength" generators are equipped with their own container, as well as a mechanism for stirring the batch of CS as it's brewing. For larger volumes, stirring is a good idea because it ensures smaller silver particles.

A good CS generator will produce silver particles of about 12 ppm. Although 5 ppm to 10 ppm (a popular concentration range) brings good results, experience suggests that the minimum concentration required for serious and chronic diseases is 12 ppm. Except for conditions such as cancer and Lyme disease, higher concentrations of 15 ppm or 20 ppm don't seem to be more effective than concentrations of 12 ppm.

Storing Colloidal Silver

It's useful to know how to store colloidal silver if you make it in large batches that you will not drink immediately.

- ◆ Some researchers advise storing CS in plastic instead of glass, because the silver may "plate out" onto glass—that is, break down into larger particles—thus lowering the concentration of silver in the liquid. (There are really no completely safe plastics, but the best one is PP. See Insert, page 261, "The Dilemma of Plastics and Bottled Water.") Some people, however, do store the silver safely in clear or colored glass.
- ◆ Colloidal silver is thought to store best at room temperature. Although extremes in temperatures don't seem to hurt it, if it's in plastic, excessively hot temperatures *will* cause harmful compounds in the plastic bottles to leach out into the silver solution.

- ◆ Properly made colloidal silver doesn't seem to deteriorate when exposed to light, so exposure to the sun will probably not hurt it.
- ◆ You'll know if your stored CS has become contaminated if it turns dark gray or purple (clear and light yellow are fine), or if visible silver particles start to appear in the water, often settling at the bottom. If this happens, the CS should be discarded. Visible silver particles or a darker colored solution indicate that fewer silver colloids or ions are suspended in the liquid—thus making the fluid much less effective for killing pathogens.

Incidentally, if CS is boiled, the increased agitation of the particles due to heat may cause them to clump together. And if frozen, the particles may crowd into the unfrozen part until they combine. Under these conditions, the silver might precipitate out of the solution and its benefits would lessen. But we don't have enough information to know the definitive effects of heating and freezing. Some people do cook with CS, and its benefits appear to remain intact.

Therapeutic Applications and Amounts

Internal Use

To reduce tooth decay and gum infections, colloidal silver can be swished in the mouth for a few minutes, and then expelled. For systemic infections, it can be swallowed. Holding it in the mouth, near the soft palate or under the tongue, will speed absorption directly into the bloodstream. CS also makes a terrific sinus wash or a nasal spray, with salt added just before using it.

Colloidal silver can be put into drinking water to purify it, or consumed without diluting it. As it has almost no taste, it can be substituted for cooking water without any loss of its therapeutic properties. Simply use CS instead of the water that ordinarily would go into soup, stew, batter, etc. One naturopath colleague attributes the robust health of his (unvaccinated) children to their effortless daily intake of silver from the moment they were born.

Some people worry that if CS converts to silver compounds in the body, it could lose its therapeutic benefits. For instance, the ionic portion of CS might interact with hydrochloric acid in the stomach, creating silver chloride. Or the same chemical combining might occur when salt is added to food cooked with CS. I haven't found an explanation of what precisely occurs once EIS enters the bloodstream, or how the different types of particles in CS interact with all of the bodily fluids. What we do know, is that CS works.

Uses for Colloidal / Ionic / Electrolytically Isolated Silver

Silver inhibits the growth of bacteria, viruses, and fungi, so it will keep items fresh and sanitized, and prevent spoilage and germ growth.

Food and Drink:

- ◆ Add to water when traveling or camping.
- ◆ Add to foods when canning, preserving, or bottling.
- ◆ Rinse fruit and vegetables before storing or using.
- ◆ Spray on top of opened jam, jelly, and condiment containers and inside lids before replacing.
- ◆ Put into cooking water or use entirely instead of water (as when making soup).

Household, including Kitchen:

- ◆ Spray on cutting boards, kitchen sponges, and pans that the dogs licked.
- ◆ Spray refrigerator, freezer, and food storage bin interiors.
- ◆ Add to swamp cooler water and humidifiers.
- ◆ Add to water-based paints, wallpaper paste, cleaning supplies, and mopping solutions.
- ◆ Treat shower stall, toilet seat, bathtub, tile floors, sinks, urinals, and shower mats.
- ◆ Pour into Jacuzzis, hot tubs, and swimming pools.
- ◆ Spray onto air conditioner filters after cleaning, as well as into air ducts and vents.
- ◆ Add to laundry final rinse water.
- ◆ Treat pools and fountains.
- ◆ Put into dishwashers.
- ◆ Wipe telephones, pipe stems, headphones, hearing aids, eyeglass frames, hairbrushes, combs, and doorknobs.

Personal Care:

- ◆ Spray on the skin for any type of wound: abrasions, acne, burns, cuts, rashes, and sunburn.
- ◆ Sterilize toothbrushes, surgical instruments, and shaver.
- ◆ Use as mouthwash, add to shampoo, and use as scalp rinse.
- ◆ Spray in shoes, between toes, and between legs.
- ◆ Soak dentures, and douche and enema attachments.
- ◆ Add to bathwater.
- ◆ Add to douches and colon irrigation water.
- ◆ Add to gargle and dental hygiene instrument solutions.
- ◆ Add to nasal spray.
- ◆ After bathing, spray on body.
- ◆ Spray or wash pillowcases, sheets, towels, and bedclothes of people who are ill.
- ◆ Add to bentonite clay to make a poultice for abscesses, boils, rashes, and wounds.

Pets and Plants:

- ◆ Pour into pets' water, or give to dogs and cats instead of water.
- ◆ Put in birdbath.
- ◆ Use as a quick, temporary dip for diseased fish (do *not* put it into their permanent aquarium water).
- ◆ Spray pet bedding and let dry.
- ◆ Add to shampoo for humans and animals.
- ◆ Spray plant foliage.
- ◆ Put into vases of cut flowers.

Electrical Appliances and Medical Supplies (silver-impregnated metal, plastic, and cloth):

- ◆ Linings of washing machines, laundry dryers, dishwashers, refrigerators, and toilet seats.
- ◆ Dental tools and appliances, catheters, and bandages.

—adapted from Robert C. Beck, "A Few Unique, Plus Traditional, Uses For Silver Colloid," 1998

Does heating CS cause it to precipitate out of solution? Perhaps a bit, but there's still enough small-particle silver present to help with healing. The heated, low-concentration silver solution may add back some of the trace amounts of silver that would have been in the food had it been grown on completely fertile soil.

Incidentally, sometimes when I take large amounts of CS to fight an infection, I add alkaline minerals to it just before drinking it—this way, the silver won't precipitate out of solution. Distilled water tends to be acidic, and makes the silver solution acidic. For many people, drinking acidic water is not beneficial. Willard's Water and other alkalizing preparations appear to alkalize the fluid without destabilizing the silver. (See the **Water** section at the beginning of this chapter for more information on distillation, pH, minerals, and Willard's Water.)

Inhalation Therapy

Colloidal silver has been successfully used in treating respiratory ailments when inhaled through a medical nebulizer. A nebulizer is compressor that delivers the CS in ultra-fine droplets of mist. It's either held in the hand or delivers the silver droplets through a tube that's attached to a face mask or breathing apparatus that the user wears. The nebulizer should produce droplets of 2 to 5 microns in size. The effectiveness of the silver is often improved with the addition of very small amounts of essential oils such as lemon, oregano, tea tree, eucalyptus and lavender, which have antimicrobial properties. Sometimes, people add a pinch of MSM (methylsulphonylmethane).

External Use

Colloidal silver is simple to use. To clean and sterilize wounds, simply saturate a bandage or clean cloth and apply it to the skin, making sure to keep it wet. Healing will be rapid, with no pain or scarring.

For virulent or life-threatening diseases such as malaria or HIV, the *concentration* (strength) of CS should not be less than 12 ppm. However, more than 12 ppm is not necessary. Remember, a homemade solution will not yield much more than 25 ppm or more. If you buy any silver product over 25 ppm, it's almost certainly a silver *compound*, and will not give you the benefits of CS.

It's difficult to "overdose" on colloidal silver. The amount you take should be determined by observed effect and the level of discomfort caused by the Herx symptoms. Two cups per day, divided into several servings throughout the day, is a reasonable amount. Those with cancer, Lyme, HIV, Ebola, or similar virulent infections will benefit by taking more, at least one gallon daily (again, divided into smaller amounts throughout the day).

Every Home Should Have It

To summarize, electrolytically isolated silver (EIS), or what's commonly called "colloidal" silver:

- ◆ Causes single-celled pathogens to die, almost instantly, by disabling the enzyme they need for respiration.
- ◆ Is effective for serious illness such as HIV, Lyme, cancer, and malaria at concentrations of 12 ppm.
- ◆ Affects single-celled microorganisms in a fluid medium (bloodstream, water, etc.), but not in solids.
- ◆ Appears to increase immune function in mammals, independent of its pathogen-disabling properties.
- ◆ Is an essential nutrient, as it promotes proper immune function, healthy cells, and tissue regeneration.
- ◆ Does not create permanent microbial resistance. (Some research indicates that soil-based microorganisms may develop a temporary resistance to concentrated silver, but this resistance leaves in one generation—which, in the case of soil-based organisms, is one to two weeks.)
- ◆ Can be ingested by itself, added to food and beverages, inhaled, bathed in, and applied topically to the skin.
- ◆ Is painless when ingested or applied.
- ◆ Tastes almost like pure water, so is very easy to ingest, even for small children, picky eaters, and animals.
- ◆ Is easy to make, requiring a simple device.
- ◆ Is completely safe and never poisonous in any amount.
- ◆ Is still effective at 25 ppm, although any higher ppm is probably a silver *compound*, which is not desirable.
- ◆ If improperly made, can cause a bluish gray discoloration of the skin, *which can be reversed*.

Today, more than ever, we need a reliable, safe substance that can kill many virulent pathogens—whether it's the simple flu, a stubborn *Candida albicans* infection, or more advanced diseases such as Lyme, patented strains of Ebola, Morgellons, or some other horror that hasn't yet been seen on all continents. You'll have an advantage if you own equipment for making colloidal silver and use it regularly. For a quick guide to how handy silver can be, see Insert on page 411, "Uses for Colloidal/Ionic/Electrolytically Isolated Silver."

One more thing. I believe in moderation. Unlike some people, I don't drink EIS every day, but save it for when I truly need it. However, when I do need it (as during an infection), I don't hesitate to drink a pint or more.

EXERCISE

Summary of Benefits

In the past, before high-rises, cars and elevators, our ancestors walked and trotted and ran. They chased the food they hunted and climbed to reach what they picked. Humans didn't sit for most of the day, hunched and slumped over their desks. They didn't ruin their eyes gazing at computers and playing video games. Nor did they need to walk on treadmills or climb the moving stairs at the local gym or health club in order to meet their quota of exercise. These are strange times indeed in which to be alive.

Although not everyone lives in a city today, often even country dwellers don't get enough exercise. Either diabetes or a pre-diabetic condition now affects over one-quarter of the population in the United States. Over two-thirds of adults are overweight or obese, and between one-third and one-half of the children are overweight or obese. Can you think of a better time to begin an exercise program?

Exercise promotes the following:

- ◆ Muscular strength (a muscle's capacity to push or pull against an opposing force).
- ◆ Muscular endurance (the ability of large muscle groups to exert force for extended periods of time).
- ◆ Cardiovascular endurance (the ability of the heart to pump blood through the circulatory system).
- ◆ Flexibility (range of movement around a joint).
- ◆ Improved body tissue composition (a lower ratio of fat compared to the amount of lean muscle and bone).
- ◆ Improved immune cell function (increased protection from infectious diseases).
- ◆ Increased breathing rate (which supports a greater oxygen-carrying capability in the lungs).
- ◆ Improved recovery times from injury (due to increased blood and lymph flow, which helps rebuild tissue).
- ◆ Increased sensitivity of the cells to glucose, insulin, and leptin (which help balance blood sugar levels and normalize weight, independent of calorie usage).
- ◆ Increased flow of blood, oxygen, and neurotransmitters in the brain (which encourages more stable moods and effective mental processing).
- ◆ Increased repair rate of *telomeres*—tiny caps on the ends of DNA strands—which help improve cellular health and have anti-aging effects.

Aerobic and Anaerobic Exercise

Exercise is generally classified into two types (although they do overlap to an extent): *aerobic*, which utilizes large amounts of oxygen, and *anaerobic*, which does not.

Aerobic exercise involves large-muscle groups. These are involved in steady physical activity such as running, jogging, brisk walking, swimming, bicycling, skating, dancing, skiing and other sports, which occur over a long enough period of time that more air than usual is taken into the lungs. During aerobic exercise, the heart functions more efficiently than when the person is resting, in order to provide the body with increased amounts of oxygen. The body is also more efficient at extracting and using the oxygen that it needs. Aerobic exercise increases levels of endorphins, cortisol and growth hormone, substances that increase pain tolerance and improve muscle tone. Aerobic exercise also induces sweating, which excretes toxins through the skin. (Sweating can be augmented with a visit to a hot tub, steam room or sauna; see the section on **Sauna Therapy** later in this chapter.)

Anaerobic exercise doesn't require as high an oxygen expenditure as aerobic. Stretching is generally anaerobic. Weight lifting used to be considered anaerobic, but it can *become* aerobic under these conditions: if it's done with lighter weights and many steady repetitions, and if it's done after high-intensity interval training or HIIT (discussed shortly).

Typically, moderate exercise is defined as causing a slight increase in breathing and heart rate. Brisk walking and bicycling, and tasks such as gardening and vacuuming, are usually included in this category. Vigorous exercise is defined as causing a substantial increase in breathing and heart rate. Aerobics (jumping) classes, running, and heavy manual labor are usually included in this category.

Exercise and the Lymphatic System

One important benefit of exercise is the easier movement of the toxin-laden *lymphocytes* (immune cells) of the *lymphatic system*. Most people are familiar with the cardiovascular or circulatory system, but less so with its lymph counterpart. The lymphatic system is a vast network of channels that run somewhat parallel to the blood vessels. They reach all the areas of the body, including the brain. I want to spend some time explaining how the lymph system works because these channels provide critical waste removal and immune support—and if they aren't maintained properly, the entire body can malfunction.

The nourishment and waste collection processes of the body are interrelated. Whereas oxygen exchange occurs in the red blood cells of the cardiovascular system, waste

Swim, But Not In Chlorine

Swimming is often (and correctly) touted as one of the best forms of exercise. Aerobic by definition, swimming utilizes the large muscle groups, which are responsible for the most rigorous movements (and a high calorie expenditure). But, unlike any other aerobic activity, swimming also works the muscles without stressing the skeletal system.

Water is twelve times as dense as air, providing 12% to 14% more resistance than when comparable exercise is done on land. By nature, water doesn't permit sudden movements, wrenching or jarring; so for the most part there are no impact injuries. Subjectively, the body submerged in water feels lighter. Immersed to the waist, people support half of their weight. Immersed to the chest, people support only about 25% to 35% of their weight. And immersed to the neck, people support only 10% of the body's weight.

Water disperses heat more efficiently than air, so compared to other forms of exercise there's less chance of overheating. However, the swimming water should be the correct temperature. For most purposes, the temperature should be between 85°F and 89°F (about 29.5° to 31.7°C). Those doing competitive swimming and high intensity water exercise can tolerate 82°F (about 27.8°C). The elderly, infirm, and children require warmer water.

Because swimming does not stress the joints, and both stretches and strengthens muscles, it's good for people who have arthritis. Movement while being immersed in warm water (exercise hydrotherapy) has been used for centuries for people with neurological and muscular disorders. Hydrotherapy often involves alternating immersion in warm and cold water. This moves the lymph.

In the US, most public swimming pools (as well as hot tubs) are sterilized with chlorine. In small amounts, chlorine causes skin rashes, boils, and allergies. In larger amounts, it's carcinogenic. Chlorine seeps directly into the bloodstream through the skin's pores, so swimming in a chlorinated pool is the equivalent of drinking gallons of chlorinated water. Therefore, even though swimming is wonderful exercise, it's a health hazard in contaminated water—whether the contamination is from pathogens or chemicals including chlorine.

If you can't get to a clean lake, river, or ocean, try to find a pool that uses ozone or salt water. There are also purification systems that utilize an electrolysis process to produce copper, zinc and silver ions, which kill bacteria and algae without the use of any chemicals. These systems are so effective and safe, it's amazing that they aren't more popular.

collection occurs in the lymph capillaries. Both systems deal with nutrient exchange because the cardiovascular system is so closely partnered with the lymph network.

During circulation, large arteries leave the heart on the left side, picking up (from both lungs) fresh oxygen carried by red blood cells. It is the oxygen that gives the arterial blood its bright red color. All other nutrients, along with the red blood cells, are carried by a clear, thick, viscous liquid called *blood plasma* or simply *plasma*. As the arteries become smaller, they branch out into smaller arterioles, and eventually tiny capillaries. Capillaries reach every cell in all the tissues to deliver oxygen to the body. When the capillaries arrive at the tissue sites, the red blood cells in the capillaries release the oxygen they were holding and pick up the carbon dioxide that's a normal byproduct of cell metabolism. At this point in the oxygen-carbon dioxide transfer, the arterial capillaries become venous capillaries. However, it's all the *same continuous network* of blood vessels.

Their job complete, the carbon dioxide-filled capillaries—which become somewhat larger venules, and then the large veins—return to the heart. It is carbon dioxide that gives the venous blood its dark red color. This concludes the discussion of how the blood travels, but there's one more pertinent detail. Capillaries are so tiny, they can hold red blood cells only if the cells pass through single file. Once blood reaches a capillary, there is so little room and such high pressure in the capillary channel, that some of the thin plasma fluid is squeezed from the capillary. This nutrient-rich, watery fluid bathes each cell, supplying the needed nutrients. The fluid squeezed from the blood plasma that surrounds each cell is now called *interstitial fluid*. After the cells extract their nutrition from the interstitial fluid, they dump, into this same fluid, the toxic waste products of their metabolism. This is the point at which the lymphatic system performs its valuable service of managing the waste materials from the body's tissues.

The lymph capillaries, designed to pick up vast quantities of debris, are highly permeable. The waste-filled interstitial fluid gravitates to the nearest tiny lymph capillary, where it is now called *lymphatic fluid*. (It should be noted that the lymph vessels are only near the venous capillaries and veins, not the arterial capillaries and arteries.) The lymphatic fluid then travels through the lymph capillaries to larger and larger lymph vessels, eventually arriving at cleaning stations called *lymph nodes*. These major lymph nodes are quite large. They are clustered in the back of the throat (where they are called *tonsils*), at the neck (where they are called *lymph glands* or simply *glands*), at the armpit, and in the groin area between the legs. In these lymph

nodes, the lymphatic fluid is cleaned and the toxins are neutralized by the white immune lymphocytes and other immune cells. Afterwards, the lymph fluid seeps back into the bloodstream. Any parasites, bacteria, fungi, viruses, and miscellaneous impurities remain in the blood, where the white immune blood cells called *leukocytes* gobble them up.

Unlike the blood, which is pushed through the body by the heart, the lymphatic fluid has no comparable pump. *A Massage Therapist's Guide to Pathology* states:

The immune system is unique. . . . It is a nebulous, incredibly complex collection of cells and chemicals stationed all over the body whose coordinated function is . . . fundamental to keep[ing] the whole organism alive.

If everything is working well, fluid levels in the tissues should be constant, but not stagnant. The amount of fluid being squeezed *out* of circulatory capillaries should be almost equal to the amount being drawn *into* lymphatic capillaries. .

. . . But a backup anywhere in the system could result in major changes in fluid balance. If lymph vessels or nodes are blocked, for instance, the body won't stop producing interstitial fluid. This fluid will accumulate between tissue cells. It will cause swelling and quickly become a hindrance to diffusion and other chemical reactions. . . . This is the problem with many of the diseases of the lymph system. . . .²¹⁷

Lymph fluid is extremely dense. It moves when it's subjected to mechanical pressure, to alternating heat and cold (which expands and contracts the tissues), and to deep breathing (which moves lymph fluid in the diaphragm area). The mechanical pressure moving the lymph can be either externally applied, as with massage, or generated from within, as when exercising. "When muscle fibers squeeze down around lymphatic vessels," write the authors of *A Massage Therapist's Guide to Pathology*, "they push [lymphatic] fluid through just like a hand squeezes around a tube of toothpaste."²¹⁸

When we don't move, we contribute to our own autointoxication and eventual illness. Once the lymph vessels become too clogged, a strong odor from the body (especially the feet and armpits) emerges—often accompanied by low energy, swollen glands, foggy thinking, and even depression. There are many ways to induce movement in the lymph vessels; continue reading.

Anti-Inflammatory Effects of Exercise

Exercise fulfills another, vital function. Naturopath Jade Teta writes:

Properly performed exercise releases signaling molecules that stimulate a unique healing response that couples both inflammatory and anti-inflammatory mechanisms to repair, regenerate, and grow stronger tissue. . . . High-intensity, short-duration movement that is tailored to the individual, uses short rest periods, and engages the whole body may be the chief means of attaining anti-inflammatory effects from exercise.

As muscle [voluntarily] contracts, the genes controlling IL-6 [Interleukin-6, a type of *myokine* or protein secreted by muscles] are turned on. . . . When released from muscle [IL-6 is produced elsewhere in the body as well as in the muscles], and in high concentrations without [certain other biochemicals], IL-6 is anti-inflammatory.²¹⁹

Whenever I feel
the need to exercise,
I lie down
until it goes away.

—Robert Maynard Hutchins,
educational philosopher,
dean of Yale Law School
and president of the
University of Chicago
(1899–1977)

Fibromyalgia is a condition characterized by chronic muscular inflammation and pain. The pain and fatigue from fibromyalgia may discourage people from exercising, but those suffering from this condition often are the ones who need it the most. They will greatly benefit from *moderate* exercise. The fact that exercise helps curb inflammation, and also helps protect the body from diabetes, cardiovascular diseases, dementia, depression and cancer, points to the role of inflammation in these conditions. I will soon discuss, in more detail, the high-intensity exercise that Jade Teta recommends.

Exercise, Telomeres, and Anti-Aging

People who exercise on a regular basis report feeling not only better, but younger. This isn't subjective—they are experiencing what's actually occurring in the body. More cells are being restored, and more quickly. This restoration is measurable in the rapid transformation in the *telomeres*, proteins at the ends of chromosomes that are analogous to the plastic tips at the ends of shoelaces. The function of the presumably inert telomeres is to protect chromosomes from binding to each other (DNA is very sticky). Normally, every time a cell divides to create another cell, a bit of telomere tip is removed and the total amount of telomere material lessens. After the protective telomere tip wears away—leaving a DNA

Exercise helps people with inflammatory illnesses, heart disease, and even cancer. A team of researchers studied about 200 women with breast cancer who enrolled in a supervised 12-week exercise program in Scotland. Exercise included fast walking. Greater shoulder mobility and an improved psychological profile, reported by the women, extended for six months after the end of the exercise regimen.

Researchers who reviewed 48 earlier studies found that postmenopausal women who exercised reduced their risk of breast cancer by up to 80%. Exercise had a 20% protective effect for pre-menopausal women.

—reported in *Epidemiology* (2007)
and *British Medical Journal* (2007)

“frayed shoelace”—the cell can no longer replenish itself. In people who exercise regularly, the white blood cell telomeres are longer than in those who don’t exercise. Conversely, the telomere tips of people who feel stressed are almost 50% shorter than in their less stressed counterparts. The biological age of stressed subjects averages nine to seventeen years older than in their calmer counterparts of the same chronological age. Research studies—with intriguing titles such as “Exercise Controls Gene Expression”²²⁰ and “The association between physical activity in leisure time and leukocyte telomere length”²²¹—show positive genetic changes in people who exercise regularly compared to those who don’t.

The longer the telomeres, the more time it will take for them to deteriorate. This means that the body’s cells live longer. Thus, the erosion of telomere material indicates aging. Exercise prolongs the survival of the telomeres—hence the cells, and hence the lifespan of the person.

Children who grow up in extremely stressful environments—such as severe, repeated levels of physical, sexual, and/or emotional abuse—develop changes in their DNA that are associated with (among other conditions) diabetes, heart disease, and mental illness. This in itself is not surprising. However, the scientists who understand that telomeres shorten due to stress, and who (correctly) link this shortening to illness, mistakenly insist that the telomere damage is permanent. They seem unable to understand that if a negative environment can cause undesirable biological and physiological changes, then the introduction of a positive environment—which includes love, good nutrition and exercise—can likewise halt, and perhaps even reverse those negative changes. People who exercise don’t need scientists to tell them what they already know: that exercise helps them feel better. However, it’s important to do the right kind of exercise, and everyone is different.

When and How Much

Ideas about when we should exercise, and how much, have varied throughout history. The ancient Greeks had a high regard for health and fitness, evidenced by their Olympic games and efficient Spartan army. The Chinese encouraged exercise (which included an elaborate system of martial arts) to avoid health problems like diabetes and heart disease. Pregnant tribal women in Africa have often conducted their usual high levels of activity until just before giving birth, resuming their daily tasks afterward with hardly any interruptions. A century ago in Europe and the United States, a pregnant woman was considered frail and weak, and was advised not to exercise. Today, her normal, healthy counterpart is counseled to keep moving!

Similar changes in ideas have occurred with the types of exercise deemed the most valuable. For instance, exercise physiologists agree that any movement of large-muscle groups increases heart and breathing rates, improves oxygen utilization, and helps the cells excrete waste material. Everyone agrees that brisk activity is beneficial for reducing the incidence of cardiovascular diseases.

For how long? Here’s where it gets interesting. There are two schools of thought: the prevailing popular one, and a more recent, minority approach that almost seems counterintuitive to what we think we “know.” I’ll discuss both, and you can decide which one feels right for you.

Popular Exercise Styles

The Drill Sergeant Method

A widespread, popular belief about exercise is that it must be frenzied in order to be beneficial. Many gyms and athletic trainers promote at least 30 minutes to one hour of demanding activity, five days a week, as the barest minimum of activity required to stay in shape.

No matter what health club I’ve visited across the United States, the members always seem determined to push themselves beyond what their bodies can conceivably tolerate. This “no pain, no gain” mentality is adopted by many bodybuilders, weight lifters, and high-impact aerobic fans. Unfortunately, the majority of trainers act like military drill sergeants and seem to know nothing about how the body works. People huff and puff, strain and struggle contorting their faces. By emphasizing quantity of weight and the number of repetitions, they become tense all over (an inefficient use of energy), never properly building the muscles they say they’re trying to strengthen.

Many people don’t know that part of the massive bulk in a very beefy weight lifter is scar tissue. Normal exercise induces the body to create more muscle fibers. But too much strain, pressure and weight on a muscle causes the

fibers to tear; and when they heal, irregular scar tissue forms. Unlike normal tissue, scar tissue has no blood supply and almost no strength, flexibility, or elasticity (muscle tone). The main purpose of scar tissue is to cover and protect the injured areas. If the scar tissue is not broken up and reabsorbed into the body (such as through massage or ultrasound), it prevents the surrounding healthy tissue from receiving an adequate supply of blood and oxygen. Eventually, movement is inhibited throughout the body and one's posture suffers. The presence of scar tissue can disrupt the healing of any nearby tissue. And acupuncturists are well aware that scar tissue prevents energy from flowing in the meridians.

I believe that movement and strength training should be pleasurable challenging rather than negatively stressful. If you're straining to the point where you really hurt, and the pain does not lessen within a few days, this is a signal that you're hurting yourself.

HIIT: Gentler But More Effective

Exercise physiologists suggest that even gentle walking for 20 or 30 minutes per day can do wonders for both the cardiovascular and the lymphatic systems—providing, of course, that the right foods are eaten. (See Sidebar, “Eating Correctly for Exercise.”)

Even briefer periods of brisk walking can significantly help improve health, as shown by a recent study conducted by researchers at the University of Ulster in Northern Ireland. Twenty-one inactive men and women in their mid-40s briskly walked for either 10 minutes three times a day, or for 30 minutes once a day, five days a week for six weeks. After a two-week rest period, each group switched to the other group's walking routine for another six weeks. Both groups boosted their levels of beneficial cholesterol, and improved their aerobic ability and psychological well-being.

This new understanding that the body doesn't have to be tortured to benefit from milder physical activity has led to the development of *high-intensity interval training* (HIIT, sometimes given the acronym HIT), sometimes called *high-intensity intermittent exercise* (HIIE) or *sprint interval training* (SIT). Various versions have been developed, based on principles reported by German coach and university professor Woldemar Gerschler and Swedish physiologist Per-Olof Astrand—but the main idea is this: The body burns more calories, achieves better shape and tone, loses more fat, and undergoes less debilitating stress (and more of the good kind of stress that's challenging), when there are relatively short bursts of intense exercise followed by periods of rest. This is instead of conventional aerobic workouts that last for much longer periods.

Conventional aerobic workouts, which push the cardiovascular system—typically achieved by running, jogging, bicycling or using an elliptical machine—have actually been found to deplete the system of necessary nutrients, stifle the production of beneficial hormones, and stress the heart too much. In contrast, HIIT helps the body conserve its strength. It engages more of the muscle tissues that you want to engage—the fast and very fast muscle fibers, not just the slow muscle fibers (which are the ones people use during long-distance running). This results in more blood flow, allowing more oxygen to circulate throughout the body. It activates more mitochondria, the fuel burning units of all the cells, yielding more energy. And it produces the valuable human growth hormone (HGH), which vastly shortens recovery time, helps increase bone density, balances mood, strengthens the heart, favorably regulates the muscle-to-fat ratio in the body, and assists with sugar and fat metabolism. (Some athletes take synthetic HGH, but why risk unwanted effects from an artificial, not quite biologically compatible preparation—when you can get your own pituitary gland to produce it naturally?) Finally, unlike when doing conventional aerobics, during HIIT, the skeletal muscles produce *myokines*. This word is a combination of *myo*, the Latin root for “muscles,” and part of the word *cytokines*, which are inflammatory compounds. However, myokines—which are produced by the muscles—respond in opposition to the inflammatory cytokines. Not only do myokines eliminate the pain caused by inflammation, but they also increase sensitivity to insulin, thereby increasing the utilization of glucose inside the muscles.

Thus, the mentality of “more is better” and “pushing brings more results,” is proving to be completely untrue. As difficult as it might be to believe, compared to conventional aerobic exercise, HIIT requires only minutes a week. People are getting the results they want by doing

Eating Correctly for Exercise

When your body is accessing fat for fuel, any motion (except short bursts of speed, such as sprinting) will increase the fat burning process. . . . [You can analogize] fat [as] being a log, and carbohydrate is the kindling. Trickle in small amounts of carbohydrate (kindling to start the fat burning process), and the fat (log) will burn long and steady. Dump in too much carbohydrate and you get a flash fire that flares quickly and then burns out.

—Jay Robb
The Fat Burning Diet, 1996

Mindful Exercise

Simply by telling 44 hotel maids that what they did each day involved some serious exercise, the Harvard psychologist Ellen Langer and Alia J. Crum, a student, were apparently able to lower the women's blood pressure, shave pounds off their bodies and improve their body fat and "waist to hip" ratios. Self-awareness, it seems, was the women's elliptical trainer.

At the start of the study, Langer and Crum quizzed 84 maids at seven carefully matched hotels about how much exercise they got. Fully a third of the women said they got no exercise at all, while two-thirds said they did not work out regularly. Langer and Crum took several measures of the women's basic fitness levels, which indicated that they, indeed, had the poor health of basically sedentary people. Then just over half the women were told an unfamiliar truth: cleaning 15 rooms daily—pushing recalcitrant vacuum cleaners, scrubbing tubs, pulling sheets—constitutes more than enough activity to meet the surgeon general's recommendation of a half-hour of physical activity daily. The researchers even provided specifics: 15 minutes of scrubbing burns 60 calories, 15 minutes of vacuuming burns 50. The basic message and the details were then posted in the maids' lounges in the hotels where the 44 women worked, to serve as reminders, while a control group was left in the dark.

A month later, Langer and Crum checked back with the women to find . . . remarkable results. The average study-group maid had lost 2 pounds, while her systolic blood pressure had dropped by 10 points; by all measures the 44 women "were significantly healthier." Yet there were no reported changes in behavior, only in mindset, with the vast majority of the women now considering themselves regular exercisers. Langer sees the study as a lesson in the importance of mindfulness. . . .

New York Times Magazine, December 9, 2007

HIIT for 12 or 15 minutes per week compared to several hours a week. How, exactly, is this being accomplished?

Dr. Joseph Mercola, whose holistic health website ranks first in the world as the most viewed, suggests the following schedule. Exercise *at maximum speed, resistance and difficulty* for 30 seconds, followed by a 90-second recovery time. Repeat for a total of up to eight cycles or repetitions. You are working your body very, very hard—pushing it to its maximum limits—so you must give yourself the full 90-second recovery period between the 30-second bursts of activity. Initially, beginners may be able to complete only a few cycles, but that's okay.

Here's some more good news: HIIT does not need to be done every day, but every other day—about three times a week! The high-intensity exercise can be done with barbells, on a treadmill, stairmaster (a stationary staircase that keeps moving, like an escalator), or other piece of equipment that demands maximum output from the large muscle groups of the body. I began my own HIIT regimen using a stairmaster. At first I could do only three sets, but in an amazingly brief period of time, I worked my way up to six (and sometimes eight) sets, depending on how much energy I had on a given day. My rewards were almost immediate: a decrease of body pain, increase in energy, and improved mood. After that, I explained the protocol to an ex-military officer. He had been accustomed to doing lots of physical exercise, including riding his bicycle for ten miles a day. Yet after only four cycles of HIIT, he was winded! He simply could not believe that he would find

any form of exercise strenuous. His results, along with my own, convinced me that this new form of exercise—HIIT—was indeed beneficial and unique.

Results from HIIT, which are reported to be typical of everyone who faithfully practices it, include:

- ◆ Improved muscle tone
- ◆ Firmer skin
- ◆ Higher and steady energy levels
- ◆ Elevated and more stable moods

To complement HIIT, Mercola advises strength training (using barbells, stretch bands and/or some other type of weight), stretching (holding each stretch for only two seconds, to allow the body to repair itself), and exercises to strengthen the core of the body. "Core" muscles are located mostly in the back, abdomen and pelvis. Good core exercises include balancing, and movements that work the abdominal muscles only.

The theory behind HIIT makes sense. Historically, humans evolved doing high-intensity exercises. They would move intensely for brief periods of time, and then rest (as when hunting).

The moral of HIIT and similar programs is pretty clear: *Exercising for too long can backfire!* Intense aerobic exercise without sufficient rest periods can lead to heart damage, high levels of oxidative stress (the production of free radicals in the body), and inflammation. If, after exercising, you suffer from exhaustion instead of feeling

energized, or if you experience unstable or negative moods, unusual illness, or sleep disruption (not to mention feeling abnormally sore)—*you’re doing it wrong*.

In case you’re not convinced to at least try HIIT, consider the following data. For a long time, scientists said that an excess of lactic acid in the blood was the biochemical counterpart to over-exercising, or not adequately resting between normal periods of activity. This was thought to be the cause of dizziness, fainting, and what is sometimes called “exercise-induced asthma.” Now, at least some physiologists believe that exercise fatigue is the result of impaired calcium flow in the muscles. *The New York Times* reports:

Ordinarily, ebbs and flows of calcium in cells control muscle contractions. But when muscles grow tired, . . . tiny channels in them start leaking calcium, and that weakens contractions. At the same time, the leaked calcium stimulates an enzyme that eats into muscle fibers, contributing to the muscle exhaustion.²²²

Clearly, one should stop exercising before reaching this state of extreme depletion. Supplementation of extra magnesium, along with Vitamin K2 and boron, will help with calcium balance and absorption.

Music During Exercise

It’s well known that listening to music during exercise improves results. Music helps people work out more vigorously, and for longer periods (partly because the music distracts them from feeling fatigue). In addition, tempo (a song’s speed) plays a role. Dr. Costas Karageorghis, associate professor of sport psychology at Brunel University in England, has determined that for rigorous exercise, the best tempo is from 120–140 beats per minute (BPM). This is the pace of many rock songs and commercial dance pieces. This pace is also close

to the average person’s heart rate during an elliptical training workout. For a stroll of about 3 miles an hour, 115–118 BPM is best; for a power walk of about 4.5 miles per hour, 137–139 BPM is best; and for a run, 147–160 BPM is best. Interestingly, even just *thinking* about music can help with an exercise regimen.

Best Times to Exercise

The timing of a rigorous workout can be as important as the intensity. Evenings, and just before bedtime, are not good times to charge the system. One holistic practitioner writes:

My experience with training athletes, as well as with my own training, has been that people naturally train better when their cortisol levels are high. Since cortisol levels rise with the sun, reaching peak blood levels around 9 a.m. to 11 a.m. and then progressively set with the sun, most of you will find that you get your best performances in this time frame.²²³

Cortisol, you will recall, is a stimulating hormone secreted by the adrenal glands. It’s unwise to raise cortisol levels—and hence metabolism and body temperature—when the system should be preparing for sleep. Sleep requires lower, not higher, levels of cortisol.

Another aspect of timing, which one might not consider, is the need to move if you tend to be stationary. These days, many people have jobs requiring them to sit for hours at a time—often typing at computers, their necks held stiffly. Sitting for prolonged periods without movement causes severe back pain. With reduced blood and oxygen flow caused by improperly held muscles, disc degeneration can occur. If you sit a lot, be conscious to maintain proper posture. And get up and move at least every 45 minutes or hour. It will do wonders for your hormone levels, muscles, energy, and DNA.

Exercise Benefits and Bones

Grandma used to say, “Exercise builds strong bones. Get whatever-it-is out of your system. Go out and play. You’ll feel better.” Finally, science has proven the validity of this piece of folk wisdom, which we have always felt . . . in our bones.

Exercise does build stronger bones by increasing bone density. But as it turns out, our skeleton—which consists of many types of cells fed by blood vessels—does more than simply hold us up. This living, ever-changing tissue we call “bone” produces hormones! In the past two decades, research by geneticist and endocrinologist Gerard Karsenty has shown that *osteocalcin*, a protein-based hormone found in high concentrations in the skeleton, is sent by bone to regulate crucial processes throughout the body—including male fertility (it increases testosterone production) and improved blood sugar regulation (it increases insulin sensitivity and amounts). Osteocalcin has also been found to favorably influence sleep, prenatal brain development, cognitive functions (including learning and memory), and emotional responses (such as depression and anxiety). These findings explain why brain function and mood improve with weight training and other load-bearing exercise, including even walking.

If You're Just Starting

You don't have to incorporate the "no pain, no gain" mentality into your workouts, as stated in the section on HIIT. There's a difference between the discomfort that results from giving your muscles a nudge (the good kind of challenge), and the kind of pushing that causes the muscles to become injured (no longer a challenge, but stressful). If you have a medical condition that makes strenuous activity difficult, or if you're just starting to exercise, *begin slowly*. You don't have to run a marathon or thrash your limbs to benefit aerobically. A brisk walk is fine. Dancing is even better: it stimulates learning, balance, and memory. Yoga, gentle movements in water, and (for some) stationary bicycling, are good low-impact exercise. A rebounder (miniature trampoline) with a support bar moves lymph without stressing the body. Unlike a trampoline, a rebounder does not require one to lift the feet off the surface in order to bounce. Merely bending the knees slightly, and then straightening them, facilitates movement. People unable to stand and bounce themselves can benefit by sitting on the rebounder while someone else bounces. Or, they can sit on the rebounder while someone else presses up and down on their shoulders to promote movement. Rebounder exercise three or four times a day for even just a few minutes can be very helpful.

Whatever you do, be easy on your joints. When stretching, don't push your muscles farther than they can comfortably go. Lean into the stretch, and let your body's own weight (and gravity) do the work. Injury to a muscle, tendon or ligament may indicate microtears. If you injure a muscle or other tissues, using any of the Avazzia® instruments, the Magnetex®, or an electrode rife machine can help with repair. See Appendix C for more information on this equipment.

Unused muscles become stiff. Eventually, they atrophy. Sitting for long periods without getting up to move can cause severe back pain (and reinforce poor posture). If you sit for long periods, get up every 45 minutes and move.

Incidentally, researchers have discovered that polyester and other synthetic materials hold much more bacteria than natural fibers. You might be tempted to wear the latest workout fashion of tight polyester (which is made from coal and petroleum), but consider a cotton outfit, which allows your skin to breathe when you sweat.

After exercise is a good time for a massage or a chiropractic adjustment. See **Bodywork**, next.

BODYWORK

The Physiological and Emotional Components of Touch

The respected sociologist Ashley Montagu (1905–1999) was a perceptive soul who published many books about the biological influences on human relating. He wrote that having been raised in stiff, upper-class England, the British fear of physical intimacy frustrated and saddened him. As one might expect, the taboo against touching that's rampant in Western countries is a recurring theme in his books.

Montagu cited some interesting studies conducted in restaurants and other public places, where lovers, families and friends were watched to see how many times an hour they touched each other. Latinos were found to be the most tactile (and correspondingly, the most emotionally expressive). Scandinavians were deemed moderately tactile, and people who speak Anglo-Saxon-derived languages touched the least. In Spain, people touched over one hundred times an hour, in America about four, and in Britain, a pitiful zero.

Touch deprivation takes on special meaning when we consider the origin of the skin. In the developing embryo, some of the outer membranous covering folds back into the body to become the brain, spinal cord, and central nervous system. The rest of the outer covering becomes the hair, nails, teeth, and skin. In his wonderful book *Touching: The Human Significance of the Skin*, Montagu wrote that the nervous system is:

a buried part of the skin, or alternatively the skin may be regarded as an exposed portion of the nervous system. It would, therefore, improve our understanding . . . if we were to think and speak of the skin as the external nervous system, an organ . . . which from its earliest differentiation remains in intimate association with the internal or central nervous system.²²⁴

Thus, the exquisitely sensitive organ we call "skin" is essentially one giant covering of nerve tissue that happens to be on the outside of the body instead of the inside. This remarkable connection between the skin and the human nervous system reflects just how sensitive we really are to external stimuli, including touch. In fact, a loving touch promotes the body's production of the hormone *oxytocin*, which has also been called the "attachment" or "trust" hormone. Oxytocin beneficially affects relationships of

The Church says: *The body is a sin.*
Science says: *The body is a machine.*
Advertising says: *The body is a business.*
The Body says: *I am a fiesta.*

—Eduardo Hughes Galeano
Uruguayan writer, journalist and novelist
(1940–2015)

all kinds: parental love, friendship, sexual attachment. It reduces stress and pain, improves immune function, helps with sleep, and induces the desire to protect.

It's no accident that we use the word *touched* to indicate being affected on a deep emotional level. For human beings, as with all mammals, touching is inseparable from love (especially in infancy) because our first experience of communion in life is through bodily contact. Despite the highly sophisticated, symbolic language that we develop later, we never outgrow our need for touch. This is illustrated by a study done by psychologist Rene Spitz in the 1940's, on human babies isolated from their mothers. The mothers, too poor to care for their infants, had placed them permanently in a foundling home. The children were kept in what Spitz called "solitary confinement": cribs with sheets hung from the sides, so that the only thing the babies could see was the ceiling. Nurses seldom visited them more than a few times a day. And even when feeding time came, the babies were left alone with just the companionship of a bottle. Hygiene in the nurseries was impeccable. But without being held and loved—given the sense that they belonged—the babies suffered lowered immunity. Thirty-four out of 91 died. In some of the other foundling homes, the death rate climbed to 90%.

One of the most famous studies on touch is the animal-behavior experiment with monkeys conducted by psychological theorist Harry Harlow in the 1950s. Harlow separated infant monkeys from their mothers during the first critical months of their development, and put them in a room with two monkey "mothers" made of wire. One wire figure had a bottle attached to it for feeding. The other wire structure contained no bottle, but was covered with soft cloth to simulate the mother's fur. Much to the surprise of Harlow and his associates, the young monkeys stayed with the food-and-wire figure only long enough to obtain the nutrients they needed. They spent the rest of the time clinging to the cloth "mother." The cloth figure was the primary means of communication and comfort for those baby monkeys. That this experiment is instantly recognized as cruel demonstrates our instinctive understanding that pleasurable bodily contact is a basic need. Later experiments with primates showed that infants who were neglected or mistreated by their parents were impaired in their ability to relate to other primates, and as adults were unable to care properly for their own babies. The adult primates did not know how to mate, and were even overtly hostile to their newborns.

**There is more wisdom in
your body than in your
deepest philosophy.**

—Friedrich Nietzsche
German philosopher, poet,
cultural critic and composer
(1844–1900)

In this respect, the needs of human beings are similar to those of monkeys and other mammals. Feeling close to others gives us a sense of well-being, pleasure, and a greater ability to develop close emotional relationships with others later in life. Something is missing when our need for intimacy with others is thwarted. Our physical needs for food and shelter might be met—but, like Harlow's monkeys, if we are not held, caressed and played with, we grow up starved for love (assuming we don't die first from its absence).

In the US and other highly industrialized parts of the world, the emphasis of the supposed superiority of the mind and the "baseness" of the emotions relegates the body to little more than a mobile unit to transport the esteemed head. People are taught that their own bodies are not

the major, or even a valid, barometer of their experiences. Children are encouraged and compelled to mistrust their perceptions, emotions, and even their sensations. The educational system and media push children to become consumers of other people's "facts," fantasies and beliefs instead of experiencing their own truths. The ways in which people minimize and

numb themselves to their true feelings, and how to access those feelings, would require another book. However, what I can address here is how emotional repression affects the physical body, as this plays a direct role in illness.

One major way to avoid feeling is to *inhibit the breathing*. When the breath is held, the lips stiffen or turn inward, the jaw clenches, the throat tightens, and diaphragmatic motion lessens. Normally, during full respiration, rhythmical waves travel up and down the chest and lungs all the way down to the abdominal area and even the base of the spine. But when feeling is suppressed, respiration is confined to the chest area and abdominal movement is restricted. The abdominal muscle contraction limits peristalsis, the normal wave-like motion of the intestines. A tight abdomen causes the intestinal wall to lose its muscle tone. As a result, the digestive tract becomes sluggish, causing the putrefaction of food and inflammation of the intestines.

Shallow breathing also brings less oxygen to the cells. This depresses the immune response, thus encouraging harmful anaerobic microbes to thrive. The red blood cells also lose some of their electrical charge, which causes them to clump together, become flattened instead of round, and lose some of their ability to carry whatever oxygen is still remaining in the body.

Stress and Anxiety, Calmness and Happiness

Stress is related to our response to our environment. Enough energy to deal with input equals less stress, while not enough energy equals more stress.

The body's systems are so interrelated that the stress induced by negative thoughts can contribute to, or even cause, health problems. These include elevated cholesterol and triglycerides, heartburn, decreased nutrient absorption, and food allergies/intolerances. It's common for stress to affect the digestive processes because an outpouring of stress hormones diminishes the gut flora population, digestive enzyme levels, and the amount of blood reaching the digestive tract. The stress-related "butterflies in the stomach" feeling is why people are advised not to eat if they're upset, anxious, fearful, or angry. Pessimism, negative thoughts, and the inability to deal with stressors release cortisol, an adrenal stress hormone.

Feeling centered, serene and content, on the other hand, benefits us physiologically and physically. This inner peace lowers the risk of heart disease, boosts immune function (hence reducing the chance of developing infections), and keeps us energized and willing to engage the world. Optimism, positive thoughts, and the ability to respond appropriately to stressors release serotonin, a neurotransmitter (brain chemical) that creates a sense of well-being. The ability to remain calm also equals greater alertness and focus, as more nerve connections are being formed in the brain.

Researchers are now finding that stress is "contagious." If you're around other people who are stressed, you can become more stressed and anxious yourself. However, the inverse is also true. Being around people who are tranquil and content can help you connect to that calm, serene place inside of you.

Emotional constriction causes major adrenal gland malfunction as well. Normally, during a fight-or-flight response, the body shifts into combat (fight) or running (flight) mode. Blood travels away from the stomach and other internal organs to the periphery of the body so we can use our legs for running and our arms for attack. (The decrease of blood in the stomach area impedes digestion, which is why it's unwise to eat when you're afraid, angry, or stressed.) The pupils of the eyes dilate, allowing more light to enter so we can see the danger before us more clearly. (This is the origin of the expression, "blinded by fear.") After the danger has passed, the body returns to its original state of dynamic equilibrium.

Some people, however, are in a state of continual crisis. This is a contradiction in terms, because by definition

crisis is sudden, short-term danger. If the crisis persists long enough, the adrenals don't rest and they ultimately lose their ability to function properly. Also, the cells that contain receptors to adrenaline and cortisol remain in a constant state of agitation because they receive messages to remain alert to a danger that never materializes.

Being vigilant without relief is emotionally draining and physiologically exhausting. Eventually, the extreme adrenal fatigue drastically reduces the levels of fight-or-flight hormones, and the underlying emotion tends to be uneasiness and low-level anxiety rather than outright fear or terror. But by now, the person has become literally poisoned by his or her own fear.

Medical doctor Mona Lisa Schulz describes the role of the adrenals in converting negative emotions into physical symptoms, to which we give the names of specific diseases:

When we're under stress, or feeling certain stressful emotions, our brains [tell the adrenal glands to] release the hormone cortisol. Chronic stress or any chronic emotion—anger, hostility, fear, or sadness—is an important factor that will cause the body's adrenal glands to start to express those emotions in symptoms mediated by cortisol. Chronically elevated levels of cortisol are known to change the behavior of certain organs. The arteries begin to get stiff and hardened (arteriosclerosis). Hostility, a specific form of anger, is an emotion that's associated with hardening of the arteries. Chronically elevated cortisol has also been related to cancer. The cancer can affect various organs depending on what situations or settings the emotions occur in.²²⁵

All immune-related cells produce—and have receptor sites for—the same chemicals that control emotions in the brain. Therefore, suppression of emotion is synonymous with suppression of immune response. Schulz describes the role of stress in immune disorders:

The immune system . . . requires adequate levels of cortisol to function properly. This means that we need a certain amount of stress or stimulation in our lives to function efficiently and to feel alive. Otherwise we go to sleep. . . . Excessive cortisol, however, can rev up the immune system dangerously. . . . You're constantly living on the edge of the cliff of fear and ignoring your body's language of fear—trembling knees, racing heart, and sweaty palms. . . . So your body begins to interpret the whole world . . . as something to be feared. It secretes more cortisol and begins to make immune cells and molecules against all the

dangers out there, real and imagined, reacting as though the outer world were a giant Petri dish of bacteria. You wind up making immune cells against everything. This is what happens with people who get chronic colds, chronic bronchitis, or chronic fatigue. Ultimately, because they're making so many excess antibodies, the antibodies turn against the body itself. The result is autoimmune disease, such as rheumatoid arthritis, lupus, or vasculitis.²²⁶

Along with holding the breath, another way to avoid feeling is to *inhibit expression*. The expression can be vocal—we exclaim with excitement, cry with grief, scream with fear, yell with anger, laugh when something is funny, and so on. Or the expression can be an act generated by the larger muscle groups. This includes running, hitting, hugging, and so on. Physical therapist and psychotherapist Elizabeth Noble writes that when someone's "inner desire to interact with his or her surroundings" is "inhibited by shame, guilt, panic, or defeat, . . . personal resources are not translated into movement." The muscle can either suffer from poor tone, representing "a lost impulse, a giving up before a movement was even begun," or the muscle can become tense because "the movement was initiated but then suddenly suppressed. . . . Certain muscles become active at specific phases of development, therefore variations in muscle tone provide a map of a person's preverbal being."²²⁷

Damage can occur to both flaccid and taut muscles. On a short-term basis, one might experience "only" physical tension, exhaustion, or aches and pains. Over a longer period, the emotionally-based tension impedes circulation, further decreasing the supply of oxygen to the cells.

Tension also contributes to disease by slowing lymphatic drainage. The section on **Exercise** explained that the lymph system, without a heart to pump waste through the blood vessels, can move only in response to exercise or massage. Muscles that are chronically held due to emotional holding patterns impede movement in the lymph vessels. It's common for emotionally contracted people to suffer from congestion of the lymph nodes.

How can a person possibly remain contracted for such long periods of time? Fear is an effective (if ruthless) teacher. Tightening the muscles and restricting the breath saps one's focus, so it cannot be maintained indefinitely on a conscious level. The musculature, obeying a now forgotten message, retains its contracted state because there is no longer energy available for expansion and relaxation. This response is now completely automatic—the point at which suppression by the conscious will is transformed into unconscious repression.

The stiffness and lack of easy, flowing movement in the body reflects the emotions that originally caused it to freeze. In turn, the body's rigidity causes even more emotional blockage. The muscles from which the energy has been withdrawn are more than simply chronically contracted—they also prevent us from *expressing* that emotion. Eventually, contraction prevents us from knowing what the original feeling was, from being aware that it existed, or even from recognizing that we are holding back! Body-oriented (body-mind) psychotherapy can help not only by addressing issues cognitively and behaviorally, but also by working with physical blocks through touch—thereby catalyzing emotional release. In today's stressful world that trains people to be emotionally closed, working with emotions on a regular basis with a trained professional may help. (See Chapter 5, page 650, for Wilhelm Reich's chart on the physiology and biochemistry of the relaxation and fight-or-flight responses.)

Sometimes physical stresses are caused by work-related injuries, such as constant heavy manual labor (as with construction) or repetitive motion (typing at a computer). Bodywork that focuses overtly on physical problems such as injuries and mechanical dislocations may be preferable to emotionally-based work if the source of the problem is physical. Whichever is needed, giving the body what it needs helps it to repair itself. It's beyond the scope of this book to address bodywork in depth, so I will present just a few highlights of some effective modalities.

Massage

In many Western cultures that de-emphasize—and even outright discourage—the need for touch, it's not surprising that massage is underrated. In the United States, before massage centers became mainstream (and franchised), people sometimes regarded massage therapy as an exotic luxury, or as something weird and kinky. In truth, massage therapy is neither. Performed correctly, it can be a vitally important therapy for healing.

Massage and touch were regularly used in hospitals from the 1800s through the 1940s until the public became dependent on pharmaceuticals, and the focus in medicine shifted from the human healing element to technology. Although massage therapy is meant to overtly address the physical aspects of health, it also "touches" the underlying unresolved emotions that make us tense. Massage has many benefits. It relieves aches, pains, cramping and stiffness in the muscles. It reduces pain and swelling in injuries. And it increases joint flexibility and the capacity to move with greater ease. These benefits are due to the following physiological and biochemical effects:

The Power of Positive Touch

A massage therapist friend named Martin told me a remarkable story about one of his clients, a pregnant woman whom he massaged five days a week, every single week of her pregnancy. “She wanted to do everything possible to help the baby,” he declared. “I did deep tissue work, spending lots of time on her belly to open up and relax the area.”

It turned out that Martin was really administering to two clients—the pregnant woman *and* her infant—for at the end of the nine months, the baby had clearly been affected too. Martin described the mother’s labor. “She gave birth almost instantaneously. It took exactly one-half hour from the start of her contractions to when the baby popped out. The doctor couldn’t even put on the second glove, it happened so quickly.”

I asked him what the infant was like. “I have never seen a baby like this,” Martin replied. “By the end of four months, he cried every time he needed to eliminate. His mother would hold him over the toilet and he would go. When he started eating solid food, his mother fed him mostly organic, but not always. If the food wasn’t organic, he’d spit it out.”

What about the baby’s development? “He walked at the age of one year,” Martin reported. “Now at age two, he speaks in complete sentences, English and Chinese” (the parents’ native language).

Is the child happy? “Very,” Martin said. “He’s content to play by himself for hours. He’s a remarkable little boy. I don’t know if all those massages were responsible, but the mother is convinced they made the difference.”

- ◆ Chronic pain is reduced or eliminated due to increased blood flow, lymph flow, and endorphin production.
- ◆ Toxins are eliminated due to increased lymph flow.
- ◆ Waste materials are eliminated from the bloodstream due to improved circulation, which brings more oxygen to the cells.
- ◆ Immune function is improved due to increased production of endorphins.
- ◆ Relaxation, a sense of well-being, and better sleep are promoted—along with the alleviation of anxiety and stress—due to the increased production of endorphins.

During most types of massage, the client is draped with a towel or sheet except for the part of the body that the therapist is treating. However, there are many types of massage, and with some the client can remain clothed.

Probably the most well-publicized massage technique is Swedish. Its main purpose is to move the lymphatic fluids, which helps the body eliminate toxins. (See **Detoxification** later in this chapter for details.) While lymph drainage is very important, a versatile massage therapist can address other physical problems too. Many people could benefit from deep, yet gentle pressure to help unwind the tissues. Trigger Point Therapy, based on the innovative work of Janet Travell, is a good example. Specific points in tender muscles are pressed and released, which opens energetic blocks, discharges pain, and provides greater freedom of movement in apparently unrelated areas of the body. Neuromuscular Therapy, which focuses on posture as a diagnostic tool, addresses particular areas with gradual pressure to eliminate chronic pain and improve posture. All massage can help muscles create more cells and thus regrow—even in the opposite limb that’s not being massaged!

A good massage consists of more than simply smearing oil on the skin. People who are unimpressed with massage may have been exposed only to a light Swedish technique, rather than other forms of more effective deep tissue work and medical massage. A very close friend of mine is an excellent massage therapist, with over two decades of experience. Once I slipped and fell, and was limping in pain. After just one massage from him, I was astonished at how much more easily I could walk, pain-free. If you don’t feel drawn to massage, you probably never had a session from a well-trained, experienced massage therapist.

Myofascial Release

Fascia is the name for the thin, moist membrane that surrounds all of the muscles. Typically, there are several muscles grouped together inside of one individual fascial sheet. Fascia is also known as *connective tissue* for good reason: it separates and supports the muscles as they glide back and forth inside their envelope. Bodyworker Deane Juhan explains that the fascia encapsulate:

cells into tissues, tissues into organs, organs into systems, cements muscle to bones, ties bones into joints, wraps every nerve and every vessel, laces all internal structures firmly into place, and envelops the body as a whole. In all of these wrappings, cables and moorings it is a continuous substance, and every single part of the body is connected to every other part by virtue of its network.²²⁸

The fascial network, as it turns out, plays a significant role in rifting (see Chapter 4). But independent of rifting, the part that fascia plays in bodywork is worth noting.

Ideally, muscles should slide along, and move inside of, this flexible envelope with ease. When a muscle is stuck to its fascial sheath, it can no longer move correctly. Sometimes people incorrectly interpret this restriction of movement as resulting from muscular malfunction, rather than from glue-like adhesions that fuse fascia to the muscle. Once the muscle is free and its natural rhythm of movement is restored, the pain usually vanishes.

Not all massage therapists work with the fascia, although from my perspective, massage should routinely include fascial release. Some modalities focus solely on the fascia. One such technique is called Myofascial Release.

Myofascial Release is based on the work of Ida Rolf, who taught her students how to release the fascia through a technique commonly known as Rolfing. Having the fascia kneaded can be painful, but the increase in mobility can be profound, resulting in a complete change in posture.

The fascia can also be affected without being physically kneaded; see below.

Oriental Energy Modalities

Acupuncture and Acupressure

Oriental methods are quite different from Western massage. Instead of moving lymph or trying to tone muscles, most of the healing arts from Asia address the movement of *chi* (sometimes spelled *qi*, both pronounced “chee”) along the energy channels in the body, commonly known as *meridians*. Obstructions to this flow of energy, a deficiency of energy, or an excess of energy, affect the functioning of muscles, organs and glands. This contributes to, and even outright causes, health problems.

Acupuncture, one aspect of Traditional Chinese Medicine (TCM), is probably the most well-known of all the Oriental techniques that help balance energy. Tiny thin needles, placed in specific points along the meridians, manipulate and conduct energy (*chi*) through the body. (One practitioner analogizes the needles as literal antennas that make scalar wave energy more available to the physical body. See Chapter 4, page 215, for more information on scalar waves.) Acupressure modalities of Shiatsu, Jin Shin Do and Jin Shin Jitsu are similar to acupuncture; but instead of needles, hand pressure is applied to the meridians and acupoints. Shiatsu follows the meridians of acupuncture, while Jin Shin Do and Jin Shin Jitsu follow other channels that connect the main meridians to each other. Tui-Na (from China) is among many other modalities that also work with the body’s energy channels.

TCM teacher Daverick Leggett describes the function of the meridians:

The meridian permeates its associated organ along its pathway and we may consider the physical organ to be part of the meridian. The meridian/organ is an aspect of Organ, which in Chinese medicine is a set of related functions. So the meridian may be defined as a structural aspect of Organ function. It exists to integrate the function of the Organ with the physical body and is the means by which the Organ is made flesh and translated into movement.²²⁹

Meridians are real. They’re not some abstract, invisible, intangible lines of mystical energy that seem to connect different areas of the body. However, because meridians don’t follow the known pathways of the circulatory, lymphatic or nervous systems, for years allopathic doctors ridiculed Oriental techniques and denied that meridians even existed—despite the fact that acupuncture has been used successfully for thousands of years! Finally, with instruments sophisticated enough to take readings of the electromagnetic energy along the meridians and at the acupoints, no one can argue that these channels exist, and that they react very differently from ordinary tissue.

Meridians manifest physically in several ways. The layers of skin are thinner along meridians. The ends of nerves along the channels are connected to specialized cells called *mast cells*, which are involved in inflammation and allergic responses. And meridians are more responsive than other tissue to electric current and infrasound.

There’s a very real anatomical aspect of meridians. In the previous discussion of Myofascial Release, I mentioned *fascia*—thin sheets of connective tissue, covering groups of muscles that slide back and forth in these membranous envelopes. As it turns out, meridians appear along the fascia between muscles, muscle and bone, or muscle and tendon. In 1999, German medical doctor H. Heine wrote:

Recent anatomic research has shown that therapeutic effects of acupuncture may well be explained scientifically: . . . acupuncture points (APs) are characterized by a nerve-vessel bundle wrapped in a sheath of loose connective tissue... Eighty-two percent of all classical AP[s] are . . . perforations of the superficial body fascia pierced by a nerve-vessel bundle. In body areas not covered by this fascia (i.e. face, skull, fingers and toes) the principle of the mesenchyme-covered nerve-vessel bundle can also be demonstrated for APs.²³⁰

Connective tissue cleavage planes were also identified by two researchers at the University of Vermont College of Medicine. Using ultrasound imaging, they found an 80% correspondence between the locations of acupuncture

points and those of connective tissue planes. Also, as early as 1977, an article called “Trigger points and acupuncture points for pain: correlations and implications” appeared in the journal *Pain*. The authors understood that:

trigger points associated with myofascial and visceral pains often lie within the areas of referred pain, but many are located at a distance from them. Furthermore, brief, intense stimulation of trigger points frequently produces prolonged relief of pain. . . . Trigger points and acupuncture points for pain, though discovered independently and labeled differently, represent the same phenomenon and can be explained [by] . . . the same underlying neural mechanisms.²³¹

“Now we know that acupuncture points (and it seems the majority of trigger points) are structurally situated in connective tissue,” writes an osteopath-naturopath, “but how does application of a needle or pressure in one part of the fascia translate to distant sites? How does the fascia communicate with other parts of the body?”²³² Leggett responds:

The flow of qi in the meridians is best described at the physical level by the flow of electrons. The interstitial fluids [fluids between the cells] of the fascia, which feed in and out of the lymph and capillary systems, may also be seen as part of the flow of qi through the body.²³³

“The fascial system,” writes another acupuncturist, being a continuous sheet of connective tissue, permits a virtual connection of all the cells of the body. . . . Bioelectricity and biomechanical energy can be conducted to any part of the body through the fascia. *The meridians are the energetics of the fascial system.* . . . Through the stimulation of acupoints, we are creating an effect on the fascia of the body. [emphasis added]²³⁴

It’s no accident that 80% of acupuncture points are also used as myofascial trigger points in other therapies. The relationship of the meridians to fascia helps explain why acupuncture helps improve muscle function (because it releases the fascia), and why direct massage of the fascia helps increase energy (because it stimulates the meridians).

Western medical doctors most often use acupuncture for pain relief. Acupuncture stimulates the pituitary gland to release endorphins, hormones that block pain. However, meridian therapy also helps heal gastrointestinal, hormonal, neurological and emotional issues, and even microbial infections. The importance of the fascial network cannot be underestimated. Leggett writes:

How we see the meridians reflects both the strengths and limitations of our practice. The plumber, seeing the meridians as pipes, will better be able to understand the distributive function of the meridians as they carry nutritive qi to feed the body. The electrician, seeing the meridians as wires, will better understand their communicative function as they carry impulses. The engineer, seeing the meridians as framework, will understand their role in supporting the body structure.²³⁵

Qigong

For those who want to improve the flow of qi through their meridians, but dislike needles and don’t want to depend on practitioner visits to improve their health, there’s the ancient art of *qigong*. The Qigong Institute website describes qigong as a “moving meditation for prevention of illness, reducing stress, and managing chronic illness.”²³⁶ Qigong is a dance for one, consisting of slow, flowing movements and intentional breathing that’s focused on different areas of the body. The combination of movement, deep breathing, and mental focus engages the meridians (and stretches the fascia), thus allowing energy to flow more evenly to all of the organs, muscles, and bones. By eliminating energy blockages, qigong not only alleviates stress, but can be used to treat degenerative conditions and serious diseases.

For centuries, all qigong forms were part of an esoteric, heavily guarded spiritual tradition. By the mid 1970s, the practice became more accessible to people both inside and outside of China. Modern qigong focuses on the improvement of health rather than the esoteric arts. Tai chi is probably one of the most well known forms of qigong, but there are over one hundred different styles (some ancient forms, and some modern), each with its own focus, philosophy, and movements. One form, Chi-Lel™ qigong, has the largest medicine-free hospital in China. People are taught to heal themselves using various movements, but the seriously ill can receive treatment from experienced practitioners. On one videotape, a few practitioners use their hands to transmit energy to someone with a tumor, while a live, real-time ultrasound picture shows the tumor rapidly shrinking and disappearing in fewer than five minutes. The hands are the primary transmitters of qi, but other parts of the body are used to transmit energy as well. The books sold on the Chi-Lel™ Qigong website, chilel.com, contain many inspiring testimonials of people who healed serious conditions using qigong.

Those who practice qigong faithfully say that their health improves. Their medical records indeed show this. They also feel empowered because they take their health into their own hands, literally.

The Psychology of Adrenal Stress

Adrenal fatigue affects every aspect of our lives. In this edited excerpt from his book, *Freedom From Lyme Disease*, Bryan Rosner shares the psychological fallout of adrenal fatigue—what he calls “my own journey out of that deep, dark hole.”

When my adrenals were at their worst, I was simply in survival mode. Worn down adrenals cause horribly unpleasant symptoms such as near-panic level anxiety, terrible insomnia, a sense of impending doom, inability to deal with even the smallest daily tasks, severe depression, and explosive relational interactions. . . to name a few.

My first few months of recovery involved taking lots of Vitamin C and B vitamins, consuming plenty of animal fat and protein, sleeping a lot, resting a lot, and trusting that things were going to be okay. More than anything, it was important for me to forgive myself for lost productivity, missed life opportunities, and other losses that were incurred during this time. A sense of guilt and inadequacy are extremely common symptoms during severe adrenal fatigue, so it is important to recognize these emotions as symptoms of the condition, not as a true reflection of one's own self-worth. Extending grace to one's self during recovery is so important. . . .

People with adrenal fatigue are typically also perfectionists and people pleasers. These patterns of behavior tend to weaken the adrenal glands, because we experience anxiety and stress when those around us are displeased with us, or at least when we think they are. We also experience anxiety and stress when our expectations of perfection in people or situations are met with the reality that people and situations aren't perfect.

Weakened adrenals cause symptoms of emotional instability, which makes us even more susceptible to our perfectionist and people pleasing tendencies. So, you can see that it can become a vicious cycle.

Recognizing this pattern is very important. Since ultimate self-acceptance can never come from an external source, our anxiety and stress can never be quenched by other people. Likewise, people and things will never be perfect, so our anxiety and stress will never be quenched by discovering perfection in our lives. We must extinguish the anxiety and stress with acceptance: acceptance of ourselves, and acceptance of the imperfect people and things in our lives. . . .

In addition to the unhealthy feelings involved in perfectionism and people pleasing, there is also an unhealthy level of work, energy expenditure, and effort. Perfectionism lacks a finish line, or end goal, to life's activities and interactions with others, so perfectionists never grant themselves rest. . . . People

pleasers and perfectionists never feel like work is done, settled, good enough, or acceptable enough. We always feel like more could be done, should be done, and must be done. Guilt drains us like no other emotion. . . . We must set reasonable goals for ourselves, and after we've met those goals, rest and ignore the voice that tells us, “No! You haven't done enough! You should be doing more!”

People who have adrenal fatigue, perfectionist tendencies, and people pleasing traits must work very diligently to change the way they think about the world. . . . Tell yourself and learn to believe the following statement: “Doing my best is good enough. After I do my best, I deserve rest, down time, and sleep. Taking care of myself is a worthy priority.” Until you really believe this statement, you will be susceptible to continued drain on your adrenal glands. Like a slow leak in a tire, that drain will prevent you from making forward progress.

We must also diligently look for other areas of our lives that may be causing a slow leak, or drain, on our adrenal glands. Past events, even those that occurred decades ago, may still be draining us emotionally. [Lack of] forgiveness, guilt, shame, regret, and other feelings might be causing low-grade anxiety and keeping our adrenals from recharging completely. It may even be possible that we've been living with these feelings for so long that we don't immediately recognize them when conducting an inventory of our state of mind. . . . *Any kind of emotional distress, even at a very low level, places a small drain on the adrenals and must be addressed and healed if the adrenals are to fully recover.*

. . . [If] we have not intentionally chosen a healthy lifestyle to model our lives after, we will instead follow the “lowest common denominator” examples in our society and culture . . . intentionally put in our path by corporations and their marketing departments. The single and primary goal of corporations is to relentlessly convince us that we are inadequate, dissatisfied, un-whole people who will be fixed by the products they offer. If we listen to this message, we start to believe it. We start to think that we really don't have enough—enough money friends, vacations, good looks, talents, or fill-in-the-blank attributes. This dissatisfaction creates a desperation to change our circumstances and gain more acceptance and approval from society at large. So we increase our work loads, spend less time relaxing and taking care of ourselves, and set off on the busy task of filling our lives with more—more of everything.

This pattern of behavior is one of the primary triggers of adrenal fatigue.

CranioSacral Therapy

One Western technique that in many ways matches the subtlety of the Eastern modalities is CranioSacral Therapy (CST). The seeds of CST were first sown in 1970, when osteopathic physician John E. Upledger assisted during a neck surgery and observed a subtle but unexplainable rhythmic movement of the head, neck, spine, and tailbone. Intrigued, Upledger did some research and discovered the theories of Dr. William Sutherland, who in the early 1900s had declared that the bones of the skull are constructed to allow for movement. From 1975 to 1983, Upledger expanded and refined Sutherland's theories by working with anatomists, biophysicists, bioengineers and physiologists at Michigan State University, where he was a Professor of Biomechanics. The research team confirmed the existence of cranial bone motion and described its mechanism. From this research, Upledger developed a therapy to correct the motion when it became stuck.

The craniosacral system is a pump. It consists of membranes and cerebrospinal fluid that surround and protect the brain, spinal cord and attached bones—the skull, face and mouth (the *cranio* or *cranial* part), down to the tailbone or sacrum (the *sacral* portion of the therapy). The craniosacral system is often compared to the pulse

of the cardiovascular system due to its intrinsic natural rhythm that can be felt throughout the body. However, the craniosacral system doesn't always function properly. Restrictions in the rhythm are fairly common, resulting in a halted flow of bioelectrical impulses. This means incompletely or incorrectly transmitted messages from one part of the body to another. Not surprisingly, poor function of the brain and spinal cord can cause sensory, motor, and neurological disabilities.

The goal of CST is to improve central nervous system function. Using a soft pressure of about 5 grams (the weight of a nickel or other small coin), a skilled CranioSacral Therapist detects irregularities or stoppages in the rhythm at key points along the head and spine. Corrections, done with a similarly light touch, help the body release restrictions and blockages and make corrections on its own. The therapist does not decide how the body needs to correct itself, but instead follows the movements of the body as it unwinds, layer by layer.

CST has been used for a wide range of medical problems, including migraines, temporomandibular joint dysfunction (TMJ), chronic neck and back pain, digestive disturbances (including colic), mental and emotional problems (autism, post traumatic stress disorder and learning disabilities), insomnia, fatigue, and neurological damage (including brain and spinal cord injuries). Many people who get better with CST have had chronic injuries that weren't helped by other therapies.

All types of practitioners are taught CST: naturopathic, osteopathic and medical doctors, chiropractors, doctors of Oriental medicine, psychiatrists, psychologists, dentists, physical therapists, occupational therapists, nurses, acupuncturists, and massage therapists.

CST is extraordinarily gentle, making it ideal for children and for infants suffering from birth trauma. This therapy is also especially beneficial to people with head, neck or back injuries. CST not only safe, it's effective. This is a good example of "less is more."

Chiropractic

While chiropractic does deal with the central nervous system, it's quite different from CranioSacral Therapy. Chiropractors specialize in realigning the skeletal structure—particularly the spine—to release any nerves that are pinched or compressed so that nerve impulses can again flow unimpeded throughout the body.

Chiropractic was discovered in 1895 by D.D. (Daniel David) Palmer during an encounter with a man who operated a janitorial service in the office building where Palmer worked as an energy healer (called a "magnetic" healer at that time). Palmer restored the man's hearing by

The Truth

We chiropractors work with the subtle substance of the soul. We release the prisoned impulse, the tiny rivulet of force, that emanates from the mind and flows over the nerves to the cells, and stirs them into life. We deal with the magic power that transforms common food into living, loving, thinking clay; that robes the Earth with beauty, and hues and scents the flowers with the glory of the air.

In the dim, dark, distant long ago, when the sun first bowed to the morning star, this power spoke and there was life; it quickened the slime of the sea and the dust of the Earth and drove the cell to union with its fellows in countless living forms. Through eons of time it finned the fish and winged the bird and fanged the beast. Endlessly it worked, evolving its form until it produced the crowning glory of them all. With tireless energy it blows the bubble of each individual life and then silently, relentlessly dissolves the form, and absorbs the spirit into itself again.

And yet you ask, "Can chiropractic cure appendicitis or the flu?" Have you more faith in a knife or a spoonful of medicine than in the power that animates the living world?

—B.J. Palmer
chiropractor (1882–1961),
and son of the inventor of chiropractic therapy

moving back into place some bones in his middle spine—untwisting nerves that had been so compressed, the man had been deaf for 17 years. It was D.D. Palmer's son, Bartlett Joshua (known as B.J.), who brought chiropractic from obscurity to the public as a bona fide profession.

It's amazing what can be accomplished in the hands of a skilled chiropractor. Unfortunately, chiropractic adjustments are still ridiculed and opposed by many allopathic doctors, who are so fixated on breaking the will of (as they see it) an uncooperative body, they cannot conceive that if the body receives the gentle and supportive guidance that it needs, it can correct and heal itself.

When the spinal vertebrae are out of alignment, it's called a *subluxation*. Extensive documentation shows that correcting the subluxation can cause many positive physical changes and improve a wide range of conditions. Aside from the elimination of pain in the arms, legs or back, chiropractic can help clear many serious conditions including colitis, sinus infections, and indigestion. Adjustments can even improve poor vision, sharpen reflexes, and restore memory.

These apparently magical changes are not mysterious once you realize that all of the nerves governing voluntary and involuntary processes in the body meet at the spine. If one of the bones (vertebrae) in the spine compresses a nerve, the amount and kind of information traveling to the specific organ, gland or muscle at the end of the nerve chain will be severely compromised. Like massage therapists, chiropractors—with a few exceptions, depending on the laws where they are practicing—do not diagnose or treat disease. They free the stuck bones that impinge on the nerves that interfere with the body's function. One chiropractor writes:

[Chiropractic] is based on the deductive principle that the universe is perfectly organized, and that we are extensions of this principle, designed to express life (health) and the universal laws. Since vertebral subluxations (spinal-nerve interference) are the grossest interference with the expression of life, the practice of chiropractic is designed to analyze and correct these subluxations, so that the organism will be free to evolve and express life to its fullest natural potential.²³⁷

As with massage, the methods of chiropractors vary greatly, ranging from extraordinarily light, gentle and specific non-force techniques to the more common, rigorous thrusts that people normally associate with chiropractic adjustments. It's worth the effort to find a chiropractor whose temperament and techniques work for you. Proper care could avert a surgical procedure. And it might even save your life.

Rubinfeld Synergy

There may be an emotional component to the physical symptoms you're experiencing. The emotion might be from childhood. Or, it could be due to unresolved trauma; conflicts with family, friends or job; or present-day frustration and upset (perhaps over being ill).

Negative emotions that are not too emotionally charged and that are based on a recent or current situation, can often be diminished through talking. Ideally, your bodyworker is amenable to being a sympathetic listener. However, most bodyworkers are not trained to deal with intense emotions, based on past trauma, that may get stimulated. If you're a practitioner, even if you don't want to focus on helping your client deal with feelings that may arise, you still need to be comfortable enough with strong emotion to provide compassionate understanding (and remain centered if outbursts do occur). It would be helpful if all bodyworkers were required to receive training in how to process emotions (their own and their clients').

If you're a client, consider body-mind psychotherapy in addition to physically-oriented modalities. A good description of a body-mind approach is provided by Ilana Rubinfeld, who in the 1960s created *Rubinfeld Synergy*—a combination of Alexander Technique, Gestalt, Feldenkrais work, and other methods. Rubinfeld was not always a psychotherapist. Her new therapy was developed due to problems she encountered as a classically trained musician at the Juilliard School of Music, where she played viola, oboe and piano, and conducted orchestras. "This strenuous activity eventually took quite a toll on my body," she wrote. None of the students were taught "how to stand, how to move, [or] how to conserve our energy. . . . As a result, some of the other students and I developed back spasms. I went from doctor to doctor to alleviate the pain." The sprays and injections she received provided temporary relief, in time for a performance.

But then the pain would return. Finally, friends . . . recommended that I look into the Alexander Technique, a method designed to teach a more efficient use of the body. . . . During a lesson, [my teacher] Judy would make subtle adjustments in the way I was standing, sitting, or moving. She touched me with a unique touch which seemed to have a thought in it. I was very moved by what she did, but I had no framework with which to understand what was going on. [As I continued to "let go"—literally giving up control of my head and allowing Judy to hold my head for me] . . . I noticed that I kept feeling better.

One day . . . while Judy was touching me gently, I began . . . to sob from a very deep place.

She hadn't pushed or intruded; she had just put a gentle hand on me. After several sessions, since I was continuing to cry, she recommended that I go to a therapist. I followed her advice, in spite of the fact that therapy was not for "normal" people in those days. My Alexander teacher was helping my body feel better, but now I could not contain the emotions the work had released.

The analyst I went to was wonderful. But by the time I would get to him, the released emotions from the Alexander lesson could only be analyzed as a distant memory. So, I had one person who touched me but would not talk to me about it; and another who talked to me but would not touch me. Between the two of them, I created my own holistic therapist.

Today we regard it as obvious that the body, mind, emotions, and spirit are all connected. But only as short a time ago as 1960, this "simple" wisdom was considered esoteric.²³⁸

Our Healing Connection

In some parts of the world, bodywork modalities are not accepted—perhaps because some people associate touch with sex. The dissociation from our bodies, and from this most primal method of communication, is intensified by the mechanization of medicine. What was once intuitive, and more art than science, has been usurped by rigidity, dogma, and fear. Don't let shyness prevent you from experiencing these powerful and effective modalities. You can read books on massage, bodywork, and therapeutic touch for the layperson. Plus, you don't have to be a professional massage therapist to touch your loved ones in a healing way. We heal through touch more than we realize.

LIGHT AND COLOR

Our Therapeutic Sun (Full-Spectrum Light)

As far back in history as we know—from the Arabians and Chinese to the Incas and Aztecs—human beings have worshipped the sun as the source of life, fertility, and healing. Over three thousand years ago, an Egyptian priest-king founded a religion based on the sun god. Two thousand years ago, Zoroaster (Zarathustra) taught the Persians about the sun's power. Five hundred years later, in his health temple on a Greek island, the physician Hippocrates—known today as the "Father of Medicine"—used diet, rest, hydrotherapy, and exercise as his chief medicines, along with the sun. All over the world, solariums (enclosed sun rooms) have been found in the archaeological ruins of private homes.

The ancients were not the only sun worshippers. Less than a century ago, proponents of Natural Hygiene—a movement that reached its apex in early 20th century Europe, particularly Germany—advocated spending at least a few hours every day naked in the sun, to allow the entire skin surface to absorb the sun's healing rays. Natural Hygiene proponents advocated what were considered revolutionary practices at the time: fresh, raw foods; adequate exercise and sleep; a positive emotional state; moderation in outlook, word, and deed; and lots of time outside in the sun. In retrospect, it seems strange that all this common sense advice was thought radical. Bernarr Macfadden, the Natural Hygiene proponent in the United States (where it was called Physical Culture), wrote:

Whenever sick and wounded animals can do so, they place themselves where they can secure as much sunlight and sun *heat* as possible. . . . By doing so they recover with comparative rapidity.

Understanding that the mind governs the body is the first vital step towards understanding the body and its functions. The mind uses the body to translate thought into physical reality. A sense of oneself as being small can, through physical tension, transform even a tall person into a stooped, slumped, cramped, "small" person. Likewise, a sense of strength and power can cause a small person to move with such energy and expansiveness that his or her size becomes irrelevant and may even be unnoticed [as being diminutive].

The mind can re-educate the muscles in ways that are harmful or helpful. Through the mind, the process of physical degeneration can be reversed. We can eliminate the idea of the inevitability of disease. If we feel weak, small, or helpless, we can practice exercises—physical and mental—which give us a sense of expansiveness. If we notice any tendency in the body to improve, any sign that a process of degeneration is reversing, we should do everything in our power to encourage it. We can allow the body to become more at ease with itself, more flexible, and less stressed. Even if we have undergone damage to nerves or muscles, that tissue can be regenerated through a program of mental and physical exercises. To do this we have to work with both body and mind, so that the non-material concept of health is manifested in our material being. This takes a lot of work. The loving hands of a friend, therapist, parent, or mate can help bring healthy stimulation to our muscles and nerves.

—Meir Schneider
Self Healing: My Life and Vision, 1987

Humans, who may know nothing whatever of ultraviolet and infrared rays, or of the curative effect of these rays, likewise turn instinctively to sunlight and sun warmth, or to artificial warmth, when indisposed or ill.²³⁹

Our sun is actually a giant star that emits many different frequencies on the electromagnetic (EM) spectrum. The electromagnetic waves from the sun vary in length from 3,100 miles (4,990 kilometers) long for electric waves on the very low-frequency end, to 0.00001 nanometers for cosmic rays on the very high-frequency end. (A nanometer is one-billionth of a meter, and a meter is about three feet.) Most of the frequencies on the EM spectrum are invisible to the human eye except for the small band of visible light, which we see as colors. Visible light comprises a tiny portion of the sun's emissions. Sunbathers are familiar with the invisible ultraviolet or UV portion of the spectrum. (Although UV is sometimes called "UV light," it's not not visible.) The invisible infrared rays, which are the source of the sun's heat, comprise 80% of the sun's emissions. The so-called heat rays "are not heat in the ordinary sense," wrote John Harvey Kellogg, surgeon and creator of the electric light sauna cabinet, over one hundred years ago, "but a form of energy which is capable of being converted into heat, and which becomes heat when brought in contact with an opaque body—that is, a substance which offers resistance to the passage of the rays."²⁴⁰ The heat (thermic) rays from the sun are the visible red and invisible infrared rays. The specifically chemical (actinic) wavelengths, which cause biochemical reactions in living tissue, are the visible blue, visible violet, and ultraviolet rays. These different wavelengths affect virtually every cell of the human body, including the eyes, skin, and pineal gland.

Despite the sun's benefits, in the US people are avoiding it more than ever, fearing skin cancer. Sunscreen lotions, creams, and oils are selling in record amounts. It's easy to be alarmed by the rapidly rising cancer toll—currently one in three, and projected to soon claim one in two. But is the fear of the sun realistic? How could the sustainer of all life really be that dangerous? What is the basis of the Natural Hygiene claims that being in the sun can cure heart disease, tuberculosis and eczema—and in fact, almost anything that ails you? Moreover, if the sun is so healthful, how did we stray so far from the truth?

One reason given for avoiding the sun is (at the very least) skin damage and (worse) skin cancer, due to the

burning caused by overexposure to the sun's ultraviolet rays. However, as often happens, fears that initially might seem legitimate fall apart on closer scrutiny. Not all UV light is the same. Equally important, UV light cannot be analyzed in a vacuum. Let us continue.

Ultraviolet Wavelengths

For thousands of years, our ancestors utilized the sun's healing rays by sunbathing. Correct tanning technique involves gradually building up exposure to the sun so the skin has time to produce layers of *melanin*, a pigment that protects against sunburn. Light skin contains less melanin than dark skin, so fair complexioned people burn much more easily than darker people. Among light skinned folk, redheads and blondes burn more easily than those with auburn, brown, or black hair. Virtually everyone living in tropical countries around the equator is black, brown or olive skinned, an evolutionary adaptation. (Nevertheless, the sun does seem harsher than it was 30 years ago, probably due to higher levels of pollution; so sunbathing seems less pleasurable than it used to be.)

Most of the fear surrounding the danger of UV rays originated from frankly idiotic laboratory tests.

Optometrist Jacob Liberman describes them:

In 1981, . . . monkeys were tranquilized; then their eyelids were pried open with lid clamps. With the monkeys' pupils fully dilated, researchers beamed light into their eyes from a 2,500-watt xenon lamp [that contained high levels of UV radiation] for 16 minutes. . . . Although the results of the study showed that there was some retinal damage, it is hard for me to imagine that the researchers could have concluded anything else. They gave these monkeys a highly abnormal exposure to ultraviolet light *that would never happen in real life*. In real life, monkey's pupils and eyelids *would naturally adjust* to protect their eyes, *just like the pupils and eyelids of humans do*.

Another argument science makes against ultraviolet light is that it causes cataracts. The same kinds of studies on laboratory animals concluding that UV light causes retinal damage are frequently used to conclude that UV light also causes cataracts. Of course the eyes in these studies were damaged. Did they expect vision to improve? Similar studies, in which the skin

In the beginning there was nothing. God said, "Let there be light!" And there was light. There was still nothing, but you could see it a whole lot better.

Cancer and Biophotons

The existence of biophotons—quantum currents of low-level luminescent light that are transmitted by all living things for communication—was proven by German biophysicist Fritz-Albert Popp in 1974. He built the *photomultiplier* to measure these emissions.

In healthy tissue, biophotons are coherent and possess a natural periodic rhythm. In contrast, cancer cells are incoherent and lack these periodic rhythms. The body's innate photo-repair mechanism works best at the 380-nanometer (nm) wavelength. Not surprisingly, this wavelength is the one that cancer-causing compounds react to, scramble, and then re-emit at a completely different frequency.

To heal DNA, the correct frequency of light must be applied, which stimulates the body's photo-repair system. Interestingly, mistletoe, which is injected into cancerous tissue to eliminate it, emits a 380-nm wavelength.

of animals is repeatedly burned with high levels of UV light, also have been done to “prove” that ultraviolet light causes skin cancer. . . . It is impossible to come to valid scientific conclusions based on these experiments, because they are performed under extremely unnatural conditions that do not, and never will, exist in reality and would be considered highly abusive if they were attempted on humans. . . . *The abuse of the animals in their studies causes cancer, blindness, and death!*²⁴¹

Constant direct sun in the absence of protective nutrients, can damage the eyes and body. It's difficult to comprehend how any sane (or compassionate) scientist could conduct such atrocious experiments and believe that they have merit. “When too much oxygen is given to premature babies in their incubators, it causes blindness, deafness, and brain tissue damage. Fortunately, this has not resulted in any recommendation that we should try to get along without oxygen,” wrote the late Dr. John Ott, a widely respected pioneer on light and its effects on living organisms.

Yet that is exactly what is happening in prevalent views about ultraviolet. . . . Without doubt, too much ultraviolet is harmful—particularly the short-wavelength . . . ultraviolet that is mostly filtered out of sunlight [anyway] by the atmosphere, and especially the upper ozone layer. [However] fear of too much ultraviolet is causing many people to overprotect themselves from sunlight, to the point of creating a deficiency in a very essential environmental life-supporting energy.²⁴²

Ultraviolet wavelengths, discovered by the German physicist Johann Wilhelm Ritter in 1801, lie between visible light and X-rays. The UV radiation band itself is subdivided into three wavelength bands: near-UV (UV-A), Mid-UV (UV-B), and far-UV (UV-C). All of the rays within these ultraviolet bands can tan or burn the skin, but each bandwidth has its own unique properties. UV-A has the longest wavelengths, ranging from about 320 to 400 nanometers (nm). It's sometimes referred to as blacklight because of its ability to make colors glow in the dark. About 50% of these very long wavelengths penetrate to the blood vessels that feed the skin, while a tiny percentage penetrate considerably deeper. UV-B ranges from about 290 to 320 nm. These wavelengths activate, within the skin, the production of Vitamin D3, which among other functions helps the body absorb calcium, phosphorus, and Vitamin A. (See Sidebar, “Sunlight and Vitamin D.”) UV-C, ranging from about 100 to 290 nanometers, is largely blocked by the Earth's ozone layer. However, it's still a highly effective germicidal agent; many pathogens are killed by 254 nm. About half of the 290-nm wavelengths penetrate to just under the surface of the skin, while a very small percentage penetrates slightly deeper.

Within the medical community, UV is well known for its powerful germicidal abilities. In *Sunlight Could Save Your Life*, medical doctor Zane Kime writes, “Not only does the sun have a direct bacteriocidal effect on the skin, but it also changes the oils in the skin into bacteriocidal agents themselves. Even the vapors rising from natural skin oils . . . are capable of killing bacteria.”²⁴³ Scientists researched UV's germicidal capacity as far back as 1886 with *Bacillus anthracis* (anthrax), followed by *Pasteurella pestis* and *Streptococcus* in 1887. The bacteria for tuberculosis, cholera and *Staph* infections were tested by 1892; *E. coli* was tested in 1894; and *Shigella* (which causes dysentery) was tested in 1909. All of the researchers who exposed their germ colonies to UV light reported the same good news: UV light kills microbes involved in infectious diseases—perhaps, at least in part, because it stimulates the production of ozone in the body. Based on this knowledge, natural sunlight, and UV created by special lamps, were utilized for many different conditions.

In 1903, Swiss physician Auguste Rollier established the first European clinic in the Alps for the non-surgical treatment of tuberculosis using solar energy. This proved so successful that England, the US, France, Austria, Israel, Italy, and other countries established similar clinics. That same year, Niels Finsen from Denmark won the Nobel Prize for being the first person to successfully treat skin tuberculosis with UV therapy. Worldwide, doctors were prescribing sunbathing, often nude, for

people with erysipelas (a skin infection with a mortality rate of 10%), tuberculosis of the skin and bone, lupus, and other diseases.

Then in 1935, a researcher left Petri dishes of *Staph* in the open air of an operating room during the time that surgery was being performed. He collected the dishes after one hour, Kime reports.

Having suspended a bank of ultraviolet lights from the ceiling of the operating room, he found that all the bacteria within 8 feet of the lights could be killed in 10 minutes, even though the intensity of the lights was reduced to a point where blonde skin at a distance of 5 feet would not react with reddening until after 80 minutes of exposure.²⁴⁴

Knowledge that UV light remains beneficial for quite a while before its effects become destructive, and that the rays destroy germs in the air as well as on the skin,

led to widespread use of UV lamps to disinfect hospitals and clinics. In Russia, factory workers were exposed to special low intensity UV lights that weren't strong enough to cause reddening of the skin, but decreased bacterial contamination of the air by 40% to 70% and cut employee illness by half. Articles continue to report highly successful treatments for mumps, asthma, blood poisoning, viral pneumonia, childbirth infections, peritonitis, and even cancer. One study of people with tuberculosis showed that among those receiving UV treatment, three-quarters lived compared to about one-quarter of those treated surgically or by other allopathic methods.

The favorable results with tuberculosis inspired the practice of removing some blood from a subject, infusing it with UV light, and then injecting it back into the subject. Just a small amount of UV-treated blood can impart germicidal properties to the entire bloodstream, even those portions that were not extracted. This procedure is

Sunlight and Vitamin D

Vitamin D, which is widely known as a fat-soluble vitamin, is not a true vitamin. As scientists discovered relatively recently, Vitamin D is actually a hormone called *calciferol*. It's found in only a few foods—fish, eggs, raw butter, and animal fats (from naturally raised animals only, because factory farming deprives the animals of what they would eat in the wild and thus alters their nutrient composition). However, even when these foods are supplied, the body must still transform the Vitamin D before it can be used.

Even more important, the body makes this “vitamin” from the sun. When the sun's UV-B rays strike the skin, the cholesterol in the skin (which is more highly concentrated there than in any other part of the body) changes into Previtamin D. Then, with further sun exposure, the Previtamin D is transformed into several other substances that the body needs. Within twenty-four hours, half of the Previtamin D that has not been converted into other products is transformed into Vitamin D3 by the body's own heat, by the liver, and eventually by the kidneys. Vitamin D3 can be toxic in large amounts, but the body compensates for this in two ways. One, the vitamin is released very slowly, and two, excess Vitamin D3 always reverts back into Previtamin D.

This natural regulating process takes care of even high levels of Vitamin D3 produced by the body. On the other hand, *synthetic* Vitamin D—its D2 form, often added to commercially processed foods (through a technique called “fortifying”)—causes problems. When synthetic Vitamin D is consumed, people suffer bone loss because the body's absorption of calcium and phosphorous is impaired (though exposure to even minimal amounts of *sunlight* significantly increases the absorption of these minerals). At high enough levels, Vitamin D2 is toxic, even deadly. It can cause hardening of the arteries and calcification of the soft tissues in the body. Rats and mice fed the synthetic vitamin comprising 0.1% of their diet, died within 48 hours. “It would seem that the public should at least be offered the choice of receiving their Vitamin D safely from the sun, as nature intended,” reflects Zane Kime. “Supplementation of food with a hormone, the intake of which cannot be regulated, is in reality an example of a mass experiment. . . . This seems strikingly unnecessary when we can safely obtain all the Vitamin D that we need by just spending a few minutes in the sunshine. . . .”²⁴⁵

Unfortunately, just “a few minutes in the sunshine” isn't sufficient for most of us. In areas beginning 37 degrees too far north or south of the equator, the oblique angle of the sun doesn't generate sufficient Vitamin D-producing UV-B rays to help us produce calciferol. “The current suggested exposure of hands, face and arms for ten to twenty minutes, three times a week, provides only 200 to 400 IU (International Units) of Vitamin D each time . . . during summer months,” writes Krispin Sullivan. Although this amount will help prevent rickets in children, we require 4,000 IU every day to ensure the health of all vital functions. “What the research on Vitamin D tells us is that unless you are a farmer, lifeguard or a regular sunbather, you are highly unlikely to obtain adequate amounts of Vitamin D from the sun. The balance must be obtained from food.”²⁴⁶

Interestingly, most commercial sunscreens block ultraviolet-B (UV-B) but not ultraviolet A (UV-A). Preliminary research suggests that UV-B confers more benefits to the body and skin than UV-A.

more popular in Europe than in the US; but all over the world, UV is used to purify water systems.

UV radiation does more than kill germs. It stimulates the skin to create beneficial Vitamin D. It also inactivates excessive amounts of steroids, some of which accelerate the growth of cancer.

It can be difficult to separate the different properties of the sun's individual electromagnetic wavelengths because many rays augment and complement each other. Consider one known relationship between UV and another group of wavelengths, far infrared (FIR). Macfadden wrote:

Sunburn is not, in reality, a burn at all, for it does not appear for several hours after the causative exposure; it is simply an . . . inflammation resulting from irritation by the peculiar [biochemical] action of the ultraviolet rays. . . . [The Swiss physician Rollier] asserts that, because

his patients with deep-seated tuberculosis are cured when they become deeply pigmented and those who do not pigment respond far less favorably to the treatment, the pigmentation must render possible the deep penetration of the long [FIR] rays. This theory would suggest that the long, heat [FIR] rays are the curative rays, while the short, actinic [UV] rays *are merely servants preparing the way so that the heat rays may enter the body.* [emphasis added]²⁴⁷

That UV produces a biochemical reaction to escort FIR into the body makes sense, especially when you consider that *melanin*, the pigment created by the skin in response to UV, contains copper. Copper is such a good conductor of electricity that it's used in electrical wiring.

Now let's look at far infrared or FIR, and the larger spectrum to which it belongs, infrared.

The Truth about Sunburn, Skin Cancer, and Cataracts

In our so-called civilized world, we are taught that exposure to the sun will bring not only sunburn, but also cataracts and skin cancer. It's true that people have gotten sunburned and skin cancer from sun exposure, and that even minimal exposure to UV-B rays significantly increases the risk of cataracts. But, as researchers are discovering, these conditions occur much more frequently if one is eating fake food. Often, the effects of the sun's rays can be either harmful or healing *depending on the types of fats in one's diet.*

Royal Lee, the whole foods supplement manufacturer, discovered a substance primarily in oils that he called *Vitamin F*. People who did not consume enough Vitamin F, he said, were much more likely to develop thickening of the skin, sunstroke, canker sores (from the herpes virus), itchy skin, hives, and skin cancer. Many people who did get enough sun exposure to produce enough Vitamin D still developed those conditions. Therefore, Lee surmised, there must be another factor involved. What is usually considered a Vitamin D deficiency is actually a deficiency of Vitamin F—otherwise known as *polyunsaturated fatty acids* in scientific textbooks.

Vitamin F has specific functions that complement those of Vitamin D. Each balances the effects of the other. Vitamin D pulls calcium from the gut and the tissues and deposits it into the blood. Vitamin F pulls calcium from the blood and deposits it into the tissues. If a person has plenty of Vitamin D but no F—which occurs more often than the other way around—there will be abundant calcium in the blood but not enough in the bodily tissues. Insufficient Vitamin F in the tissues not only can augment health problems, but it will even *cause* them. (Of course, there must be enough calcium in the body at all times for the bloodstream, the gut, *and* the tissues, because calcium normalizes the body's immune response in addition to helping the formation of bone.)

It's easy to become deficient in Vitamin F if one eats the Standard American Diet (SAD) of fake food (junk food). In the manufacture of synthetic fats (margarine, shortening, and liquid vegetable oil), Vitamin F is destroyed, and misshapen fats called *trans fats* appear in the final product. The body cells, which are forced to work with what they are fed, surround themselves with straight trans fat molecules instead of the horseshoe-shaped Vitamin F fat molecules. The malformed, straight trans fat molecules literally create gaps in the cell membranes through which carcinogenic materials can enter relatively easily, as the cells no longer have adequate protection.

Fake fat molecules also reflect the presence of highly unstable atoms at the quantum level: free radicals. This means that lone electrons are knocking other electrons out of place—so that before long, electrons are acting like billiard balls, destroying the integrity of cells and decreasing their ability to metabolize oxygen. When the body is low in oxygen, all kinds of disease conditions can develop, including cataracts and cancer.

This is how the ingestion of the wrong kinds of fats—fake fats—can lead to illness. Despite what the food industry would like consumers to believe, the sun is not the culprit. If anything, being in the sun “sheds light” on what we may need to correct in our lifestyle.

Infrared Wavelengths

Like UV wavelengths, infrared (IR) wavelengths are also invisible. And they, too, exert incredibly powerful effects on living organisms.

As mentioned earlier, 80% of the sun's radiation is infrared, which provides heat. Even though IR from the sun is filtered by atmospheric gases, wavelengths still reach the Earth. Infrared radiation heats in a most unusual way. Rather than directly affecting the air itself, which is impervious to being heated, IR penetrates and warms matter.

As with UV, infrared emanations are divided into several categories. Near infrared, the shortest wavelengths, range between about 0.72 and 1.5 microns. Middle infrared, medium length wavelengths, range between about 1.5 and 5.6 microns. And far infrared, the longest wavelengths, range between about 5.6 and 1000 microns. (One micron equals one-millionth of a meter.) All matter above the temperature of absolute zero (minus 459.67°F, or minus 237.6°C) emits some degree of IR.

The heating properties of *far* infrared (FIR) were discovered in 1800 by German astronomer Frederick William Herschel when, in an attempt to measure the temperature of various rays of visible light, he put two thermometers outside the range of the visible light. The FIR rays, which are next to the red color band, turned out to be the hottest of all the wavelengths he tested.

Far infrared accelerates many biological functions in the body. It increases the number of lymphocytes, a type of white blood cell in the front line of the body's immune response. It also stimulates the lymphocytes to produce larger amounts of the biochemical interferon (which is so helpful in fighting infection that it has been synthesized by drug companies and given to people with various cancers). FIR increases the levels of enzymes (which immune cells use to transform and remove toxic chemicals). It increases the amount of hemoglobin in the red blood cells, helps the hemoglobin release oxygen and carry away carbon dioxide more easily, and helps the cells of the body to better utilize the oxygen they receive. FIR elevates the production of hormones—including thyroxine from the thyroid, which means a faster metabolism. Far infrared also helps the body produce the “signalling molecule” nitric oxide, which helps preserve the elasticity of the blood vessels (by telling them to either dilate or constrict), enhances immunity, and reduces inflammation. Of course, the heat from FIR is well known for relieving pain by relaxing the tissues.

For good reason, far infrared heaters are very popular in modern saunas. **Sauna Therapy** later in this chapter discusses FIR heaters in more detail. But for now, let's examine the effects of light on the body.

The Pineal Gland and Light

The human body's most obvious receptor to visible light is the eye. But two glands inside the skull are also affected: the pituitary and pineal. Until the last few decades, not too much was known about the pineal, a tiny pine cone-shaped structure deep inside the brain between the two cerebral hemispheres. Although the medical establishment recognized that the pineal secretes hormones involving growth (and possibly also skin pigmentation and sexual stimulation), it considered the gland inconsequential, and not worth further investigation.

In the third edition of the *Textbook of Medical Physiology*, Arthur C. Guyton writes: “Embryologically, the pineal gland [in the human being] is derived from a third eye that begins to develop early in the embryo.”²⁴⁸ This “third eye” is *literal*. Prominent in the first weeks of gestation, it appears in the center of the forehead just at the surface of the skin before it gradually recedes into the brain, leaving no discernable sign that it was ever there. In the tenth edition of the same textbook, Guyton writes, with co-author John E. Hall: “It is known from comparative anatomy that the pineal gland is a vestigial remnant of what was a third eye located high in the back of the head in some lower animals.”²⁴⁹

The dictionary defines *vestige* as “a bodily part or organ that is small and degenerate or imperfectly developed in comparison to one more fully developed in an earlier stage of the individual.”²⁵⁰ However, the ways in which messages are transmitted to, and translated by, the pineal can be subtle and complex. The “vestigial remnants” of the pineal on the skulls of birds are not only photoreceptor cells, but they also monitor magnetic fields, thus helping the birds to align their bodies in space for navigational purposes. In all mammals the pineal is directly responsible for normal mating behavior, ensuring that most of them become pregnant during the winter to allow for a spring birth when the young can be kept comfortably warm and well fed. In birds and lizards, the pineal absorbs light without relying on the eyes to feed it. A lizard's pineal manifests as a visible bump on the skull, and plays a role in the regulation of seasonal reproductive cycles. As for hamsters, Guyton and Hall report, the gland is so sensitive that “greater than 13 hours of darkness each day activates the pineal gland, whereas less than that amount of darkness fails to activate it, with a critical balance between activation and nonactivation.” The pineal in humans is “controlled by the amount of light . . . seen by the eyes each day.”²⁵¹

Although the pineal is stimulated differently in humans than it is in birds and lizards, the human gland plays an equally important role in development. All of these

functions are quite sophisticated for a “vestigial” structure! No wonder the French philosopher Descartes believed that the pineal was the seat of the soul. Similarly, Eastern philosophies refer to the center of the forehead, just above the eyes, as the psychic and spiritual center, otherwise known as the “third eye.” Nevertheless, conventional medicine does not fully grasp the role of the pineal in human functioning.

In humans, light travels through the eyes, along the optic nerve to the part of the brain that records visual impulses, and ultimately to the pineal, which converts it into hormonal transmissions inside the body. The pineal gland secretes several hormones, including dopamine, serotonin, and melatonin. Melatonin is the hormone that induces drowsiness. The levels, which increase at sundown, are plentiful during sleep—especially between 2:00 and 3:00 in the morning, when the hormone is secreted at ten times the amount of its lowest level. By morning the levels diminish, and they become even lower during bright daylight hours.

The ebb and flow of melatonin forms the foundation of our biological time clock. Besides regulating our sleep cycles, the hormone regulates metabolism, the menstrual cycle, and the size and function of the thyroid and adrenal glands. Melatonin also helps alleviate depression, decreases pain, maintains brain acuity, encourages immune response, and even slows the aging process. Newer research shows that melatonin not only scavenges free radicals, but it also inhibits the growth of many types of cancers, including breast and lung cancers, renal cell and hepatocellular carcinomas, and brain metastases from solid tumors. Melatonin also appears to lower LDL cholesterol levels. Some researchers suspect that unusually low melatonin levels are a factor in Multiple Sclerosis, coronary heart disease, epilepsy, and postmenopausal osteoporosis. These reports, while preliminary, further suggest the range of melatonin’s potential. The variety and scope of functions does not seem unusual, considering the pineal gland’s role as the receiver and transformer of light.

Light Therapy for SAD

It has long been observed that mammals set their biological clocks according to how much light the sun emits. In the Northern Hemisphere, the sun appears the least during the winter. In the Southern Hemisphere, the sun appears the least during the summer (the equivalent of a Northern winter). The farther away from the equator the land is, the less sunshine one receives. In parts of the world where the

seasons discernibly change and the sun is present for the fewest hours, all life undergoes a major biological shift. In animals, the metabolism automatically decreases. This causes the body to store fat and induces the animal to sleep or nap, in a period of complete or partial hibernation, until the Earth thaws and green plants grow again.

This evolutionary pattern makes sense for an animal when food is scarce and the animal needs to keep itself warm in a secure shelter. But the same adaptive mechanism in humans conflicts with our modern lifestyle. Most people hold jobs and have other responsibilities that do not allow them to slow down for introspection, spiritual renewal, or simple quiet time. Nonetheless, they suffer from a slower metabolism as though they were going into hibernation. Many people who overeat carbohydrates not only gain weight, but they also become irritable and fatigued. They sleep excessively, engage in less sex, and even suffer from lowered immunity.

As you might guess, it’s more than the cold that affects us adversely. So does the lack of adequate sun. This condition of light deprivation is called *seasonal affective disorder*, also known as SAD (not to be confused with the same acronym that stands for *standard american diet*). The acronym SAD is indeed appropriate because many people experience sadness—if not outright depression—due to the lack of adequate sunlight.

We can expect SAD to be practically non-existent in warm locations closer to the equator. However, SAD is common in the Scandinavian countries, Greenland, Northern Canada, and Alaska. The Earth’s tilt, together with its elliptical orbit around the sun, makes it receive the sun’s rays at an angle. This results in 24 hour periods of light during the peak of the summer, and 24 hour periods of darkness during the peak of the winter. (Hence, any of these countries are sometimes called “the land of the midnight sun.”) With such lengthy, unrelenting periods of darkness in these locations, there is a higher than normal incidence of depression and suicide.

It is the increase in melatonin production, due to fewer daylight hours, that’s responsible for SAD. This light-dependent hormone, so essential at night for its soporific effects, causes depression when too much is secreted at other times. (Therefore, if you use it to help you sleep, take just enough before bedtime. Usually, half a mg is plenty for most people. Melatonin supplements often contain more, so take only a little bit from the capsule.) SAD is such a worldwide phenomenon that the 1988 book, *The Hibernation Response*, is appropriately subtitled *Why You Feel Fat, Miserable, and Depressed from October through*

March—and How You Can Cheer Up Through Those Dark Days of Winter. (This book was obviously written for a North American audience living a fair distance north of the equator.) The entire book is devoted to strategies to counteract our genetic tendency to become sluggish, fat, and depressed during the hibernation periods. The primary treatment? Exposure to bright full-spectrum light, one-half to four hours every day, depending on the climate, the individual, and the severity of the condition. A similar program is recommended to help regulate a woman's menstrual cycle. Exposure to light at certain intervals can correct menstrual cycles that are too short or too long.

We harm ourselves by substituting artificial light for natural sunlight. Liberman writes:

Until 1879, when Edison perfected the light bulb, people spent most of their time outdoors and received adequate daily doses of natural, full-spectrum sunlight. Although Edison's invention was a quantum leap in technology, it simultaneously created a situation in which people lost respect for nature's daily light/dark cycle and began "burning the candle at both ends." With the growing availability of the light bulb, life became largely an "indoor event," which drastically reduced the amount of time to which people exposed themselves to full-spectrum light. . . . Artificial lighting and its effects on physiology and behavior obviously needs to be evaluated. By spending an inordinate amount of time under artificial lights, we may be subjecting ourselves to *malillumination*, in much the same way as we subject ourselves to malnutrition by eating an unbalanced diet.²⁵²

Liberman acquired the term "malillumination" from John Ott, one of his teachers (and the originator of time-lapse photography). Ott had some wonderful insights into how electromagnetic frequencies are used by the body. All nutritional substances and drugs, he wrote, have a specific wavelength at which they are absorbed. If those wavelengths are missing in the light source to which a person is exposed, "then no biological combustion will take place and the nutritional benefits of the particular substance will not be utilized."²⁵³ Liberman continues:

The European Society for the Study of Drug Toxicity has reported that the lethal dose rate for

most drugs is higher when administered during the daytime than during the night. We also know that light received through the eyes stimulates the pineal and pituitary glands. These glands control the endocrine system that regulates the production and release of hormones controlling body chemistry. This would then seem to me to be a carryover of the basic principles of photosynthesis in plants—sometimes referred to as a conversion of light energy into chemical energy—to animal life, a phenomenon not heretofore recognized. Thus the wavelengths

that are missing in various types of artificial light or that are filtered from the spectrum of natural light by window glass, windshields, eyeglasses (particularly tinted contact lenses or deeper shades of sunglasses), smog, and even suntan lotions, are causing a condition of malillumination, similar to the malnutrition that occurs when there is a lack of a proper nutritional diet.

Those minerals and chemicals in the individual cells of our bodies that would normally be metabolized by the wavelengths

that are missing remain in the equivalent of darkness, even though other wavelengths are present. The end result is an incomplete metabolic or biological combustion process.²⁵⁴

Ott spent years conducting research using *full spectrum* lighting, which contains all wavelengths (colors) emitted by the sun. Incandescent bulbs contain more of the yellow and red colors emitted by the sun. However, most fluorescent lights are too bluish. Compact fluorescent light bulbs, pushed onto a public fearful of global warming, aren't full spectrum either. (They are also extremely dangerous, as they contain mercury and do emit fumes when heated. Should they break, the mercury vapors released into the air cause serious neurological damage.) Ott found that mice and rabbits living under pinkish or bluish lights, compared to their full-spectrum-raised counterparts, developed much higher rates of cancer. School children exposed to normal blue-white fluorescent bulbs exhibited considerably more behavioral, emotional, and learning problems than when the classrooms were installed with full spectrum fluorescent lights (which were also specially shielded against unwanted X-rays that are normally emitted from the ends of the tubes). The students' aggression levels decreased and they became

NASA Light-Emitting Diode Technology Brings Relief In Clinical Trials

"We've already seen how using LEDs can improve a bone-marrow transplant patient's quality of life," said Dr. Harry Whelan, professor of neurology, pediatrics and hyperbaric medicine at the Medical College of Wisconsin.

—NASA Press Release 03-366
November 13, 2003

Until recently, it was believed that humans utilize exclusively glucose for energy, and that chlorophyll-rich green plants are the only organisms capable of converting sunlight into energy (a process called *photosynthesis*). We now know that the fuel-burning mitochondria in all tissue cells of humans are also capable of capturing and transforming sunlight into energy (ATP, or adenosine-59-triphosphate)—providing enough chlorophyll has been ingested. (Chlorophyll also reduces oxidative stress, which slows aging.)

Melanin may also help humans directly “harvest” sunshine. Known for coloring our skin, hair and eyes, melanin is abundant in the brain. Not only does it scavenge free radicals, but, sensitive to light, it acts as a semiconductor and has the ability to transfer charge.

Significantly, the sun’s radiant energy structures water (including the water in our bodies) into a liquid crystal, similar to what occurs in the first step of photosynthesis.

more peaceful and cooperative. Their blood pressure dropped an average of twenty points when they were beneath the full spectrum lights. Interestingly, even the behavior and attitudes of blind students improved—a testimony to the nourishing aspects of visible EM wavelengths that don’t rely on our ability to see them.

The sun provides all wavelengths. Most indoor lighting does not. Spending too much time indoors skews our biochemical reactions by depriving us of essential EM wavelengths. Ott cited many studies involving laboratory rats, bean seeds, plants, children, and adults. When exposed to X-rays, fluorescent lights and unshielded TVs and computer monitors (this was before flat screens), plants grew crooked. Children and animals became hyperactive, aggressive, irritable, and lethargic. Adults had physical problems including eyestrain, nausea, headaches, and backaches. The repercussions of malillumination are so extensive that some livestock raisers, whose animals remain indoors too much, install plastic windows that allow UV radiation into the barns and henhouses.

We need natural light in order to remain healthy. If you can’t lie naked in the sun, use full spectrum lighting. Repeated exposure to sunshine, the original healer:

- ◆ Destroys pathogenic microorganisms.
- ◆ Stabilizes blood sugar (diabetes and hypoglycemia).
- ◆ Reduces excess harmful cholesterol in the bloodstream.
- ◆ Reduces pain, in part by lessening harmful lactic acid buildup in the muscles.
- ◆ Slows, deepens, and eases breathing.
- ◆ Decreases the resting heart rate.
- ◆ Helps the lungs absorb more oxygen.
- ◆ Helps the muscles better utilize the oxygen that’s already in the body.
- ◆ Helps the body burn fat, even if an individual isn’t active, by stimulating the body to produce Vitamin D.
- ◆ Increases blood supply to the deep internal organs as well as muscles, due to the stimulating effect on the sympathetic nervous system.
- ◆ Normalizes hormonal levels in the body, which cause beneficial changes ranging from more rapid wound healing to stress reduction.

Why isn’t the public taught about light?

Single-Color Light Therapy

Sometimes an organism lacks not just sunlight (which contains a wide range of electromagnetic wavelengths), but a *particular* EM wavelength in the *visible light* range—which we perceive as a color. Ott once remarked that organisms respond to specific, narrow bands of particular wavelengths of visible light, “not just to the difference between light and dark”²⁵⁵—and that when specific wavelengths are missing from an artificial light source, “the biological receptor responds as if it were in total darkness, even though other wavelengths are present.”²⁵⁶ This points to the biological need for all colors.

We know, based on chloroplast response in plants, that green growing things require specific wavelengths. *Chloroplasts* are plant cells that are arranged in certain patterns and contain chlorophyll. Depending on the color of light shone on a plant, the chloroplasts will assume either orderly or chaotic designs. Corresponding cellular activity occurs in animals. In 1966, looking through a phase-contrast microscope, Dr. Ott saw that the biological responses of live rabbit eye pigment cells changed, depending on the color filter he was using. “If a particular ailment can be treated with certain wavelengths of light,” Ott remarked, “we might logically assume that living under an artificial light

source that lacks these wavelengths can contribute to causing the ailment in the first place.”²⁵⁷

Ott’s conclusion makes sense, considering that humans evolved while becoming acclimated to all of the electromagnetic wavelengths emitted by the sun—each of which has specific properties. Acupuncturist Anna Cocilovo and physician Ron Rosen write:

Colored light has a particular ability to balance the autonomic nervous system, which is crucial in most chronic and functional disorders as it regulates all of the automatic processes of the human body: breathing, the beating of the heart, the functioning of the digestive tract, the stress response. Light as an environmental stimulant, is second only to food in its impact on controlling bodily functions. Interestingly, light through the eyes reaches not only to the visual centers of the brain, but also the hypothalamus. The hypothalamus is the brain’s brain. It . . . houses the body’s biological clock, . . . organizes information from our external and internal environments, initiates the stress response, regulates immune function, reproduction, thirst, hunger, temperature, emotions, and sleep patterns.²⁵⁸

Different colors produce different effects. For example, red light is stimulating. It increases muscular strength, eliciting 5.8% more electrical activity in the arm muscles compared to other colors. In contrast, pink light calms both the muscles and the nerves, inducing effects that are not only psychological but physical, too. Liberman reports that in inmates placed in small holding cells painted bubble-gum pink, “a reduction of muscle strength happened . . . within 2.7 seconds. [This particular shade of pink] has been proven to calm the most jangled nerves within minutes. Where brute force or sedative drugs were once the only treatment option, . . . pink holding cells are now used to significantly reduce the incidence of violent and aggressive behavior.”²⁵⁹ It’s reasonable to suppose that violent individuals, for whatever reason, might suffer from a deficit of that particular wavelength of electromagnetic radiation, which is visually perceived as pink light.

Blue light is so famous for its therapeutic effects that it has been used by the mainstream medical community for half a century to treat babies born with jaundice. The distinctive yellow skin color of jaundice—a condition found in over 60% of prematurely born infants—is caused by bilirubin. *Bilirubin* is a yellowish chemical from the liver that accumulates in the tissues when the body cannot break it down. Unless given blood transfusions, these babies have always been prone to brain damage and even

death. However, in 1956 a nurse named Sister Ward at Rochford General Hospital in England accidentally discovered, and then popularized, the use of light to heal this disorder. Not wanting to leave the babies in the stuffy incubators all day, she wheeled them into the sunlight for some fresh air. When new diapers were placed on the infants, the hospital staff noticed that the skin was bright yellow underneath the cloth, but the rest of the skin was a much paler yellow. It was subsequently learned that bilirubin levels dropped dramatically in test tube samples that were exposed to sunlight.

Apparently, as Ott later wrote, the blue colored electromagnetic wavelengths pass through the tissues of the body, interact with the bilirubin, and transform it into a harmless substance that the body can easily excrete. This has led to the routine practice of placing jaundiced infants beneath bright blue, 450-nanometer-wavelength lights. The blue lights are somewhat less efficient than pure sunlight, but they can be used indoors all year long. Liberman comments:

Some medical researchers think neonatal jaundice is caused by immaturity of the infants’ organs. For example, the liver may not be developed enough to remove toxins from the body. Others think the jaundice is artificially created by a lack of sunlight in modern, windowless nurseries. *Since the liver’s ability to detoxify the body differs under various lighting conditions*, it is questionable whether neonatal jaundice is truly caused by an immature liver or whether it is the direct result of a premature infant’s sensitivity to sunlight deprivation. [emphasis added]²⁶⁰

Ironically, the use of blue light for bilirubin babies in lieu of simple sunshine may be partly due to the modern appetite for more complicated and high-tech solutions! Still, the need for blue light illustrates the vital role of the visible EM band on our physical, mental and emotional health.

Now that we have learned how light is a nutrient, it’s easy to understand that the bright red, orange and yellow of a sunrise heralding the energy of a new day, and the blue, indigo and violet appearing at night as we prepare for sleep, are more than just pretty poetic metaphors. Visible colored light appears in nature at specific times for a reason. You might regard a color as a visible corollary of the particular wavelength’s *function*.

The most effective color therapy developed to date is Dinshah’s Spectro-Chrome system (next). This therapy is so beneficial, versatile, conveniently low-tech, and inexpensive, that I want to share it with you in depth.

Dinshah's Spectro-Chrome Color Therapy

Therapy with colored light has been used for centuries. Although our predecessors may not have known exactly *why* the therapy worked, they knew that it *did* work. In his 1878 book, *The Principles of Light and Color*, American physician Edwin Babbitt described his system of applying colored light to the body, and using sunlight to charge water in colored glass bottles from which his clients drank. The book also related many case studies of people who could not be helped by conventional medicine, but whose health was restored by color therapy. Babbitt explained that the warm colors (red, orange and yellow) were stimulating and arousing, and could therefore treat conditions of depletion such as paralysis and exhaustion. The cool colors (blues and violets) were soothing and sedating, and could therefore treat conditions of inflammation such as meningitis, sunstroke, and burns.

Color therapy became much more prominent after Dinshah P. Ghadiali (1873–1966), a man of Persian descent who was born in India, came to the United States as an adult. In many ways, Dinshah's genius and history paralleled those of Royal Rife. By age 11, Dinshah (as he would later be called) was assistant to the Professor of Mathematics and Science at Wilson College in Bombay, India. He spoke over 20 languages competently, gave demonstrations in physics and chemistry, became an electrical engineer and mechanical engineer by trade, and eventually earned MD and PhD degrees. In 1896 Dinshah visited the United States, where he lectured on X-rays and radioactivity and met (among other scientists) Nikola Tesla and Thomas Alva Edison. Because of his genius, *The New York Times* referred to him as “the Parsee Edison.”²⁶¹ In 1911, after Dinshah married, he came to live in the United States. At least five of his inventions were patented, including an automobile internal combustion engine fault finder, a color wave projector, and an electric thermometer.

Drawing from Babbitt's writings, his own experiences as a medical practitioner in India, and spectroscopic discoveries by numerous scientists, by 1920 Dinshah refined a sophisticated system of color therapy he called *Spectro-Chrome*. The therapy consisted of specially hued glass placed in the front of an enclosed box, behind which an incandescent bulb shone. The light was directed onto areas of bare skin that needed treatment. Different colored glass filters were used for different health issues. The colors spanned the entire rainbow: Spectro-Chrome was the first

color healing modality that utilized red, orange, yellow, yellow-green, green, turquoise, blue, indigo, violet, magenta, and scarlet wavelengths. Dinshah explained that when a person is deficient in a given color, illness relating to the deficiency develops—and by restoring that color to the person's energy field, the illness is eliminated. The website of the Dinshah Health Society states:

How can colored light possibly cause a physiologic effect inside a human (or animal) body? . . . Each individual cell in a living organism has a specific function to perform. In so doing, it generates and radiates a specific energy; the cellular energy totality is often termed the “aura.” The liver radiates the equivalent frequency (harmonic) of red light, the pituitary radiates green, the spleen violet, circulatory system is magenta, lymphatic system is yellow, and so on. The logic behind color therapy is this: when

**There are
two kinds of light:
the glow that illumines,
and the glare that obscures.**

—Plato
Greek philosopher,
mathematician, and writer
on the themes of love, knowledge,
rhetoric, and geometry
(about 428–348 BCE)

a particular organ or system is underactive, its auric energy decreases . . . [That's why] the appropriate activating color is projected on the affected area (sometimes the entire body). If overactivity is present, such as in excessive fever, the obvious remedy is an opposite (depressant) color. Further, by energizing the natural reparative powers present within us, rather than relying on drugs with their attendant often-dangerous side effects, resistant bacteria are not encouraged.²⁶²

Given that different forms of EM radiation affect us, it's natural that we would respond to visible light as well. (See Appendix C, “Healing with Electromedicine and Sound Therapies,” for more details.) However, unlike some wavelengths that have negative effects, *colors are nutrients*. This “food made of light” corresponds to *minerals*. By using spectrometry (which measures the various wavelengths emitted by elements), Dinshah could verify that certain minerals emitted the same wavelengths of light (colors) that were needed to treat different conditions.

Spectro-Chrome therapy was becoming more widely used by both medical professionals and the lay public when Morris Fishbein, head of the American Medical Association, initiated what would become years of legal proceedings against Dinshah. He attacked Dinshah with the same venom he'd directed against Royal Rife, Royal Lee, and other holistic pioneers. At one of Dinshah's trials, several distinguished medical doctors testified that they had successfully used Spectro-Chrome to treat cancers,

cardiovascular diseases, eye diseases (acute infections, cataracts, glaucoma and hemorrhaging), middle ear infection, diabetes, goiters, nervous system disorders (meningitis, polio and sciatica), gastrointestinal disorders (including hemorrhoids and ulcers), muscular and joint problems (arthritis, lumbago, rheumatism), reproductive conditions (such as gonorrhea and syphilis), respiratory diseases (including asthma, bronchitis, laryngitis, pleurisy, tonsillitis and tuberculosis), skin problems (boils and rashes), and an assortment of conditions one might not think color therapy could help (such as appendicitis, drug addiction and radiation burns). After being used for a strangulated hernia in one case, Spectro-Chrome eliminated the need for surgery.

One of Dinshah's most distinguished supporters was Kate W. Baldwin, MD, Senior Surgeon of the Woman's Hospital of Philadelphia. From the 1920s well into the 1940s, Dr. Baldwin used Spectro-Chrome in the hospital. One widely publicized case was of a severely burned child, whom the staff was unable to help and considered incurable (terminal). Baldwin achieved such spectacular success using Spectro-Chrome alone, that the hospital board later granted her request for more cubicles to administer the therapy. Baldwin wrote:

After nearly 37 years of active hospital and private practice in medicine and surgery, I can produce quicker and more accurate results with colors than with any or all other methods combined—

and with less strain on the patient. In many cases, the functions have been restored after the classical remedies have failed. Of course, surgery is necessary in some cases, but the results will be quicker and better if color is used before and after operation. Sprains, bruises and traumata of all sorts respond to color as to no other treatment. Septic conditions yield, regardless of the specific organism. Cardiac lesions, asthma, hay fever, pneumonia, inflammatory conditions of the eyes, corneal ulcers, glaucoma, and cataracts are relieved by the treatment.

In some unusual and extreme cases that had not responded to other treatment, normal functioning has been restored by color therapy. At present, therefore, I do not feel justified in refusing any case without a trial. Even in cases where death is inevitable, much comfort may be secured.

There is no question that light and color are important therapeutic media, and that their adoption will be of advantage to both the profession and the people. . . . There is practically no hospital that I know of, that is not using light, plain light or some colored lights, in some way; and there are [a] great many of our physicians, who are using color and light in their private work. . . . I would close my office tonight never to reopen, if I could not use Spectro-Chrome.²⁶³

The Best Light Source for Spectro-Chrome Color Therapy

For a light source that shines through the color gels, Dinshah specified that all wavelengths of visible light must be present. Otherwise, there appear what he called "irregular peaks"—decreased or missing wavelengths—which weaken the effects of the color transparencies. The best source is, of course, the sun. For indoor lighting, standard household incandescent bulbs (the type invented by Thomas Edison) are the best, whether 4 or 400 watts. Even though incandescent bulbs are weighted toward the red end of the spectrum, they're still similar enough to sunlight (with no emission gaps or peaks) to work well. Light shining through windows or skylights is fine if the glass allows all wavelengths through.

Fluorescent lights and so-called "full spectrum" neodymium bulbs are not recommended because according to spectroscopic analysis, they cause distortions in the resulting frequencies (colors). Compact fluorescent lights (CFLs) are inappropriate for the same reason. Also, CFLs are dangerous. In a CFL, a spark jumps from one electrode in a tube to another electrode, causing the gas inside the tube to light up. The spark generates lots of UV and too little visible light. To remedy this, the inside of the tube is coated with phosphor, which converts the UV emanations into the visible range. But the UV that escapes through tiny cracks in the phosphor coating damages skin cells. Also, the gas inside the tube is mercury, which is highly poisonous in even tiny amounts. What happens if the bulb breaks? Even if the bulb remains intact, it's not wise to use a bulb that may leak mercury. As for LEDs (dichroic reflector bulbs), the Dinshah Health Society recommends waiting until they're better made to emit all peaks of visible light.

In the United States, most incandescent bulbs are unfortunately no longer being made and it will soon be difficult to obtain them. However, some incandescent bulbs will still be available: rough- or vibration-service bulbs, appliance bulbs, some reflector bulbs, showcase (tubular) bulbs, and 3-way bulbs. The Dinshah Health Society also suggests a "specialty" bulb such as the Philips 25-watt halogen (which is equal to a 40-watt incandescent bulb). Lighting technology keeps evolving, so make sure that your source conforms to the Spectro-Chrome recommendations.

It's important to use the exact wavelengths (colors) that Dinshah used. His glass plates are no longer manufactured, but Darius Dinshah—one of Dinshah's sons who founded the Dinshah Health Society—recommends an acceptable substitute: transparent plastic sheets designed for theatrical lighting that emit the same color wavelengths as the old glass plates. A few lighting design companies in the US sell the "Dinshah colors," having been told by Darius what to offer. Darius's book, *Let There Be Light*, summarizes Spectro-Chrome's history and advises where to apply what color for hundreds of conditions, as well as where to obtain the color transparencies. (Spectro-Chrome contact information is in Appendix A.)

In addition to shining a light through the color filters onto bare skin, users can wrap the colors around clear glass water bottles to transfer the wavelengths into water, drunk promptly. Drinking the treated water can be more effective at the onset of a condition. And the effects of both drinking the water and applying the color externally are exponentially more powerful than the effects of either method used separately. Colored light can also be shone into a bathtub in a dark room—a good option to use if the condition requires color on both the front and back of the body. Water is easily imprinted, so the color is imparted to both sides of the body simultaneously.

In many cases, people achieve the best results when administering the therapy according to the "Variant Breath Forecast Time," based on the body's natural cyclic breathing rhythms. At different times of the day and night, more air passes through one nostril than the other, until a point is reached when both nostrils draw in the same amount of air. This cycle repeats and changes every several days. "The intent," advises Darius in a newsletter, "is to begin tonating [applying color] at a time when one nostril is at minimum pressure and continue until the nostrils are at an even pressure . . . about 44 minutes later. . . . There is another junction almost an hour and a half later as the gaining pressure nostril reaches maximum and reverses. When you cannot use a Forecast recommendation, try adding the 1½ hours to a Forecast time so you tonate through the reverse junction."²⁶⁴ The Dinshah Health Society computes the VBFT according to one's location, and for a modest membership fee, sends a year's worth to its subscribers. Finally, a new experimental way of tonating was recently suggested: during sleep, when the room is dark. It was hypothesized that simply taking in light through the head might be as effective.

Spectro-Chrome is non-invasive, inexpensive, and simple to administer. It's also low tech, as it doesn't necessarily require electricity (unless you use the therapy in the dark). During the day, all you have to do is go outside or be in a room that receives a little bit of sun.

Place the transparent color sheets on the bare skin, and the sun does all the work while you simply lie down or sit.

Not all artificial lighting will work for this therapy. You can use some types of electric bulbs but not others. See Sidebar on page 441, "The Best Light Source for Spectro-Chrome Color Therapy," for details.

Animals also benefit from this therapy. A Dinshah Health Society newsletter reported that about 1,400 day- and week-old ducklings in a pen had a yellow-green light shining on them. "It had to be turned off to prevent physical injury because they climbed over one another, even five deep, to get near the lemon color."²⁶⁵

My own success with Spectro-Chrome therapy has been profound. Over the course of two decades, I restored nerve function to a numb, burning and tingling knee, eliminated three cysts, helped speed the reduction of cataracts, and reduced swelling after dental surgery.

For about one hundred dollars, you can obtain all the materials you need to help yourself heal from a wide range of ailments. Spectro-Chrome is so simple and low-tech that many people don't want to try it. They think that if you don't plug it in and it's very inexpensive, it can't possibly work. But they're wrong! It's sophisticated in principle—and most important, it *does* work. Don't let the apparent simplicity of this method fool you.

Let There Be Light

The visible light wavelengths on the electromagnetic spectrum have profoundly beneficial effects on living organisms. The physiological, biochemical, and psychological effects cannot be separated.

"The research papers don't seem to address the fact that humans evolved under natural sunlight," Liberman reminds us. "Are we supposed to dismiss five million years of evolution because science doesn't understand the supreme wisdom of nature?"²⁶⁶ As Bernarr MacFadden wrote presciently, back in 1937:

For innumerable years the world has not required science to give it sunlight. . . . Life on the planet has survived because it received enough of these rays to maintain life and health. What is needed now from science is not so much help in the application of the rays as help in removing the conditions that prevent them from reaching us.²⁶⁷

People ignored the benefits of sunshine—even becoming afraid of it—during the late 1930s. This was the beginning of the widespread manufacture and use of pharmaceutical antibiotics. Coincidence? Hardly!

If you use the sun for therapeutic purposes, make sure you are properly nourished, inside and out.

HOMEOPATHY

A Brief History of Homeopathy

Homeopathy, a form of healing even more subtle than acupuncture, belongs to the quantum world of resonance therapy. Even though it usually requires the ingestion of animal, vegetable or mineral substances, homeopathy—as with light and color therapy—utilizes frequencies. Like both visible light and invisible wavelengths of the electromagnetic spectrum, homeopathy has profound effects on living organisms.

Homeopathy began in Germany in the 1790s because medical doctor Samuel Hahnemann couldn't wait to quit his boring, tedious job of translating German medical documents into English. A local outbreak of malaria soon granted him his wish: He stopped translating to search for a cure. Accounts describing his early research conflict somewhat, but we do know that he first experimented with chinchona bark. Already widely in use for two centuries as an anti-malaria treatment, chinchona bark contains quinine, which reduces fever, and has analgesic and anti-inflammatory properties. Hahnemann discovered that healthy volunteers (including himself) who took the bark developed symptoms that were virtually identical to those of malaria. Noting the similarities between the formula and the disease that the formula was used to treat, Hahnemann began his experiments that eventually developed into the art and science of homeopathy.

As Hahnemann further experimented with various substances, he decided to use lesser amounts because he didn't want his research subjects to become overwhelmed by the effects of—or suffer permanent injuries from—the high amounts of the ingredients he was using. This led to the systematic methodology of homeopathic dosing. He dropped a tiny bit of powdered herb into a bottle of plain water and shook it. Then he put a single drop from the first bottle into a second bottle of plain water and shook the new bottle. Then he put a single drop from the second bottle into a third bottle of plain water and shook *that* bottle. He repeated this cycle until only the energetic signature of the material, but no physical molecules, remained in the water.

To Hahnemann's great surprise, the strength of the fluid he created did not diminish. It became stronger! He concluded that the shaking of the containers, known as *succussing*, liberated the life force of the ingredients. (Water is an ideal medium for being imprinted. Its ability to “remember” what has been dissolved into it

was illustrated by Japanese author Masaru Emoto. His book, *The Memory of Water*, contains photos of water that has been frozen after being exposed to various words on pieces of paper. When frozen, water imprinted with words like “hate” and “sorrow” forms ugly asymmetrical splotches, whereas water imprinted with words like “love” and “thanks” forms lovely symmetrical crystals. Similarly, polluted water produces ugly asymmetrical splotches, whereas pure uncontaminated water forms lovely symmetrical crystals.) Hahnemann discovered that a homeopathic preparation worked even better to cure a

disease than the more molecularly gross substance from which it was derived.

Encouraged, the doctor experimented with a wide variety of ingredients, both commonplace and exotic. Just a few examples were the ink of a squid, mare's milk, the mineral calcium carbonate, chamomile flowers, and rattlesnake venom. Hahnemann fed *dilute* substances to healthy volunteers to see what reactions could be induced. A remedy's

effects were called *provings*. He carefully recorded the physical, emotional, mental and even spiritual responses of the volunteers—the proving of the remedy—and then he matched their symptom pictures to an existing illness. After intensive cataloguing, Hahnemann amassed a repertoire of safe, effective remedies. The right homeopathic cure always induced a symptom picture similar to the illness for which it was being taken. (One example is *Allium cepa*, or red onion. Someone with a head cold—with symptoms of sneezing, runny nose and tearing eyes—would take homeopathic red onion because it causes those very same reactions in a healthy person.) Hence, the word “homeopathy” for this modality: it comes from the Greek word *homoios*, which means “similar.” Hahnemann explained that the remedy restored one's vital force, according to the principle of “like cures like.”

The doctor's 1806 essay, *The Medicine of Experience*, presented some fundamental principles of homeopathy:

- ◆ The effects of a given remedy can be known only by experimenting on healthy volunteers and not sick people. Otherwise, the symptoms of the disease might be mistaken for the effects of the remedy.
- ◆ The choice of remedy is based on the similarity of its effects to the symptoms of a sick person, not on what the practitioner believes is the cause of the disease.
- ◆ Remedies are given in small amounts and low doses to prevent unwanted symptoms, which are known as “aggravations.”

Life depends on
signals exchanged
among molecules.

—Nikola Tesla
Croatian-American physicist,
electrical and mechanical
engineer, inventor,
and designer of AC current
(1856–1943)

- ◆ Remedies are given in single doses rather than in complex mixtures of different doses. Also, two different remedies are never administered at one time.
- ◆ Remedies should be repeated only if there is a recurrence of symptoms.

Hahnemann's first edition of what eventually became *Organon of Medicine* was published in 1810, and the final sixth edition was released in 1821. The doctor continued practicing medicine and teaching at universities for the rest of his life. He also published six volumes of the *Materia Medica*, quaintly written accounts of all the provings of remedies discovered through experiments with volunteers. Today there are many books based on the *Materia Medica*, updated and with modern language.

Potencies (Dosages)

Since Hahnemann's time, the potencies of all homeopathic remedies have been standardized and made in an equivalent way. A minute quantity of the liquid or pulverized powder is put into a closed container of water and shaken. This diluting and shaking, in subsequent containers, continues until the desired dose is reached. The higher the number of dilutions, the stronger the dose.

The potency scale in homeopathy uses Roman numerals. With a dose of 12C (diluting by many factors of 10), there are essentially no physical molecules present in the solution. I say "essentially" because a 12C dilution might be regarded as the equivalent of having one molecule of substance present in a sphere of water with a diameter about the distance between the Earth and the sun. While 12C may contain one molecule of the original substance (and is the highest potency to do so), the amount of physical material in the fluid is still minuscule, too small an amount to effect the same type of change that a gross, measurable quantity of the same ingredient would induce. Notably, if the water that carries the homeopathic remedy message is transferred later to a solid carrier such as milk sugar, the resonance or vibrational signature remains. (I will begin discussing resonance in the next column.)

Dilutions in the "X" range (1X, 2X, 6X and 12X) are acknowledged to contain some physical remnants of the original material; but the effects are gentle. "X" formulas generally contain beneficial ingredients that the person needs, such as minerals (in the form of cell salts, page 446) and glandular substances (often given to treat allergies).

Homeopathy is the safest and most reliable approach to ailments, and has withstood the assaults of established medical practice for over 100 years.

—Yehudi Menuhin
famous violinist and conductor
(1916–1999)

In many cases, the body is even more receptive to these mild dilutions than to the gross chemical formulas. In Hahnemann's paradigm, dilutions in the aforementioned "X" range or in the "C" range (6C, 9C, 12C and 30C) primarily address physical issues, although at 30C a remedy begins to catalyze some emotional and mental responses as well. Dilutions in the very high ranges, such as 200C, 1M, 5M, and higher (although it's rare to use a remedy higher than 5M), strongly affect one's emotional and mental states. Some countries don't use Roman numerals for "X" or "C" doses, but they are implied.

It can take years of training in the art of repertorizing to match the correct remedy to the person. This is especially true of the lesser known and little-used remedies.

How Homeopathy Works

The Classical Explanation

Homeopathy has two basic principles. First is the "law of similars," or notion that "like cures like." A substance that causes symptoms of illness in a healthy person will relieve those same symptoms in a sick person when given in minuscule amounts. Put another way, a remedy resonates to the oscillations that the subject is emitting in his or her unhealed state. The second principle, the "law of infinitesimals," states that the more a homeopathic solution is diluted, the more powerful it becomes.

Homeopathy clearly works; its success is not due to a so-called placebo effect. We know this because when various remedies are given to sick animals—or even sprayed on plants riddled with disease and insects—most of the time, the animals and plants become well. Nevertheless, the general public doesn't really understand how homeopathy works.

Some practitioners think they know why homeopathy works, but they have different reasons to explain its success. Therefore, I will briefly cover several theories. The first theory I'll share is more of a theory of "how" homeopathy works, rather than an explanation of "why." But knowing "how" can be helpful. And because the "how" is so often what many teachers and books present, I am including it. To expand this theory of "how," I add some of my own ideas from a more psychological standpoint. The last explanation is from the field of physics. To me, it offers compelling proof of the science behind homeopathy. The preceding theories are compatible with the physics, and they all complement each other nicely.

The Philosophy and Psychology of Homeopathy

It is said that homeopathic remedies activate one's "vital force." Contemporary homeopath Andrew Lockie uses the analogy of a trampoline to represent a healthy vital force: it contains the necessary bounce to throw off any and all stones that might be hurled onto it. But a trampoline that represents a weak and chaotic vital force cannot protect itself from an onslaught of stones. When stones are flung onto it, the trampoline sags even more because it lacks the energy to fling them off. A homeopathic remedy acts like a much heavier object than any of the stones. Bouncing this heavier object onto the trampoline provokes a sufficient enough recoil so that the stones are finally thrown off the trampoline. A well-chosen homeopathic remedy can be regarded as the stimuli that energizes the vital force in cases of acute or chronic illness.

My own (complementary) perspective is psychological, but it also incorporates physics. I believe that the key to the success of homeopathy—indeed, of all healing—is *resonance*. Love is literally a frequency of receptivity and acceptance; so when you love someone else, you are resonating with them. This principle is understood by highly effective psychotherapists and healers, who are taught to enter a state of receptivity. They may embody this state by matching their breathing with the breathing of the client; by (sometimes subtly) assuming a similar physical position with some part of their body; or by replicating one or more of a client's gestures. In psychological parlance, these body postures are called "mirroring." Parents in harmony with their young children do it naturally. A mother smiles when the baby smiles, frowns when the baby frowns. The child who is mirrored grows up feeling loved because she or he has been acknowledged—whether through being seen, heard, or felt. The physical manifestations of mirroring correspond to emotional and mental resonance; each reflects and supports the other. Emotional and mental resonance are literally expressed in the frequencies and waveforms that emanate from one's electromagnetic field, as seen with equipment ranging from electrocardiogram devices to polygraph (lie detection) instruments to Kirlian cameras.

Homeopathy is another form of mirroring—physically, psychologically, and emotionally. A homeopathic remedy that matches a person's oscillations can be regarded as "holding space" for the person to be the best of herself or himself. The remedy gives a clear reflection of what the system is doing and how it is "off." This, in essence, allows the body-mind-spirit to "tell" itself, "Oh, is that

what I'm doing? I don't want that; I want to do something else instead, to become whole." In other words, being given unconditional space elicits healing.

Psychologically, if being accepted (mirrored) equals the feeling of being loved, on a tangible level the immune response (vital force) is activated, enabling the body to activate its healing potential. For thousands of years, the ancients understood that because matter emits and receives frequencies, healing takes place on levels of resonance or energy. Today, we can scientifically validate not only the effects, but also the energies themselves (see Chapter 6 and Appendix C). Our thoughts matter. They carry power, intention, and resonance.

The Physics of Homeopathy

Thanks to quantum physics, we can actually measure healing. In *Biological Chemical, and Nuclear Warfare: Protecting Yourself and Your Loved Ones*, medical doctor Savely Yurkovsky quotes British physics professor Cyril W. Smith, who points out that "physics, and not chemistry,

is the science from which to seek explanations" of how homeopathy works.²⁶⁸ Yurkovsky concisely summarizes what has been done to measure homeopathy's effects.

There is another dimension to everything in Nature, including our environment and our bodies. This dimension energy is the deepest and the most fundamental of all. The various forms and

interactions of energy comprise the main subject of the science of physics, which according to the National Science Education Standards, has been established as the most fundamental in the hierarchy of all sciences. In practical terms, "most fundamental" means that the laws and theories of physics must apply to other sciences and disciplines including chemistry, biology and medicine. . . .

Quantum physicists have discovered that atoms are themselves composed of about 60 different subatomic, or elementary, particles. The process of homeopathic preparation is evidently capable of *transferring energy and information from the subatomic domains of the original crude substance onto homeopathic solutions* . . . *Modern technologies using spectra-analysis obtained with the Raman-laser, infrared absorbance and nuclear magnetic resonance (NMR), have all confirmed the difference in emission patterns between homeopathic remedies*

Health is a state of perfect subatomic communication and ill health is a state when communication breaks down. We become ill when our waves are out of sync.

—Lynne McTaggart
American journalist and writer,
and author of *The Field* (2008)
(born 1951)

*and a placebo. Furthermore, substances that were both diluted and succussed to 30X potency, according to full homeopathic method, exhibited a specific band pattern in their emission spectra that was absent when the substances were merely diluted but not succussed. . . . [emphasis added]*²⁶⁹

Put another way, a homeopathic remedy (or any other substance, for that matter) leaves an *electromagnetic imprint* in the water. Due to its crystalline structure, water holds the charge of a substance, much as a silicon computer chip holds the electronic impulse messages that make a computer perform its various functions. The pioneer scientist Fritz-Albert Popp surmised that high dilutions of a substance—which carry the same resonance or signal as the original, undiluted material—attract and absorb oscillations pertaining to the malfunction, thus allowing the body to return to normal.

“Signal” can be defined as the message that you intend to send. Most of the time, it’s easier for the body to respond to a single, pure signal than a message that contains as much “noise” as it does signal. A homeopathic remedy can be analogized as the pure signal, and a grosser chemical substance such as a drug can be regarded as containing a high level of “noise.”

Modern Homeopathy Modalities

Constitutional Homeopathy

With Hahnemann’s original method, *constitutional homeopathy*, the practitioner inventories everything about the person: emotional, physical and spiritual symptoms; likes and dislikes; lifestyle. Then the subject is matched to a remedy. Usually the subject begins with a low dose (perhaps 12C or 30C) and finishes with a high dose (perhaps 1M). Different symptoms and discomforts are addressed with each successive remedy. With this system, one must be very careful about what homeopaths call aggravations. An *aggravation* is the intensification of a symptom before that symptom disappears. Aggravations can occur if the subject takes too many doses too closely together, or takes a remedy at too high a dilution. This is one reason that people consult professional homeopaths.

It can be difficult to determine for oneself which constitutional remedy is needed, as people are often not objective about their own character and flaws. This is why even professional homeopaths often consult (or should

consult) other professionals. However, there are some remedies that are used for acute (sudden-onset) rather than chronic ailments; and these are safe for everyone and easy to use. *Arnica montana* is effective for aches, bruises, scratches, wounds, and sprains. *Chamomilla* is used for infants when they are teething. *Apis mellifica* (from honey bees) is for bee stings, *Rhus tox* (homeopathic poison ivy) is for a poison ivy outbreak, and so on. These short-term remedies are used at very low doses for specific conditions, and they’re discontinued when the symptoms subside.

Academic volumes, published for the serious student or practitioner, feature exhaustive lists of thousands of remedies, some of them exotic. There are also books for the non-practitioner on how to use common remedies for everyday acute problems. Dr. Samuel Hahnemann was the first, but not only, person to devise a system of homeopathy. Modern constitutional homeopaths follow Hahnemann’s classic method of a single remedy at a time, while nontraditional homeopaths may prescribe several remedies

concurrently (such as organ support).

Homeopathic may be regarded as the dilution and succussion process by which remedies are prepared; although for that function, some practitioners prefer the term *potentization* and still regard “homeopathy” as strictly exclusive to Hahnemann’s methodologies. Nevertheless, as many subtle energy preparations are placed into the category of homeopathy, let’s look at some of them.

Cell Salts

Cell salts, also called *biochemic tissue salts*, were discovered by German medical doctor Wilhelm Heinrich Schuessler (1821–1898). Initially a practicing homeopath, in 1858 Schuessler decided that treatment should involve the basic constituents of the body’s cells. He used 12 basic trace mineral salts. Some contemporary systems have added more mineral salts, although they are less commonly used.

Although homeopathically prepared, the dilutions are very low (from 1X to 12X). Therefore, because minuscule amounts of the substances remain in the preparations, the cell salts are not administered according to Hahnemann’s “like cures like” principle. Straddling the line between subtle and physical, cell salts are easily absorbed by the body as nutrients. Depending on which cell salt is ingested, the body uses it to repair bone, cartilage, ligaments, muscles, blood vessels, nerves, and other tissues.

Homeopathy cures a larger percentage of cases than any other form of treatment, and is beyond doubt safer and more economical.

—Mahatma Gandhi
Leader of Indian
independence movement
in British-ruled India,
and inspiration worldwide for
non-violent civil disobedience
(1869–1948)

Schuessler felt that it was much easier to use these cell salts than the remedies in Hahnemann's system, which not only required a broad knowledge of effects, but also meant delving into the most intricate details of a subject's life. Skilled practitioners today might use facial diagnosis to determine which salts are required. Laypersons can simply want to use a combination remedy of the 12 basic cell salts, ensuring that the body is receiving all the nutrients it may need on a cellular level.

Immaterial Substances (Imponderables)

A homeopathic remedy can be created from anything: animal, vegetable, mineral, or energy waves (gamma rays; radio waves; X-rays and other ionizing radiation; the sun; electromagnetic, electrical or magnetic fields; etc.). A remedy made of X-rays was first proved in 1897, two years after Röntgen discovered X-rays. As modern life becomes increasingly complex and we are exposed to more (and different kinds of) ray-based pollutants, we need the flexibility and imagination to create remedies out of whatever ails us. Hence, the class of homeopathic remedies called *imponderables* was created. Although not widely known, the remedies in this group are highly effective. Sensitive people who react negatively to EM radiation in general—or to specific frequencies from cell phones, computers, high voltage towers, microwaves, or televisions (to name just a few)—may find this group of remedies particularly helpful.

Bach Flower Essences

Born in 1886 in England, Edward Bach was an intuitive and compassionate surgeon. Although he had a thriving private practice and worked at a prestigious hospital, he was dissatisfied. He saw few genuine cures. And he did not like being told to concentrate on diseases, as he believed that illness was a manifestation of disharmony in both body and mind and he wanted to treat the whole person. So in 1930 at age 43, he quit his practice and roamed the British countryside in search of new ways of healing.

This new system, known as the Bach Flower Remedies, consisted of 38 different remedies. All except one (made from a rock, intended to treat exceptionally rigid subjects) were comprised of flowers, picked at the peak of their bloom and infused in bowls of spring water left in the sun for awhile. Bach observed that when emotional imbalances were addressed, physical ailments healed. He spent the rest of his life administering his own “discovered” remedies to clients, with excellent results. Often, he dispensed several remedies together in the same bottle.

Advanced Bach Flower Therapy, by medical doctor Götz Blome, is an excellent book on how to use these essences.

Other Plant and Gemstone Essences

Dr. Bach left such an impressive legacy that other healers followed his example, communing with plants in their own regions of the world. Plant essences have been developed in the US (Alaska and California), Australia, and elsewhere. There are even essences made from gemstones. They all address different kinds of emotional and physical disharmony, in language reflecting the mindset of those who discovered the remedies. The powerful Australian Bush Flower Essences may help produce the deepest and most positive changes in the shortest amount of time.

These essences work differently from Hahnemann's remedies and other remedies that were discovered, proved, and used in similar ways (constitutionally) after Hahnemann's death. Although aggravations do sometimes occur with flower and gem remedies, this phenomenon isn't very common. Many books and websites describe how to use flower and gem essences, which are taken worldwide, and with good to excellent results.

Isopathy (Isodes)

Iso is derived from the Greek word for “equal.” Developed in Germany in the 1830s, its motto might be “the same exact thing cures the thing.” Whereas Hahnemann searched for the substance that matched the *symptoms* of the subject, isopathy uses a homeopathically potentized form of the *exact noxious ingredient* that initially *caused* the symptoms. The ingredient could be a pathogen, chemical, poison, drug, allergen, or even an innocuous food or something ordinary like soap. The homeopathically prepared remedies that are administered to neutralize the ingredients initially encountered by the subject, are called *isodes* (and sometimes, incorrectly, *nosodes*). This excellent modality can be quickly and effectively used in cases of poisoning (see the next page).

Autoisopathy (Nosodes)

Some people merge the categories of autoisopathy and isopathy, calling them both “isopathy.” Autoisopathy uses the subject's own bodily fluids and occasionally tissues—saliva, urine, blood, pus from wounds, scabs, etc.—that contain the disease-causing agents and/or their toxic byproducts. The homeopathically potentized remedies created from these diseased tissues are commonly called *nosodes*. (Some practitioners use the term *isonosode* to designate material from a similar group, and the term *autonosode* to designate material from the actual subject.)

Whereas classical homeopathy deals with many symptoms and the required remedy could be anything at all, isopathy and autoisopathy are meant to directly manage the noxious agent that is causing the immediate

How To Make Your Own Homeopathic Remedies (Isopathy / Isodes and Autoisopathy / Nosodes)

When To Make Your Own Remedy. Instead of taking a commercial remedy, you make your own remedy when:

- ◆ A commercially made remedy is not available to you.
- ◆ You need emergency treatment, and require a situation-specific remedy immediately.
- ◆ Your situation is unique, and a homemade remedy may work better than another (commercially prepared) remedy.

Example #1: A woman is bathing her toddler and some soap drifts into the child's eyes. The eyes turn very red and begin tearing. The mother immediately scoops up some of the soap and makes it into a remedy, which she orally administers to the little girl every 5 minutes. The child's eyes become completely normal in about 20 minutes.

Example #2: A man visits a very polluted part of the world, close to where a nuclear reactor disaster has occurred. He develops a headache, sore throat, swollen glands, and a rash—some of the classic symptoms of radiation poisoning. He places a clean, uncovered jar outside, pours a little water into the jar, and leaves it outside overnight. From this water he makes the remedy, which he will be taking long term.

Example #3: You are very ill with the flu and are suffering intense respiratory distress. Coughing from deep in your lungs, you bring up mucus and spit into a clean bottle. You fill it with water and make a remedy. Every day or every other day as your condition markedly changes, you'll repeat this process until you're feeling well.

Making Remedies From Your Own Bodily Fluids. This includes saliva (the easiest and safest), urine, tears, and blood.

- ◆ *Obtain a sample of the substance.* **Saliva:** Spit saliva into a clean glass. **Urine:** Let the beginning flow of urine fall into the toilet first, then catch a small sample of urine in a clean cup. **Tears:** Let them fall into a clean cup. **Blood:** Prick your finger with a sterilized needle (sterilized with a flame, then cooled), and place a few drops into a cup.
- ◆ **Succussion #1.** Put a tiny amount of the substance into a 1-ounce dropper bottle. Add 20 drops of water to the bottle and its contents. Screw on the cap. Succuss (shake) the bottle firmly 20 times, banging the bottom of the bottle with the heel of your hand. **Potency: 1X**
- ◆ **Succussion #2.** Pour out all the water (and any solid contents) from the bottle. (One drop remains automatically.) Add 19 drops of water and succuss again 20 times. **Potency: 2X**
- ◆ **Succussion #3.** Pour out all the water in the bottle. (One drop remains automatically.) Add 19 drops of water and succuss again 20 times. **Potency: 3X**
- ◆ **Succussion #4.** Pour out all the water in the bottle. (One drop remains automatically.) Add 19 drops of water and succuss again 20 times. **Potency: 4X**
- ◆ *Fill the remainder of the bottle with water.* Take a dropperful once to twice daily for one week. Succuss before each dose.
- ◆ *Make a new batch each week, as your body's changes will require new and different energy.*

Making Remedies From Your Own Bodily Solids. This includes vomit and stool (and perhaps mucus). *Do not use this method unless you have an electronic remedy maker. This ensures that no toxic molecules will be in the solution.*

- ◆ *Obtain a small sample of the substance.* Be very careful when handling it because it's probably infectious. Use rubber or latex gloves if you can, and handle it with a clean tongue depressor or small wooden toothpick.
- ◆ *Follow the instructions of the remedy maker. Make a new batch each week, as your body's needs will change.*

Making Remedies From Exogenous (outside of the body) Substances. These are noxious substances to which you are accidentally exposed: spoiled or allergenic foods, radiation, pollen, chemicals, drugs.

- ◆ *Obtain a sample of the substance.*
 - a) If it's a solid material, you need just a small amount. Scoop it with a clean utensil (wood preferred). If it's obvious dust or mold particles, you can gather them with a utensil or a clean paper towel.
 - b) If it's pollen or plants, collect a representative sample and let them soak in water. Use this water as the allergenic solution from which you'll be making a remedy.
 - c) If it's airborne, hang a clean wet paper towel in the air and allow it to dry. Then tear off a small piece from the area that had been wet. This will contain the airborne substance you need—be it mold spores, radiation, or other contaminants in the air. Alternatively, you can simply place a small amount of clean water into a bottle and leave it open to the air. The remedy can be made from this solution.
- ◆ *Follow instructions Succussion #1—#4, middle of page. Make a new batch each week, as your needs will change.*

symptoms. Even though not all symptoms are necessarily addressed by a nosode, it can save someone's life in cases of sudden and severe infection.

Some people, intending to prevent a disease, use these homeopathically prepared discharges as one would use an allopathic vaccine. However, because these nosodes carry the energy of the disease, they are best used only *after* the individual has already contracted the pathogen and there's an outbreak. See Insert, "How To Make Your Own Homeopathic Remedies."

Combination Formulas

Most health food stores carry homeopathic preparations that contain a mixture of many different substances, all at low doses (mostly in the "X" range). Available as creams or tinctures, the most popular of these remedies address allergies, colds, the flu, and injuries. Most constitutional homeopaths (in the strict tradition of Hahnemann) don't approve of multiple-remedy formulas. Some analogize such low-dose preparations as "throwing it all on the wall and seeing what sticks." While there's some truth to this criticism, I have often utilized such preparations with good results—especially a popular cream that contains *Arnica montana*, *Ruta graveolens*, *Hypericum perforatum* and other substances that work well for injuries. People without access to (or funds to pay for) constitutional homeopaths find such formulas very helpful, especially for everyday conditions and emergencies.

Electronic Homeopathy

The growing market of electromedical devices includes equipment that creates homeopathic remedies using electricity, based on a substance's electromagnetic signature. The actual substance is placed on the "send" part of the machine, and a bottle of fluid or starch pellets is placed on the "receive" part to collect a homeopathic imprint of the ingredient. Some machines allow the user to program any potency, while other units can impart only a few potencies. These machines can make remedies from blood, urine, saliva or skin cells; from mold collected in the house; from stinging soap that has gotten into the baby's eyes; from radioactive elements in the air or soil; from the pollen of flowers growing in the neighborhood that's making you sneeze. The possibilities are endless. Some machines can also copy already existing remedies.

Sarcodes

Sarcodes are different from other homeopathic remedies. Based on the principle that each type of tissue has its own frequency, they're made from healthy living tissue. The frequencies reinforce targeted cells of the body to function properly, and are usually delivered via electronic means.

The Growing Popularity of Homeopathy

The list of famous and accomplished people who have used homeopathy, often as their primary medical care, is impressive. This includes eleven US Presidents (including Abraham Lincoln and Bill Clinton); two British Prime Ministers (Disraeli and Blair); seven Popes; many US writers including Ralph Waldo Emerson, Henry Wadsworth Longfellow, Louisa May Alcott and Nathaniel Hawthorne; and the European writers Goethe, Sir Arthur Conan Doyle, Lord Alfred Tennyson and George Bernard Shaw. Other notables include Charles Darwin (who asserted that he would not have been able to write *Origin of Species* without receiving homeopathic treatment); sports greats David Beckham and Martina Navratilova; musicians (ranging from Ludwig van Beethoven and Frederic Chopin to Dizzy Gillespie, Tina Turner and Paul McCartney); and film and TV personalities, just some of whom include Sarah Bernhardt, Marlene Dietrich, John Wayne, Suzanne Somers, Lindsay Wagner and Tobey Maguire. Most impressive are the leading physicians and scientists who spoke favorably about homeopathy: Sir William Osler (called the "father of modern medicine"), Emil Adolph von Behring, MD (called the "Father of Immunology"), Charles Frederick Menninger, MD (founder of the Menninger Clinic, which today specializes in treating psychiatric disorders), August Bier, MD (called the "father of spinal anesthesia"), C. Everett Koop, MD (former Surgeon General of the US), and Brian Josephson, PhD (Cambridge professor and Nobel Laureate).

The British royalty has been well known for not only using homeopathy, but also for publicly supporting it. The British became consistently involved in 1835, after one of Hahnemann's colleagues cured Queen Adelaide's heart condition that conventional medicine had been unsuccessful in treating. Today, Queen Elizabeth II is patron of the Royal London Homeopathic Hospital.

Homeopathy was initially accepted by the mainstream medical profession when it was first brought to the United States in 1825 by the few doctors who had learned it from Hahnemann. Although neither the medical community nor Hahnemann himself could explain exactly how it worked, they all agreed that certain natural substances, in a very diluted form, promoted healing. In fact, homeopathy worked well enough for them to prescribe it for their clients. By the mid-1800s, several medical schools in the United States were teaching homeopathy, and by the early 1900s, the number of colleges grew to twenty-two. At that time, only Western-trained medical doctors were allowed to practice homeopathy, and one out of five doctors chose to administer it. But by the late 1940s, the mechanical model of science made homeopathy unpopular.

A large number of reputable scientific studies have been conducted on homeopathy and published in scientific journals (which is rather surprising, given the allopathic medical monopoly). In 1991, the *British Medical Journal* published an analysis of 107 controlled clinical trials, *spanning 25 years*, on the safety and effectiveness of homeopathy.²⁷⁰ Impressively, the investigators concluded that about 80% of the trials were of high enough quality to demonstrate homeopathy's value. Unfortunately, many favorable articles that have been published in peer-reviewed journals are no longer available when major information retrieval systems are searched. In the arenas of chemistry, medicine and general science, the necessary keywords are simply not in the databases. One such keyword is "hormesis." *Hormesis* is the science of healing from tiny amounts of a substance which, in large amounts, would kill. This isn't as outrageous as it may sound. For instance, the immune soldiers, T-lymphocytes, become overwhelmed by high concentrations of *antigens* (invader toxins that stimulate the production of *antibodies*, or defense immune proteins). However, low amounts of the same antigens stimulate the T-lymphocyte defense mechanisms. This principle applies to allergens and the treatment of allergies. It can also apply to homeopathy.

As for conducting more studies—assuming that such research would even be published by the allopathically dominated medical journals—one problem is equipment. Studies involving the quantum realms require the use of very expensive, sophisticated machines; and equipment that can properly measure the remedies is not standard in most laboratories. Also, little or no money can be made from proving that homeopathy works. Therefore, most researchers don't feel a need (or have extra money) to conduct more studies. Considering the financial and political power of the medical-pharmaceutical cartel, it's understandable why homeopathy isn't utilized in every medical clinic worldwide. Not surprisingly, the FDA is now trying to regulate homeopathy like a drug (which means that its everyday, easy access is being threatened).

In societies that teach a mechanistic view of the universe, many people have difficulty perceiving that homeopathy is a valid healing modality—even when they are offered scientific proof. Not coincidentally, opponents of homeopathy often gravitate to (and cite) the few, poorly conducted studies that presumably prove homeopathy to be fraudulent. At this point in human history—especially considering advances in modern quantum physics, and the use of electromedicine worldwide—it seems futile, if not downright silly, to try to refute the energetic aspect of physical matter. Homeopathy can work for everyone. I use this exceptional vibrational medicine in my everyday life, and would not be without it.

DETOXIFICATION

It's a Dirty Job, But Someone Has To Do It

A naturopath once told me that she hated the term "detoxification." Surprised, I asked her why. The term, she replied, suggested that our bodies are dirty, an idea she found distasteful. The problem was, she was associating the accumulation of debris with moral failure. But there's no judgment here! The truth is, our bodies *are* dirty. Or rather, they *get* dirty. Waste removal in a living system is a fact of life. In fact, it's a sign that there *is* life. Removing debris from our system is like replacing the oil in our car or changing the spark plugs to ensure that the car burns fuel more efficiently and runs smoothly. We want our bodies to give us better mileage as well.

The terms "detoxification" and "cleansing" are often used interchangeably, though technically they're different. *Detoxification* is a deep biochemical process during which systemic poisons are transformed into less harmful wastes. The only organ that can perform this conversion is the liver; and it does this in four stages. (All four stages must be completed before toxic substances become completely benign.) The colon, kidneys, lungs, skin, and to a certain extent the lymph, are elimination channels. They help move wastes out of the body, but they themselves are not involved in metabolically transforming the poisons. *Cleansing* is the process of mechanically clearing or nutritionally supporting the elimination channels.

Because so many people use the two terms interchangeably, I will discuss detoxification and cleansing together. Many health practitioners, especially allopathic doctors, are ignorant of simple, effective protocols that not only can help you feel better, but may save your life.

The Pollutants That Surround Us

Functionally, each cell in the body is a microcosm of the larger organism to which it belongs. Cells "breathe" (cell respiration), ingest and metabolize nutrients, excrete wastes, and respond to stimuli—input, signals and instructions—that originate outside the cell and are transmitted through receptors in the cell membrane. These various forms of stimuli exist in the form of electrical, magnetic, and electromagnetic signals. On the physical level, their counterparts are chemical messengers.

There are two sources of pollutants in the body: toxins originating from or produced in the system itself (*endogenous*), and those introduced from outside the system (*exogenous*). Exogenous substances are most often acquired through ingestion, inhalation, or transdermally (through the skin).

The Health Hazards of Fabric Softener

Fabric softener is a dangerous chemical cocktail that's promoted as essential for laundry and suitable for everyday use. Sold all over the world, fabric softener is manufactured as a liquid, as a powder, or in chemical-impregnated fibrous material (popularly called "dryer sheets"). Although fabric softener is poisonous, many people use it in their homes several times a week—overburdening their liver's ability to neutralize the chemicals, and over time, making themselves and their families chronically ill, even terminally ill.

The chemicals in fabric softener are delivered in several ways. Tenaciously lodging in clothing fibers and outgassing into the air indefinitely, these chemicals enter the body through the skin of anyone who wears or touches the clothing. The chemicals also enter the bloodstream through the nose and lungs. As these chemicals pollute the air a good distance from their source, even those who don't use fabric softener are affected—whether they pass an area where laundry is being done or they're near someone who has it on their clothes. Ironically, consistent exposure for uninterrupted periods of time numbs the olfactory nerves, which are then unable to detect the presence of these chemicals.

Here's a brief summary of the ingredients in a typical fabric softener product—which manufacturers are not required to list on the product labels. The central nervous system (CNS) damage mentioned below includes aphasia (brain injury, causing the inability to produce or comprehend language), blurred vision, disorientation, dizziness, headaches, abnormal hunger, memory loss, numbness in the face, and pain in the neck and spine. Diseases associated with the central nervous system include Alzheimer's, Attention Deficit Disorder, dementia, Multiple Sclerosis, Parkinson's Disease, seizures, strokes, and Sudden Infant Death Syndrome (SIDS).

- ◆ *Alpha-Terpineol (A-Terpineol)*: Nerve damage. Ataxia (loss of muscle coordination). Severe mucous membrane irritation. Respiratory damage, lung inflammation, and fatal edema. Severe hypothermia.
- ◆ *Benzyl Acetate*: Known involvement in pancreatic cancer. Eye and respiratory passage irritation.
- ◆ *Benzyl Alcohol*: CNS damage. Gastrointestinal disturbances (nausea and vomiting). Respiratory tract irritation. Industry literature indicates that in severe cases, death results from respiratory failure.
- ◆ *Camphor (synthetic)*: Respiratory tract damage (coughing and wheezing). Eye and skin irritation. Headaches, mental confusion, seizures. Stomach pain and nausea. Kidneys and nervous system damage. High exposures can cause unconsciousness and death. On the Hazardous Substance List because it's regulated by OSHA (Occupational Safety and Health Administration). Note: the synthetic camphor used

in fabric softener, mothballs, and other commercial products is different from naturally-occurring camphor in some Chinese medicine formulas that's made by distilling the bark and wood of the camphor tree. Used correctly, *natural* camphor relieves pain, reduces itching, increases blood flow, eliminates fungal infections of the skin, and is sometimes inhaled to break up accumulated mucus.

- ◆ *Chloroform*: Central nervous system damage. Gastrointestinal disturbances (nausea and vomiting). Respiratory distress. Kidney and liver damage. Loss of consciousness. On the Environmental Protection Agency's Hazardous Waste list as carcinogenic. Industry literature (Material Safety Data Sheet) warns against breathing vapors, as inhalation can be fatal. The MSDS also advises to avoid exposing the substance to heat.
- ◆ *Ethanol*: Central nervous system damage. On the EPA's Hazardous Waste list.
- ◆ *Ethyl Acetate*: Eye and respiratory tract irritation. Narcotic (can cause stupor). Kidney and liver damage. Anemia. On the EPA's Hazardous Waste list.
- ◆ *Limonene*: Eye and skin irritation. Respiratory distress. Carcinogenic.
- ◆ *Linalool*: Central nervous system damage. Depressed heart activity. Respiratory distress, sometimes causing death.
- ◆ *Pentane*: Central nervous system damage. Eye irritation. Gastrointestinal disturbances (nausea and vomiting). Major respiratory damage. Skin rash (dermatitis). Industry literature (Material Safety Data Sheet) warns that inhaling the vapors may cause loss of consciousness.

Safe substitutes for conventional fabric softener exist, so there's no reason to ever use it. Some stores now sell unscented alternatives made with safe ingredients. You can also add ¼ cup of baking soda to the wash cycle, or add ¼ cup of white vinegar to the rinse cycle to eliminate static cling as well as soften fabric. (Don't use bleach at the same time; this may create toxic fumes.) Also to reduce static cling, allow your clothes to air-dry. Synthetic material, which causes most of the static cling, dries quickly when hung. The sun, as well as providing heat, always helps make clothing smell fresh.

It's hard to get fabric softener out of clothing. You will need to wash the clothes many times in soap and baking soda. Essential oils of citrus or lavender added to the wash water helps. You will need to hang the clothes in the sun for more than a month. While the clothes are hanging, spray them intermittently, many times, with 3% food grade hydrogen peroxide.

Fabric softener is not a necessity or a luxury. It's a poison!

First I will give you a quick look at the wastes produced by and inside the body. Then I'll briefly review some of the most common and poisonous chemicals, most of them deliberately produced by industry. These chemicals create an extraordinary burden on living systems by impairing vital functions. It should be against the law to create them—especially when perfectly serviceable substitutes, many of which work even better than their counterparts, can be found in the natural world.

Endogenous Biochemicals

You may recall the account of French doctor Alexis Carrel in the earlier section on **Water**. When he faithfully changed the mineral bath surrounding a piece of chicken heart, every day, the tissue remained alive, dying only when Carrel stopped changing the water. The tissue died because it was suffocating in its own waste. In live humans (and animals), the process is identical. If we fail to eliminate the accumulated load of poisons, we become ill.

There are many endogenous chemicals that can interfere with the body's function. Excess levels of stress hormones (such as corticosteroids), metabolic wastes that are too acidic or alkaline, and even normally beneficial biochemicals that the body cannot use and is unable to eliminate in a timely manner, all cause unfavorable changes in the terrain—and hence, every function of the body. Natural medicine emphasizes the regular elimination of toxins because it recognizes that accumulated waste breeds disease, much like piles of garbage attract flies.

In time, if endogenous chemicals are not eliminated, the person will become ill. Often, the body will create waste products in response to exogenous toxins, or those from external sources (see directly below).

Synthetic Chemicals and Heavy Metals

It's staggering to contemplate that "Humans Have Made, Found or Used Over 50 Million Unique Chemicals."

Humans have found or made 50 million different chemicals here on Earth, the vast majority over the last few decades. At least, that's how many unique chemicals are now registered in a database maintained by the American Chemical Society as of yesterday [September 9, 2009]. . . . "A novel substance is either isolated or synthesized every 2.6 seconds on the average during the past 12 months, day and night, seven days a week in the world," said Dr. Hideaki Chihara, PhD chemist and former president of Japan Association for International Chemical Information.

The rate [at which] new chemicals are being produced and isolated is astounding. It took

33 years to get the first 10 million chemicals registered and a mere nine months to get the last 10 million chemicals into the database. . . . While the Chemical Abstracts Service registry is the most comprehensive list around, there are undoubtedly more proprietary substances that remain off the books.²⁷¹

Of the chemicals that become new products (and leach into our environment and our bodies), less than half are approved by government agencies. These chemicals not only taint our air, water and soil, but they also contaminate the bloodstream, fatty tissue, and even breast milk of humans and animals. A 1995 study appearing in the *Proceedings of the American Public Health Association* stated that according to the United States Environmental Protection Agency, every person in the US had accumulated at least 30 different toxic chemicals in their tissues. Later studies increased that figure to 127. Then in 2005, researchers from the Environmental Working Group discovered an average of 200 industrial chemicals in umbilical cord blood of newborns.²⁷² Among the pollutants were pesticides, heavy metals (including mercury), perfluorochemicals (used as stain and oil repellants), flame retardants, and wastes from the burning of coal, gasoline and garbage.

A brief excerpt from my book, *The Holistic Handbook of Sauna Therapy*, describes the toxins in our environment.

[These chemicals] include pesticides, fertilizers, and volatile organic compounds (VOCs)—among which are formaldehyde, toluene, benzene, and styrene. These are found in antifreeze, carpet, disinfectant, laundry detergent, polishes and varnish, shampoo, even packaged foods. Heavy metals (also known as toxic metals) also find their way into the body—cadmium, lead, mercury and zinc in cleaners, cosmetics, paint, solvents, vaccines, and thousands of other items.

Detergents, heavy metals and solvents abound in cleaners, soaps and personal care products. Hydrocarbons and sulfur dioxide are in automobile, bus and airplane exhaust. Carpet contains acetone, benzene and ethylbenzene, formaldehyde, phthalate, styrene, toluene and xylene, in addition to heavy metals that give them their bright color. Clothing is treated with fire retardant and fabric softener. Computers, telephones, electronic devices, and thousands of other things outgas molecules of plastic. Deodorizers and mothballs are made from dangerous petrochemicals. Fertilizers also contain petrochemicals. Furniture, glue and adhesives contain solvents. Pesticides, insecticides,

fumigants, and fungicides, purposely made to be deadly, are registered poisons with the United States government. They are sprayed onto our crops and now are embedded in cooking utensils and children's toys. Shoe polish is comprised of dyes synthesized from coal tar, which in turn is derived from petroleum. Second hand cigarette smoke alone contains (among other chemicals) acetone, acetylene, ammonia, benzene, carbon monoxide, DDT, formaldehyde, heavy metals, hydrogen cyanide, methane, methyl alcohol, nickel compounds, nicotine, and propane.²⁷³

Fat cells have an affinity for trapping toxins, most of which are fat-soluble. This is actually a protective act, as the fat prevents poisons from circulating in the bloodstream and lodging in vital organs and glands. However, although an acceptable (temporary) strategy for waste storage, it's not a permanent solution. It's better to eliminate these poisons entirely. After I discuss radiation and microbial toxins, I'll provide a number of cleansing protocols for the major organs and glands of detoxification.

Radiation

In March of 2011, six nuclear reactors at the Fukushima Daiichi Nuclear Power Plant in Japan were severely damaged by a 9.0 magnitude earthquake and resulting tsunami, or tidal wave. Whenever a nuclear reactor leaks, deadly radiation is released. Carried by winds and rain and ocean currents, radioactive elements don't simply disappear; they last for a long time, usually centuries. The high levels of fallout from Fukushima were even greater than those from an earlier, widely publicized nuclear reactor disaster that had occurred in Chernobyl, Ukraine, in 1986. Soon after the Fukushima reactor damage, the jet streams of the Pacific Ocean were spreading the deadly particles to western United States and Canada. Animals began dying in the Pacific in record numbers. In 2013, Japanese doctor Shigeru Mita publicly stated that Tokyo was no longer fit to be inhabited. Not surprisingly, the entire planet is now contaminated.

One toxin that was released was a radioactive isotope of iodine—not normal iodine or potassium iodide, which are vital nutrients. Some sources estimate that as many as 750 rads of radioactive iodine contaminated the areas closest to the Fukushima reactors. A *rad* is a unit of absorbed dose of ionizing radiation. To give a comparison, one chest X-ray is about 3/100 rads, and one Computerized Tomography—also known as a CT or CAT scan, a three-dimensional X-ray used to find tumors and get detailed pictures of the body—is 1 rad. Radioactive iodine displaces healthful iodine from the body's receptor sites, thus destroying

thyroid function. Low thyroid function is now epidemic, largely due to huge amounts of airborne radioactive iodine.

Other types of harmful nuclear radiation included depleted uranium, cesium-137, cobalt-60, plutonium-238, plutonium-239, zinc-65 (a product of nuclear reactors, not the beneficial mineral zinc), and sulfur-35 (a product of nuclear reactors, not the beneficial mineral sulfur). Cesium-137 may be the most destructive radioactive product of all. With a 30-year half-life, it takes 30 years for half of its unstable atoms to decay and become benign. Cesium-137 contaminates the water and air. It remains in the soil for 200 to 300 years, rendering the land unusable for agriculture. This radioisotope can be ingested or inhaled, increasing the risk for cancer due to the high-energy gamma radiation and beta particles that it emits. Cesium-137 permeates soft tissues, especially muscles.

Symptoms of radiation poisoning (called “radiation sickness”) include weakness and dizziness; skin burn, blisters and itching; severe gastrointestinal pain, vomiting and diarrhea; septicemia (systemic inflammatory response caused by serious infection); extensive bleeding, both internally and from the nose; hair loss; nervous system damage (convulsions, delirium and seizures); respiratory failure; and eventually death, if the radiation levels are high enough. Cataracts in the eyes form more easily, and the incidence of cancer triples. All these conditions reflect genetic damage, death of bone marrow, and the failure of the body to produce white and red blood cells. The global mainstream media first minimized the seriousness and scope of the most widespread fallout that's ever occurred on the planet, and now media blackout is almost total.

I discuss radiation not to induce fear, but to help you give your body what it needs to cleanse and restore itself. Food is critical. Sugars, glutinous grains, and fake foods (trans fats, artificial sweeteners, preservatives, and other chemicals) offer no protection, and make the body sicker. The following foods, however, encourage cellular repair and offer some protection against radiation.

- ◆ *Animal Protein.* High levels of nucleotides (organic molecules that form DNA and RNA) are in sardines, anchovies, and liver from grass fed beef or free range chickens. Radioprotective Vitamin A is also in animal foods: beef, liver, poultry, raw dairy, and egg yolks.
- ◆ *Vegetables.* Cook Brassica family vegetables; their goitrogen compounds can lower thyroid function. Leafy greens (spinach, Swiss chard, lettuces) are rich in minerals (including magnesium, potassium, and calcium). The carotenoids in high beta-carotene veggies (carrots and other yellow vegetables, and dark leafy greens) are also radioprotective.

Protection from Radiation: General Guidelines

1. Iodine

The Entire Body Needs Iodine. The adrenals, breasts, digestive tract, eyes, kidneys, liver, lungs, pancreas, reproductive organs, salivary glands, sinuses, skin, thyroid gland, and white blood cells need iodine. There are two types of iodine—potassium iodide and unbound (or elemental) iodine. The thyroid gland typically uses potassium iodide, but most other parts of the body use iodine in its unbound state.

Among other functions, the thyroid gland regulates cell metabolism, energy, protein utilization, and temperature. To produce hormones, the gland needs the minerals selenium and zinc, and the amino acid tyrosine. During nuclear reactor malfunctions and nuclear fallout, radioactive iodine isotopes are released into the air. If the body's iodine supply is insufficient, radioactive isotopes latch onto the thyroid gland instead, causing severe illness and even death. Half of Earth's population is estimated to be deficient in iodine, so this is a good time to start iodine supplementation. Many doctors recommend taking both types of iodine to cover the needs of all the body tissues that use it.

Different Types of Iodine

- ◆ **Potassium Iodide (KI).** Iodine is in food and in supplements. As a synthetic chemical, potassium iodide is iodine bound to potassium. Naturally occurring in foods (such as sea vegetables and raw dairy), the iodine is bound both to potassium and to protein or peptides. KI from food is transported easily through the bloodstream and readily absorbed.
- ◆ **Unbound (also called Elemental, Colloidal, Atomic, and Nascent) Iodine.** Toxins typically have a positive charge, and atomic or elemental iodine has a negative charge, which allows it to bind to toxins. Manufacturers of elemental iodine assert that its molecular structure makes it absorbable by the entire body, including the thyroid gland.
- ◆ **Lugol's Solution (a combination of Potassium Iodide and Unbound Iodine).** Dr. David Brownstein and others routinely use a combination of KI and unbound iodine to treat underactive, overactive, and autoimmune thyroid disorders. Subjects are given selenium for several weeks before the iodine to eliminate a possible "thyroid storm"—rapid heartbeat, fever, and other effects from too much hormone suddenly secreted in response to the iodine.

Cautions. People who report negative effects from iodine, or an allergy to it, may be reacting to fillers or binders in the iodine preparation. Or, they may be responding to toxins that the iodine is causing the body to release. If enough iodine is ingested, it will displace fluoride, bromine and chlorine from the tissues and release them into the bloodstream. Toxins are picked up by bile. Ingesting activated charcoal will help scavenge the toxins in the bile.

How To Take. Conservative doctors suggest mcg amounts. Increasing numbers of holistic practitioners recommend 130 mg or more. Seek professional guidance; iodine is not just for times of radioactive fallout.

2. Baking Soda / Sodium Bicarbonate / Bicarbonate of Soda

Kidney Function. The kidneys are usually the first organs to show chemical damage from uranium exposure. Military manuals recommend sodium bicarbonate to help the body neutralize and excrete depleted uranium, and to alkalize the urine. Manufactured sodium bicarbonate (NaHCO_3) is related to a naturally occurring mineral in bile (produced by the liver). The bile duct excretes sodium bicarbonate into the small intestine to neutralize the acidity of the hydrochloric acid created in the stomach. Do not confuse baking soda with baking powder, which contains other ingredients, often aluminum! Use 100% pure baking soda.

How To Take (Internally).

- ◆ In 1925 the Arm and Hammer Company, manufacturer of NaHCO_3 , recommended for the flu: *Day 1*, take ½ teaspoon in a glass of water, at 2-hour intervals, six times a day. *Day 2*, take ½ teaspoon, at 2-hour intervals, four times a day. *Day 3*, take ½ teaspoon, morning and evening. *Subsequently*, take the same amount each morning until better.
- ◆ To help your body excrete radiation and other toxins, Dr. Marc Sircus suggests taking 1 teaspoon of sodium bicarbonate in a glass of water on an empty stomach, at least 1 hour before meals and 1 hour after meals.

How To Take (Externally). To pull out toxins and radiation from the body, lie in a hot water bath for 15 to 30 minutes with either the following combination formulas, or just a single ingredient if that's all you have:

- ◆ 1 cup of baking soda and 1 cup of salt.
- ◆ 1 cup of baking soda and 1 cup of magnesium chloride.
- ◆ 1 cup of baking soda, 1 cup of magnesium chloride and 1 cup of sodium bentonite clay. (Use a clay poultice too.)

3. Sea Vegetables (Seaweeds) and Sodium Alginate (extracted from brown algae *Laminaria japonica*)

Properties. Sea vegetables and algae build immune response, protect against radiation, and bind heavy metals. Seaweeds include arame, dulse, hijiki, irish moss, kelp, kombu, laver, nori, rockweed, sea lettuce, and wakame. The cleanest seaweeds are from the Atlantic Ocean. Note: Vitamin B12 inhibits the uptake of cobalt-60 (used in nuclear medicine), but the B12 in seaweeds is an *analogue* that latches onto the body's B12 receptor sites and prevents the real vitamin from being utilized. So, hours away from eating seaweed, take a methylcobalamin B12 supplement.

During the atomic bombing in World War II, Dr. Tatsuichiro Akizuki (Director of the Department of Internal Medicine at St. Francis's Hospital in Nagasaki) fed his staff and patients a strict diet of brown rice, miso soup, tamari, wakame and kombu and other sea vegetables, Hokkaido pumpkin, and sea salt. He also prohibited the consumption of sugar and sweets because they suppress immune function. No one developed radiation poisoning, whereas the occupants of hospitals located much further away from the blast suffered severe fatalities. At the Institute of Radiation Medicine in Minsk, Russia, children who ate 5 grams of spirulina a day for 45 days had enhanced immune response and lower radioactivity levels. Israeli scientists normalized the blood chemistry of Chernobyl children with *Dunaliella Salina* algae, which contains naturally high levels of beta-carotene.

The high mineral levels in seaweed help protect against exposure to radioactivity. Iodine helps prevent the uptake of iodine-131. Iron inhibits the absorption of plutonium-238 and plutonium-239. Zinc inhibits the uptake of zinc-65. And sulfur inhibits the uptake of sulfur-35 (a product of nuclear reactors). Sodium alginate is a polysaccharide found in seaweed, discovered in 1968 by Dr. Stanley Skoryna's research team at McGill University of Montreal. Usually extracted from brown algae (if used as a supplement), sodium alginate all by itself selectively pulls out of the tissues—and binds in the gut, to be escorted out of the body—radioactive particles of strontium, excess barium, cadmium, and (the harmful form of) zinc. The Russians isolated the polysaccharide U-Fucoidan from Vladivostok kelp, another radioactivity detoxifier.

How To Take. The minimum therapeutic milligram dosage of iodine is obtained by eating almost 1.6 ounces of dried seaweed. For maximum protection against radiation poisoning, the Atomic Energy Commission suggests at least 2–3 ounces of seaweed a week. *Don't rinse the seaweed before using it*—you want to retain all the minerals and other beneficial nutrients! Sea vegetables contain greater or lesser amounts of sodium alginate, but you can obtain this separately as a powder or in capsules. The Atomic Energy Commission suggests taking 10 grams (2 tablespoons) a day of sodium alginate. Or, take 3 capsules 3X a day, preferably on an empty stomach, twice a year for six weeks at a time.

4. Miso

Properties. Miso is a fermented paste made from soy, sometimes with barley or rice added. (Miso made solely from soybeans takes longer to ferment.) Specialty misos are made from aduki beans, chickpeas or other legumes. Unlike unfermented soy products, properly fermented miso is healthful. In 1972, Japanese researchers found that a component in miso called zybicolin successfully helped prevent radiation sickness. Zybicolin acts as a binding agent to detoxify and eliminate pollutants, and radioactive elements such as strontium, from the body.

How To Take. For one person, bring 1 cup of water to just under a boil, and pour it over 1 teaspoon of miso (or more, to taste). *Don't boil the miso.* High heat deactivates the enzymes; let the miso slowly dissolve in the water. You can add vegetables and beef for a delicious, nourishing meal. To order clean, live miso, go to southrivermiso.com.

5. Sulfur and MSM (Methylsulfonylmethane, a Sulfur Supplement)

Properties. Sulfur, a common mineral, is involved in myriad functions: the elimination of chronic inflammation and damage due to oxidation (which makes it so good for the joints); the improvement of cell membrane permeability (thus helping to escort needed substances into the cell); normalizing insulin function; and detoxification. The liver depends on sulfur-based enzymes to do its job. Without sulfur, glutathione—an antioxidant vital to the liver (and usually, but not always, produced by the body)—cannot work. Cysteine and N-Acetyl-Cysteine are precursors to sulfur-based amino acids (the building blocks of protein). Alpha-lipoic acid is an enzyme rich in sulfur. Nuclear workers exposed to radioactive sulfur need high levels of sulfur to displace and excrete the radioactive form.

How To Take. Sulfur is abundant mostly in animal proteins: meat, fish, pastured eggs, and raw dairy (milk, cheese and especially whey) from grass fed cows. Other foods rich in sulfur include garlic, onions, cruciferous vegetables (broccoli, kale, Swiss chard, collards, cauliflower, mustard greens, Brussels sprouts), and coconut and olive oils. Even with a sulfur-rich diet, you can still supplement with MSM, which is sulfur-based. Effective amounts range from about 1.5 gm to 6 gm. Cook cruciferous veggies because their raw compounds impair thyroid function.

6. Glutathione (*L-Glutathione, the most absorbable when taken orally*)

Properties. Radiation exposure not only triggers cancer by producing reactive free radicals that damage cells, it also depletes glutathione in the body. Glutathione helps neutralize free radicals, metals, and other toxins. White blood immune cells, the lungs, and especially the liver need glutathione. Cancer sufferers given radiation suffer from less cell damage, and overall fewer negative effects, when their glutathione levels are raised prior to exposure. (Note: Radiation given as cancer "therapy" is the same substance produced by nuclear reactor fallout; see Chapter 5, **Cancer**.)

Raw Materials Required for Glutathione Production. These help the body produce glutathione on its own:

- ◆ **L-Cysteine (or N-Acetyl-Cysteine).** Amino acid found in protein-rich animal foods, including whey that's *undenatured* (cold-processed) and colostrum from grass fed cows.
- ◆ **Methionine (or L-Methionine).** Amino acid, found in protein-rich animal foods, including undenatured whey.
- ◆ **Glutamine.** Amino acid in protein-rich animal foods including undenatured whey.
- ◆ **Melatonin.** Produced by the pineal gland, melatonin regulates immunity and helps raise glutathione levels. Tart cherries contain actual melatonin. Bananas, oranges, pineapples, oats, rice, barley, and tomatoes contain serotonin, an amino acid precursor to melatonin.
- ◆ **Lipoic Acid (or Alpha-Lipoic Acid).** An antioxidant itself, it also enhances the strength of other antioxidants by recycling them. Found in meats, especially organs like the heart, liver and kidneys, and in broccoli and spinach.
- ◆ **Sulfur.** Found most abundantly in meat, fish, eggs and raw grass fed dairy (see entry #5).
- ◆ **Silymarin or Milk Thistle.** Food for the liver, this herb help raises glutathione levels.

If the Body Cannot Make Glutathione. Stomach acid destroys most oral glutathione supplements, but *reduced* glutathione (GSH) works fairly well, as does liposomal encapsulation technology (LET) glutathione. You can also inhale glutathione through a medical nebulizer, which disperses fluids into the lungs in a fine mist. (Uranium oxide and other tiny insoluble radioactive particles are airborne and tend to lodge deep in the lungs.) The Lifewave company makes glutathione patches, which deliver the compound non-transdermally when adhered to the skin.

How To Take. All are available as nutritional supplements; follow label recommendations. See #7 below, last paragraph.

7. Other Antioxidants (*Vitamins, Enzymes, Herbs, Spices*)

Properties. Antioxidants neutralize toxins and heavy metals by preventing free radicals from damaging cells and DNA. Fake foods produce free radicals (atoms with too few electrons in the outer shell to maintain stability, so which therefore seize those missing electrons by stealing them from atoms in your body). Antioxidants are in organic foods (including raw fresh produce) and are also available as supplements. They include:

- ◆ **Carotenoids: Carotenes, Lutein, Cryptoxanthin, Lycopene and Zeaxanthin.** In bright orange and red fruits and vegetables, including sweet potatoes, carrots, tomatoes, pumpkin and apricots. Also in dark green vegetables including Romaine lettuce, spinach, and broccoli (the green chlorophyll in the veggies masks the yellow pigment of the carotenoids). Note: even though some people cannot convert carotenoids (precursors of Vitamin A) into Vitamin A, the carotenoids offer a protective function on their own, so they should be consumed.
- ◆ **Vitamin C.** In most fruits and vegetables, including bell peppers, dark green leafy vegetables, broccoli, Brussels sprouts, strawberries, pineapple, kiwi, citrus fruits, tomatoes, peas, cantaloupe, and cauliflower. If taken as a supplement, make sure it's not from corn, almost all of which is now genetically engineered.
- ◆ **Flavonoids, including Catechins, Resveratrol and Proanthocyanidins.** In most fruits and vegetables, as above.
- ◆ **Vitamin E.** In sunflower seeds, almonds, spinach, Swiss chard, avocado, shrimp, olive oil, peanuts, broccoli, asparagus, winter squash, pumpkin. Natural Vitamin E contains a family of compounds: four tocotrienols and four tocopherols. A natural supplement is labeled "d-alpha tocopherol." The artificial begins with a "dl-" prefix.
- ◆ **Superoxide Dismutase (SOD, an enzyme).** In green grasses (wheat, barley), cruciferous vegetables.
- ◆ **Coenzyme Q10** (more absorbable as the supplement *Ubiquinol*). Made by the body. In meat, poultry, fish, almonds.
- ◆ **Melatonin.** See above (#6).
- ◆ **Ginkgo Biloba.** Extract from the leaf of this ancient tree confers powerful protection. In supplement form only.
- ◆ **Turmeric.** Contains the compound curcumin. Taken in powder form and sometimes as a fresh root. Used in cooking.
- ◆ **Ginger.** Fresh root or powder mixed in water also benefits digestive tract (anti-nausea). Used in cooking.

How To Take. Antioxidants can be taken in almost unlimited quantities. Most people should take less than 3 gm of melatonin. If you use ozone, take antioxidant supplements 2 hours before and 6 hours after.

8. Green Tea

Properties. From the *Camellia sinensis* plant, the leaves are steamed to prevent them from degrading. (Black tea is oxidized, fermented green leaves.) Studies from Japan and China show that green tea has radioactivity antagonists with proven radioprotective effects, whether consumed before or after radiation exposure.

How To Take. Steep it for 3 minutes or less, or else the tea will be bitter. If you're sensitive to caffeine, avoid it in the late afternoon and evening (or entirely). Make sure your green tea is organic, because the plant concentrates any fluoride that naturally occurs in the soil and you don't want to ingest extra fluoride.

9. Essential Oils

Properties. Many oils have antioxidant, antimicrobial and DNA repair properties: rosemary, mint, tulsi, oregano, tea tree, eucalyptus, tulsi, frankincense, cinnamon, and more. Keep therapeutic or food grade oils on hand. Do more research on these and other essential oils to learn their individual properties.

How To Take. Dilute in almond, olive, coconut, or other carrier oil for external use or ingestion.

10. Zeolite Powder

Properties. Zeolites belong to a class of mineral clays known as *aluminosilicates*. The aluminum in them is inactive because the heavy metal is bound in the structure of the zeolite itself and is never released. Different types of zeolite have different molecular shapes, but all of them remove toxins through the process of *adsorption*, or the mechanical adhesion of two different materials. The honeycomb-like zeolite molecules act like a cage, capturing the atoms, ions (including free radicals), and molecules of dangerous materials. These materials include heavy metals (aluminum, arsenic, cadmium, lead, mercury and tin), pesticides, herbicides, and other contaminants. All adsorbed materials, as well as the zeolite, are eliminated from the body in under 8 hours. Note that after the Fukushima nuclear disaster, bags of zeolite were dropped into the seawater near the power plant to adsorb the radioactive cesium.

A combination of zeolites, sea minerals, dehydrated seaweed, spirulina, and chlorella can help eliminate the majority of cesium isotopes, including cesium-137. People suffering from cancer, who need to eliminate *Candida* and mold toxins, and who have infectious conditions, can all benefit from using zeolite. Clays are also helpful.

How To Take. For internal consumption, you need food grade zeolite. Finely powdered zeolite is better than coarse. Some people are selling zeolite liquid, claiming that it adsorbs more than the powder. This isn't true—you pay much more for less if you purchase the liquid, so buy the powder. Zeolite is sold in health food stores and on the Internet. Follow the directions on the bottle. Some people take several tablespoons a day, away from food.

11. Homeopathy

Remedies counteract ill effects of radiological tests such as X-rays and CT scans, so they might help with other radioactivity too. Take 1 to 3 hours prior to exposure, and another three doses after exposure, about 8 hours apart.

If exposed to radiation fallout: For all remedies, if a 30C potency is unavailable, use any potency, taking more frequent doses for lower potencies (4 to 6 times a day) and a less frequent dose (1 to 2 times a day) for higher potencies.

- ◆ **Phosphorus.** Often the first remedy needed after radiation exposure. To reduce pain and intensity of skin burns, and to lessen vomiting and other gastrointestinal upset. People who need Phosphorus are often thirsty for cold water, which is vomited when it becomes warm in the stomach.
- ◆ **Cadmium iodatum.** For "chemo" radiation, the kind that is delivered to people with cancer. Helps with nausea and vomiting, exhaustion, and feelings of being chilled.
- ◆ **Cadmium sulphuricum.** Also considered a primary remedy. For itching, vomiting, diarrhea, feelings of being chilled, hair loss, and severe flu-like aches and pains in the muscles. Do not use if you are taking Homeopathic X-ray (next).
- ◆ **Homeopathic X-ray.** For itching, gastrointestinal symptoms such as vomiting and diarrhea, feelings of being chilled, and severe flu-like aches and pains in the muscles. Do not take if taking Cadmium sulphuricum (above).
- ◆ **Radium bromatum.** For severe aching and arthritic pains made better from movement, as well as skin sores, ulcers, acne-like pustules, and sores that are slow to heal.
- ◆ **Strontium carbonicum.** For shock, hemorrhage, oozing of blood, faintness, constriction, and pain.
- ◆ **Combination remedy.** Contains many types of radiation. Different combination formulas made by various manufacturers are available from celleech.com and other sources.

IMPORTANT! There are many remedies for radiation poisoning, so please seek guidance from a homeopath who can help you find the right substance, potency, and frequency of dose that you need.

- ◆ *Algae Family.* Seaweeds, spirulina, and broken cell wall chlorella contain high nucleotide levels. The sea vegetables also contain high amounts of iodine. (As most algae contain a B12 analogue, eat red meat and take B12 supplements hours away from eating algae.)
- ◆ *Grass Fed, A2 Milk Products.* Whey protects the liver by providing some of the basic materials that the body uses to produce glutathione. Raw butter may help protect cell membranes. Some people can't tolerate (if they can even obtain) dairy, so monitor how you feel.

For more suggestions, see Insert, page 454, "Protection from Radiation: General Guidelines." This is an outline; see a qualified health professional for your unique needs.

Pathogens and Their Toxins

Pathogens and illness are inseparable in most people's minds. Pathogens do cause disease, but many of the symptoms we experience are from the waste they produce. This "waste" is none other than bacterial, fungal, parasitic, and viral excrement.

The more these pathogens proliferate, the more waste they produce; so it's important to eliminate them. Rife Therapy will help kill or disable the pathogens, but most of the time there will be a huge toxic overload for the body to excrete. This is why detoxification and elimination protocols are mandatory when rifeing.

Digestive Health

The Brain in the Gut

For the most part, we humans are self-contained. Our skin encloses and protects everything that's inside us—blood, bone, organs, glands, muscles, nerves—from external assaults. But the digestive tract is unusual. It's the only part of the body that is not sealed off from the environment. From top to bottom, from the open mouth to the rectum, the entire digestive apparatus is one long, meandering, variously-shaped pipeline that's open to the outside world.

Digestion is a combination of mechanical and chemical action on food. Food is pushed and squeezed along the digestive tract via peristalsis, a series of rhythmic, wavelike muscular contractions. After our food is chewed and mixed well with saliva, it enters the stomach, which mashes it into liquids and fine particles. Then the food reaches the small intestine, where the majority of the nutrients are whisked into the bloodstream through the villi, which are small hair-like projections in the intestinal lining. Some of the liquid passes through to the large intestine, but most of the remaining unusable material is insoluble fiber, pushed out the rectum as feces (stool).

Our digestive organs do a lot more than process food. In 1996, the chair of the department of anatomy and cell biology at New York City's Columbia University called the gut "the second brain," which is part of the enteric nervous system. Separate from the more familiar central nervous system, the *enteric nervous system* is located in the lining of the esophagus, stomach, small intestine, and colon. This lining contains receptors for the same neurochemicals that are usually associated with the brain and central nervous system. Anyone who has ever experienced nervousness or anxiety is familiar with the feeling of a fluttery stomach, known colloquially as having "butterflies in the stomach." The vagus nerve, the longest cranial nerve in the body and responsible for regulating many involuntary functions (including those in the heart), is also what causes the "butterflies." *Vagus* means "wandering" in Latin. And wander it does. Containing about 100 million neurons—more than the amount in either the spinal cord or the peripheral nervous system—the huge, long vagus nerve runs down the brain stem to the wall of the colon, where it's embedded and interfaces with the heart, esophagus, lungs, and digestive tract. About 90% of the fibers in the vagus nerve relay information from the gut to the brain (although not in the opposite direction). This little brain in the gut, with its mass of neural tissue, is largely responsible for our psychological state on a non-rational, emotional, reactive level. With an abundance of "gut feelings," it's easy to understand how difficult emotional states and stressful mental conditions can negatively affect digestion—and vice-versa.

Digestive Aids

After food is eaten, its transit time should be about 17 hours or less (if the meal was raw fruits and vegetables) or about 24 hours (if the meal contained animal products). But in many people, the peristaltic activity is uneven or sluggish, which causes the food to move too slowly.

There are many ways in which our digestive apparatus can malfunction. If the stomach does not produce enough hydrochloric acid, proteins are not completely digested and they leave the small intestine as unassimilated particles that circulate throughout the bloodstream. These particles may irritate joints and soft tissue (common symptoms of arthritis), or cause other symptoms that we may refer to as allergies. If the small intestine does not receive enough pancreatic juice from the pancreas to digest starches, the food sits there rotting, causing bloating and flatulence. If the colon is riddled with *Candida albicans*, ultimately long tendrils of the fungus will perforate the intestinal lining, allowing toxic waste material into the bloodstream. This condition is known as *leaky gut syndrome*.

Inviting Friendly Flora Home

You may think that you are the only consciousness inhabiting your body, but that's not true. You have (or should have) up to 500 different kinds of beneficial bacteria in your gut, one hundred trillion of them—ten times more bacteria than there are cells in the body. These friendly flora don't refer to the girl next door. They are part of the *microbiome* in the intestinal tract that colonize us in a mutually beneficial relationship. Unlike the harmful bacteria that we don't want, these flora are indispensable. They nibble on our meals (favoring inulin, a fiber in Jerusalem artichoke, and chicory), but they give much more than they receive.

In the large intestine, flora manufacture butyrate (a short-chain fatty acid that improves insulin sensitivity and increases energy), B12 (essential for the nerves, and not present in many foods), and Vitamin K (which helps clot blood and build strong bones). Friendly flora prevent toxins from being reabsorbed. They recycle bile. They boost the activity of immune cells and train them to recognize invaders. They produce anti-inflammatory compounds. And they do housecleaning. They stimulate the production of fluid (which helps move waste out of the body) and break down our unused food into fecal material (which we then excrete). Some flora even amplify the positive effects of other flora.

Incredibly, gut flora manipulate our behavior and mood! They do this through the various neural signals they send to the vagus nerve (which connects the gut and brain), and through the chemicals they produce (which make us feel good or bad). They alter our taste receptors so we eat what *they* want to eat. This helps determine our metabolism. Our health issues, ranging from diabetes to obesity to autism, depend to a large extent on which microbes inhabit our intestines.

Without the beneficial bacteria, we eventually suffer from some digestive disturbance—bloating, gas, heartburn, diarrhea, constipation, nausea, vomiting—or perhaps inflammation, which can lead to irritable bowel syndrome (IBS), Crohn's disease, and colitis. If you have these inflammatory conditions, or take antibiotics, the gut needs to be repopulated.

Just a sample of friendly flora includes *Lactobacillus acidophilus*, *bulgaricus*, *casei*, *reuteri*, *rhamnosus*, *plantarum*, *salivarius* and *sporogenes*; *Bifidobacterium bifidum*, *infantis* and *longum*; *Streptococcus faecium*; *Streptococcus thermophilus*; and *Lactococcus lactis*. The more and varied friendly flora that reside in our gut, the less room there is for unfriendly bacteria, such as *E. coli*, *Clostridium*, *Candida*, and *Proteus*. A few unfriendly flora are sometimes touted as beneficial. The pleomorphic bacterium *Lactobacillus licheniformis* (also called *Bacillus licheniformis* or *B. licheniformis*)

has been isolated from canine mammary tumors by a British researcher. Some scientists, including Rife researcher Jeff Sutherland, PhD, have shown that *Bacillus licheniformis* morphs into the cancer virus. Despite this, *B. licheniformis* can be found in some intestinal culture supplements and even a few dog foods. A representative of one popular company told me that while *Bacillus licheniformis* itself does not appear in the formula, it is used to produce the formula. To me, including even some of its residue doesn't seem wise.

Another potentially problematic bacterium in some probiotic formulas is *Enterococcus* (or *Streptococcus*) *faecalis*, linked in children to Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcus (also known as PANDAS). In immune-compromised persons, the bacterium—mistaken by the body for a more dangerous form of *Strep*—can trigger immune cells to attack the person's own brain tissue. This is why many PANDAS ailments range from obsessive-compulsive disorder to Tourette's syndrome. The potential of pathogen involvement in psychological issues is a good reason to use Rife Therapy.

Food sources of friendly flora are yogurt and kefir, and non-dairy vegetables such as sauerkraut, pickles, and kimchee (a spicy Korean sauerkraut with hot peppers). All of these vegetable foods must be naturally fermented and raw (unheated), so that the beneficial bacteria as well as enzymes remain intact.

What about probiotic supplements? Flora thrive in a pH between 6.5 and 6.9. The stomach at rest has a pH of 3.0, which can lower to 1.5 during a meal due to increased hydrochloric acid production (especially if the meal contains animal proteins). Therefore, according to colon therapist Victoria Bowmann, PhD, even orally ingested probiotics that are enterically coated to bypass the stomach acid will not be completely utilized by the body. If you want to take probiotics orally, do it on an empty stomach. If you want to repopulate the colon more quickly, Bowmann suggests *reflorastation*, or *infusion*, which is done on an empty bowel (optimally, after a plain water colonic or enema). Infusions can be administered with an enema bag, a bulb syringe, or even a dedicated turkey baster. Mix as many kinds of probiotics as possible into lukewarm water (preferably a bit acidic, between 6.5 and 6.9), squirt the fluid into the colon, and hold it for at least an hour. A good time for an infusion is just before bedtime.

Most people prefer taking probiotics in supplement form. However, no matter what way you choose to welcome friendly flora as your permanent guests, make your colon hospitable to them at all times. You need these flora as much as they need you—probably more.

Sugar is the food of choice for the yeasts and their more virulent fungal forms when the overpopulate the intestines. When the sugar-fed fungi proliferate, they overpower the friendly intestinal flora, and our ability to assimilate nutrients becomes impaired. A stressed digestive system leads to unbalanced gut ecology—and disproportionately high numbers of unwanted bacteria that cause disease. The gut bacteria should be at least 85% beneficial. (For more information, see Insert on page 459, “Inviting Friendly Flora Home.”)

Many of the so-called colon cleansing herbs actually target the stomach and small intestine, helping to improve digestion. Safe, effective herbs include peppermint, ginger root, and dandelion root. For people over 35 years old, who produce fewer digestive enzymes, it's prudent to take supplements to assist with digestion (discussed earlier in this chapter).

Colon Restoration

Sometimes, people are embarrassed about toilet functions. But the health of the colon is vital for overall health. The colon, which is the lowest portion of the digestive tract and the channel through which waste exits, is also known as the large intestine or bowel. The colon's sole purpose is to remove waste (generally insoluble fiber) that the body cannot use as nourishment. The bowel itself does not have the ability to render any materials harmless (which is the strict definition of “detoxification”). Most of the body's detox occurs in the liver, which sends toxin-filled bile into the colon, where it's then removed.

Waste from the colon is initially fluffy, but it loses water as it travels along. By the time the waste exits the descending colon, it's shaped. Stool should be uniform, thick like a hot dog and without kinks. Stool emerging in thin ribbons indicates restrictions, a compressed and

Herbs and Other Natural Substances to Eliminate Parasites

Parasites, worms, and amoebas steal your nutrients, unbalance the intestinal flora, and can cause cramping, bloating, constipation, diarrhea, excessive hunger, food cravings, blood sugar fluctuations, overweight or emaciation, skin rashes, itchy mucous membranes—and even mental fog, emotional volatility, and insomnia (due to their effects on the nervous system). Parasites are acquired through contact with an infected person or animal, contaminated water, or improperly washed or undercooked food. Even if parasites are eliminated, the tissues of the intestinal tract (and in some cases, organs) must also be rejuvenated and healed from the damage inflicted by the parasites.

The following herbs, spices, and foods have been successfully used in various anti-parasite formulas. No single ingredient deals with everything, so combination formulas are necessary. Various formulas are made from:

- ◆ **Black Walnut** (green hulls and sometimes the leaves). Kills adult parasites. Also is antifungal.
- ◆ **Clove** (bud). Dissolves some parasites and their eggs. Also is antibacterial, antiviral, and antifungal.
- ◆ **Diatomaceous Earth** (ground-up powder of fossilized, one-celled sea creatures called diatoms). Used in insect control, the minuscule, razor-sharp edges of the powder coats and pierces the exoskeleton of the insects and parasites it contacts. *Food grade* DE can be taken internally, although it's not safe to inhale for obvious reasons. It destroys both the adults and larvae in the intestinal tract. Ingested, it's safe for humans, pets, and livestock.
- ◆ **Fennel** (seed). Mildly laxative to humans and irritating to some parasites. Helps remove their wastes.
- ◆ **Garlic**. Better raw, but even cooked it can help. Is also antibacterial, antiviral, and antifungal. People with garlic in their bloodstream suffer from fewer mosquito bites. A raw garlic clove can be inserted into the rectum.
- ◆ **Male Fern** (root). Immobilizes parasites, preventing them and their eggs from adhering to the intestinal tract walls. Also works for outside the digestive tract. Very effective; mandatory in all good formulas but toxic in excess.
- ◆ **Mimosa pudica**. Ayurvedic herb from India reported to be thirty times more powerful than pharmaceuticals.
- ◆ **Sage** (leaves). Contains relatively high levels of thujone, the same ingredient in wormwood that kills parasites.
- ◆ **Senna**. A powerful laxative that should not be used long-term, senna is used in conjunction with other parasite-killing herbs because it promotes peristaltic action that helps expel the parasites. Senna also repels the worms.
- ◆ **Tansy**. Highly toxic to worms, it's used to both repel and expel parasites. In excessive amounts, it may cause spasms, convulsions, and hallucinations in humans.
- ◆ **Thyme**. Toxic to hookworms, roundworms, threadworms, and skin parasites (as well as some bacteria and fungi).
- ◆ **Wormwood**. The leaves and flowers are used. Kills roundworms, hookworms, whipworms, pinworms, and their larvae. Mandatory in all formulas. Also has strong antimicrobial properties.

contracted colon wall. The colon can be contracted due to emotional distress or not enough intestinal flora to help break down the debris. A true blockage prevents feces from exiting the body entirely, and requires immediate medical attention.

Many people mistakenly use the phrase “colon cleansing” when they are actually addressing (via herbs and other protocols) other areas of the digestive tract. The stomach breaks down food, and the small intestine funnels the nutrients into the bloodstream. Often, the part of the digestive tract that malfunctions the most is the colon. Its many pockets can become irritated, to which the body responds by producing mucus. The colon can also become distended. The breakdown of waste can produce even more poisons, which leak into the lymph and bloodstream. These toxins encourage parasites, protozoa, and worms to thrive in the mucous membranes that line the large and small intestines.

When too much fecal material is forced through a small opening, constipation develops. This overly narrow passageway can cause blood vessels lining the colon to break, a condition called *hemorrhoids* when it occurs at the anal opening. Constipation may also clog the ileocecal valve, the one-way shutter between the small intestine and colon designed to prevent waste from shifting from the colon back into the small intestine. Usually, when this clog occurs, the valve is stuck open (rather than shut). This poisoning can cause systemic toxicity.

A malfunctioning colon affects other systems. The lymphatic fluid is designed to pick up toxins from the colon and process them so the body can remove the waste. But excess mucus in the colon can overwhelm the lymph channels and impair the body’s immune function. This can occur anywhere in the digestive tract.

Foods. Mostly, it’s chemical-laden fake “foods” and refined grains that clog the digestive tract. Stripped of its fiber, the pure starch sticks to itself—and plugs up the colon wall. (This attribute of white flour has spawned an entire craft industry of sculptures made from white bread.) However, the bran and germ from whole grains can also cause many health problems (see **Food** earlier in this chapter). This is why the best fiber to keep matter moving is from high-cellulose vegetables, especially leafy greens and stalks like lettuces, kale, spinach, chard, and celery. Of the fruits, pectin-rich apples and especially berries help. Wild rice (which is actually the seed of a North American marsh plant) works very well. If your colon isn’t healed enough to accommodate raw fruits and vegetables, eat them cooked. Alternatively, juicing raw vegetables provides valuable nutrients and gives the digestive tract a rest from trying to manage all that fiber.

Herbs. Herbs are most often used to settle an upset stomach or induce the excretion of feces. Herbs used for the digestive tract are typically called *laxatives*, but there are distinctly different types. Actual laxatives (called *cathartic laxatives*, *stimulant laxatives*, *purgative laxatives* or simply *purgatives*) include *Cascara sagrada*, rhubarb, senna, castor oil, and the outer portion of the aloe vera leaf. They induce peristalsis by stimulating the colon nerve endings with irritating chemical compounds that force the bowels to evacuate. Although useful for emergencies, laxatives should not be used regularly because they can overstimulate and eventually damage the colon nerves, making it difficult for the colon to function on its own. These substances might also stress the liver.

Stool softeners (sometimes called *lubricating laxatives*) on the other hand—such as bentonite clay and powdered slippery elm bark—make the fecal material soft and slippery, allowing for easier evacuation. As they soothe and heal the inflamed mucous membranes that line the colon wall, they can be used as often as desired. The effects of *bulk-forming laxatives*, such as fibrous flax and psyllium seeds, aren’t as harsh as purgatives but are more rigorous than gentle stool softeners. The seeds absorb so much fluid that they swell to many times their size, thus pushing out other waste as they leave the intestines. They must be consumed with plenty of water to avoid the problem of constipation. In sensitive people, bulk-forming laxatives can cause gas and bloating, so they should be used with care.

Other herbs used for the colon include white oak bark (to tighten the colon wall), and fennel root and seeds (to relieve colic, gas, nausea, abdominal cramping, and accumulations of mucus). Ginger root, which very effectively eliminates gas and nausea, is safe enough to use during pregnancy. Plus, its flavor makes it wonderful to use in many types of cooking. For parasite control, see Sidebar, “Herbs and Other Natural Substances to Eliminate Parasites.”

Colonics and Enemas. To remove restrictions from the colon, normalize its shape, and help restore peristaltic motility, practitioners may recommend *colon irrigation* or *colon hydrotherapy*, usually simply called a *colonic*. A colonic is like an enema (discussed in a moment), except that it reaches higher into the colon. These practices are not new. Enemas were referenced in the 2000-year-old Dead Sea Scrolls—a collection of texts found inside Israeli caves, about a mile from the West Bank of the Dead Sea—and in a third-century Aramaic manuscript. In some areas of the United States colonics are illegal, so instead of seeing a colon therapist you may have to give yourself an enema.

To receive a colonic the subject lies on a table, wearing a loose gown open at the back. A trained professional, using special equipment, gently inserts, into the rectum, a tube attached to a water tank. When a valve is opened, water flows into the descending colon, across the transverse colon (horizontal at the navel), and through the ascending colon if possible. When the abdominal area gets too full or uncomfortable, the water leaves the tube, out through another attachment leading to a drain. The water in the colon—perhaps combined with other substances such as chlorophyll, wheatgrass juice, ozone or probiotics—mechanically dislodges waste. To help expedite the passing of waste, the colon therapist should massage not only the belly but also the outside of the thighs, which contain reflex points for the colon and thus stimulate peristaltic activity.

Many accounts of colon therapy that I have read mention the expulsion of long strings of mucus, unbelievable lengths of once-impacted fecal material, *Candida albicans*, parasites, and even whole worms, due to the mechanical loosening of the impacted junk off the wall of the colon. Keep in mind that not every colonic produces such dramatic visuals. However, even in the absence of such exotic materials, be assured that waste is being removed. The late medical researcher Dr. Norman Walker describes how his clients who received colonics eliminated colds, the flu, backache, asthma, poor eyesight and hearing, prostate trouble, allergies, thyroid deficiency and diabetes, as well as digestive disturbances.

Considering the prevalence of digestive disturbances—and that reflex points across the entire colon correspond to different body systems—it makes sense to take good care of your colon. If you can't find a qualified colon irrigation therapist, you can at least irrigate the lower bowel by giving yourself an enema. An enema bag and enema tube (which comes in various lengths and diameters) can be purchased at better drug stores and even online. Purified water is used for the enema. The colon's optimal pH is slightly acidic, between about 5.5 and 7.0 (which is neutral), so you can use slightly acidic water.

You can add the same ingredients to the enema water that colon therapists use in the colonics they administer. If you have an ozone unit, make fresh ozonated water for your enema. The ozone will kill harmful microorganisms while leaving the friendly flora alone. Ozone should not be combined with other ingredients because it may neutralize or interact with them in ways that you don't want.

It is inhumane, in my opinion, to force people who have a genuine medical need for coffee to wait in line behind people who apparently view it as some kind of recreational activity.

—Dave Barry,
humorist, author, journalist,
and Pulitzer Prize winner
(born 1947)

Many people use coffee for enemas. The first reported case may have been in the December 1866 issue of the *Pacific Medical and Surgical Journal*, in which Dr. M.A. Cachot described administering a coffee enema to successfully treat a child who was dying from an accidental poisoning. In 1896, Dr. W.J. Mayo (a founder of the famed Mayo Clinic) mentioned using coffee enemas routinely for people who had undergone abdominal surgery. Medical and nursing textbooks of the early 1900s advised coffee enemas as a treatment for shock. And in 1941, in the Uruguayan Medical, Surgical and Specialization Archives, Dr. Carlos Stajano described how people regarded as terminally ill—including one with cocaine poisoning and another with post-operative shock—immediately improved after being given coffee enemas. There's even an account that a coffee enema, administered to a soldier in pain, was used by a nurse during World War I. No painkillers were available, and coffee was the only liquid she had. The soldier was reported to experience deep, long-lasting relief. Somewhat later, German medical doctor Max Gerson (who had heard

about coffee enemas when serving on the front lines during World War I) began administering them to every cancer sufferer under his care. All of them had been dying, but became well after receiving the enemas. Gerson later founded clinics all over the world that utilized raw vegetable juices and other natural protocols along with coffee enemas. Significantly, in all of its editions between 1899 and 1977, the well-known medical textbook *Merck Manual of Diagnosis and Therapy* provided instructions on how to administer a coffee enema, after which this information no longer appeared. (Dr. Stanislaw Burzynski was reportedly told by a *Merck Manual* editor that the space was needed for other information.)

More contemporary practitioners who have routinely used coffee enemas include Austrian oncologist and surgeon Peter Lechner; Dr. Martin Heubner of Goettingen University, Germany; American dentist William Kelley, who saved thousands cancer sufferers; his student, the late medical doctor Nicholas Gonzalez, staff member of a cancer hospital in New York City until he concluded that holistic methods were better; and New York City-based Dr. Linda Isaacs, who used to be Dr. Gonzalez's partner.

How does a coffee enema work? Let's compare it to how the body detoxifies on its own. It's the job of the liver to transform contaminants into harmless substances. The problem is, it takes four stages for the liver to completely

neutralize most of these toxins, and different nutrients are involved in each of the four detox stages. During either Phase I, II or III, a metabolite could be produced that's even more dangerous than the original material. So, until the fourth stage is completed, poisons (albeit different ones) are recirculated through the bloodstream, during which time the person can become toxified all over again. A coffee enema, however, eliminates the need to wait until all of the metabolites are rendered harmless. The volatile oils travel through the capillaries of the rectum into the portal vein, a major blood vessel higher up in the colon—*directly to the liver itself*. The digestive tract is bypassed entirely (which is why the same results cannot be obtained by drinking the coffee).

The oils in coffee produce many beneficial changes. The caffeine stimulates the liver to make more bile. (Bile is made regularly by the liver and breaks down dietary fat.) Caffeine dilates the bile ducts and galvanizes the liver and the gallbladder (which houses the bile) to release stored toxins. The palmitic acids in the coffee stimulate the discharge of bile into the duodenum (the first section in the small intestine), where the toxins are discharged into the digestive tract and eventually excreted with the feces. Because the toxins don't recirculate through the bloodstream, they don't have to undergo any additional chemical changes by the liver, and their presence doesn't tax any of the other organs of elimination.

This is why an enema has very few detox effects such as headaches, runny nose, sore throat, or aches and pains. All of the poisons are instantly diverted to the lower digestive tract, where they're removed quickly and efficiently.

Other oils in the coffee have beneficial effects too. Theophylline and theobromine dilate blood vessels and counter inflammation of the gut. And the fat-soluble compounds kahweol and cafestol enhance the activity of glutathione S-transferases, some very important detoxification enzymes that neutralize a large variety of toxic compounds (including free radicals). The toxins are bound to the glutathione compounds by the bile, so instead of being released they're excreted.

Some practitioners report that their clients enjoy better moods and mental clarity as well, perhaps due to the reported ability of coffee (*only* when in the colon) to relax the fight-or-flight sympathetic nervous system.

To make a coffee enema, you'll need the following:

- ◆ *Enema bag or bucket.* The bag should have a hole to accommodate a hook, which you will hang.
- ◆ *Hoses.* The first hose attaches to the bag or bucket. The second, which attaches to the first, should be around 35 to 40 inches (about 89 to 102 cm) long, and under 3/8 of an inch (about 0.95 cm) in diameter.

Many people prefer a tube that's 1/4 inch (0.635 cm) in diameter. The tube should be soft, flexible, and thin enough so that it can be pushed fairly high up into the colon. It also should have a smooth, tapered tip, which makes insertion easier and more comfortable.

- ◆ *Clamp.* Attaches to a hose to prevent coffee flow.
- ◆ *Lubricant.* Water-based aloe vera, coconut oil, olive oil, or something similar for the hose.
- ◆ *Paper towels and trash basket.*
- ◆ *Coffee.* Use only up to 4 tablespoons of coffee per day, no matter how many enemas you do.
- ◆ *Clean filtered water.* Use between 1 and 2 quarts (or liters) of pure, filtered water for each enema.
- ◆ *Pot.* To boil the coffee, a glass or ceramic pot is preferable; but you can also use stainless steel. It should hold from 1 to 4 quarts (or liters), depending on the amount of coffee you use for your enema.
- ◆ *Strainer.* This should have a fine mesh, because you'll be using it to strain the coffee grounds from the water.
- ◆ *3% Food Grade Hydrogen Peroxide in Spray Bottle.* This cleans the hose and your hands after each insertion, as well as the tiled area when you're finished.
- ◆ *Molasses* (optional, but very helpful). If you find that you have difficulty holding the coffee in your colon for longer than 4 or 5 minutes, add 2 tablespoons of molasses to the strained hot coffee. The molasses is harmless and won't be absorbed into the bloodstream.

It's easy to prepare an enema. Put the coffee and water into a large glass, enamel or stainless steel pot. After the water starts to boil, lower the heat and let it simmer for about 15 minutes. Strain the grounds. Let the coffee cool enough so that the liquid is comfortably warm, but not hot, by the time you do the enema. Pour the coffee into the enema bag.

The enema is best done in the bathtub so you can lie down. Hook the enema bag onto the showerhead or shower curtain rod; the bag needs to be higher than your head so the solution can flow down the hose. Open the clamp and let the coffee run out a little bit to get air out of the hose; then clamp the hose shut. Lubricate a few inches of the hose that you'll insert into the rectum (once it slides in, the rest of the hose will follow). Lie on your *left* side in a fetal position (right leg on top of the left), the easiest position for tube insertion. Insert the lubricated tube as high in the colon as it will go (don't force it). Open the clamp, let your colon fill until you're comfortable,

and shut the clamp. If you decide to remove the hose immediately (optional), you can spray it with hydrogen peroxide and wipe it with a paper towel. Lie on your back and massage your abdomen to help break up deposits; and then turn on your right side. Retain the liquid for 15 minutes if possible. When you need to evacuate, sit on the toilet. You may need to remain there for awhile to expel all the fluid and the waste that has been lining the colon walls. Repeat several times until the coffee is gone.

Many people cannot hold coffee in their colon for even five minutes. Two tablespoons of molasses put into the very hot fluid after the coffee grounds have been strained will help with retention. Hot coffee will dissolve the molasses better (stir well), but let the fluid cool to a comfortable temperature before inserting the hose.

The coffee you use should be organic—you don't want to deliver pesticides straight to the organ that's trying to detoxify from those very compounds! The caffeine is mandatory; don't buy decaffeinated. And use regular, not instant. Any coffee can harbor mold, so make sure that what you're using is clean. Coffee enema proponents differ as to whether the coffee beans should be heavily roasted (dark) or unroasted (green). Those who prefer roasted may want to purchase Scott Wilson's organic gold roast coffee, as it has been processed to produce very high levels of caffeine and palmitic acid (which you want for an enema). Wilson supplies coffee to some well-known holistic clinics. You can purchase it online at sawilsons.com.

Colonic irrigations—or even milder, self-administered enemas—are not suggested for people with inflammatory conditions of the colon, which may manifest as copious rectal bleeding, fissures, polyps or severe hemorrhoids; perforations in the colon; or a prolapsed rectum. Also, don't do a coffee enema if you have eaten a large meal within the last two hours; if you have a coffee allergy; if you have pain, even when lying on the right side; or if you have pain in the lower right quadrant of your abdomen (this can indicate appendicitis). For other individuals, colonics and enemas are not recommended because of a possible emotional component. Not everyone is comfortable having a tube placed high into the rectum, or the feeling of water flooding the colon. They might perceive this as invasive, especially if there is a history of forced enemas, physical beatings, or sexual abuse.

Practitioners differ as to whether coffee enemas have any ill effects when done over a long period of time—say, two a day, every day, for a year or more. Those who are used to working with coffee enemas say that there are no disadvantages whatsoever, and emphasize their safety and effectiveness: for example, Lawrence Wilson, a medical and nutritional consultant in Arizona, US,

flatly states that coffee enemas do not deplete the body of either electrolytes or beneficial intestinal flora. Other practitioners, taking a more moderate approach, recognize the benefits but still suggest doing coffee enemas only for as long as absolutely necessary. Still other practitioners, wary of doing coffee enemas at all, make unsubstantiated negative claims. I think that coffee enemas can be helpful as long as you don't become too jittery. If this occurs, use less coffee. Some people who react negatively to coffee if drinking it can do coffee enemas if the solution is very dilute. Everybody reacts differently, so pay attention to how you feel.

Liver and Gallbladder Detoxification

Liver/Gallbladder Function and Physiology

The liver is the largest detoxification organ in the body—and the only organ, besides the skin, that can regenerate if a portion is missing. Among other functions, the liver breaks down toxic compounds into harmless ones. It does this in four stages. However, during the first detox phase the liver may create *metabolites*, substances that are even more toxic than the original compounds. Therefore, all four phases of chemical transmutation must be successful (otherwise, the liver is blocked). For all four phases to be successful, the liver must receive a wide range of vitamins, minerals, amino acids, and other nutrients.

Another major job of the liver is to secrete bile, a greenish fluid that emulsifies fats and encourages peristalsis. The liver can produce only a small amount of bile at a time, so all the bile it makes is stored in the gallbladder until the bile is needed. Fats in the digestive tract signal the gallbladder to release the bile that it's holding.

When the liver is blocked or sluggish, its detoxification job suffers. Blockage may also mean that bile flow is greatly reduced (which may cause constipation and the inability to digest fats). One of the most common causes of blockage in both the liver and gallbladder is stones, also known as gallstones. Stones that obstruct the liver, gallbladder, and bile ducts substantially interfere with one's quality of life. These stones can become such a major problem that if they are not softened and pushed out of the body, they might have to be surgically removed. The way gallstones are often removed is to have the gallbladder removed! But this doesn't stop the stones from forming; the person is merely eliminating one of the containers that houses the stones. The liver-gallbladder cleanse on the facing page is a safe, effective way to eliminate stones.

Less common problems with the liver include major infections (such as hepatitis) and degeneration, which is usually due to poisoning from chemicals and alcohol.

Liver–Gallbladder Cleanse

Introduction

Physiology. The liver contains many biliary tubules that deliver bile to the gallbladder through the bile duct. The attached gallbladder stores bile because the liver cannot make large amounts at one time. Fats trigger the gallbladder to empty bile into the small and large intestines. In many adults and even children, the biliary tubules are loaded with gallstones that cannot be seen on gallbladder X-rays because most stones are too small and don't contain calcium (visible to X-rays). Also, the worst stones tend to be in the liver. As stones multiply and enlarge, four problems occur: The pressure on the liver prevents it from producing enough bile and the bile duct becomes more blocked. The liver cannot detoxify poisons such as solvents and parasites. Cholesterol levels may rise due to impaired liver function. And the porous gallstones can pick up bacteria, viruses and parasites that pass through the liver, which causes infection.

The Stones. There are many types of gallstones, most of which contain cholesterol crystals. The crystals can be black, red, white, tan, or bile-coated green. The late Dr. Hulda Clark observed many stones imbedded with what might be the remains of flukes. Other scientists have found clumps of bacteria at the center of each stone—suggesting that the body forms stones for protection, similar to how an oyster creates a pearl around an irritating grain of sand.

Some wonder if the residue from these cleanses is food rather than stones. Clark pointed out that food residue sinks, but gallstones float because they contain cholesterol. The concentric circles and crystals of the eliminated cholesterol exactly match textbook pictures of gallstones. Some soft, waxy, floating cholesterol crystals do not form into round stones, but they *would* eventually harden if allowed to sit in the liver and bile duct.

Effectiveness of This Cleanse. Establishment medicine claims that gallstones are rare; that they aren't linked to allergies, digestive upset or impaired liver function; and that removing the gallbladder eliminates the problem. These beliefs conflict with how the body actually works. Dr. Clark observed that even with the gallbladder removed, people eliminate green, bile-covered stones with this cleanse. This cleanse painlessly removes most stones, gravel, crystals and other debris from the liver, gallbladder and bile ducts, which helps the liver more efficiently purify the blood.

Each liver cleanse is sometimes observed to “cure” a different set of allergies, suggesting that the liver could be compartmentalized, with different duties allocated to different parts. This cleanse alleviates pain in the upper back, shoulders, and upper arms. It also tonifies the intestines. The colon may be sluggish due to inadequate bile secretion. If stones are blocking the bile ducts, there won't be sufficient bile; so eliminating stones could help restore colon function. Many practitioners observe improved digestion in people who do this cleanse. Also, after a series of cleanses, it's not uncommon for people originally scheduled for gallbladder surgery to not need it!

People who do this cleanse every month report passing fewer and fewer stones with each successive cleanse. Dr. Clark stated that a person may have to pass up to 2000 stones over a year-long period before the liver is clean enough to eliminate allergies and body pain. Symptoms, which may diminish or disappear, might return as stones from the rear of the liver travel forward. However, the reappearance of symptoms is temporary.

Preliminary Preparation (optional). (a) Before you do this liver-gallbladder protocol, consider an herbal kidney cleanse. The kidneys filter substances that don't belong in the bloodstream or aren't needed. (b) For two days prior to the cleanse, and/or on Day 1 of the cleanse at 3:00 p.m., you may give yourself coffee enemas (see Chapter 3) to clean the colon and stimulate liver function. (c) Some sources suggest drinking one quart a day of unfiltered apple juice for three days before the cleanse, because the malic acid in apples helps soften and flatten the stones that will be released. I think this is a very bad idea, because apples are abundant in fructose—the very sugar that the liver has problems handling (see Chapter 3)! It's wiser to take malic acid capsule supplements.

Cleanse Days. Choose 36 consecutive hours when you have access to a toilet and can rest. Don't take nutritional supplements not specified here, or medications (unless your doctor tells you to). Otherwise, success could be hindered. On Day #1, don't eat fat. Eat fruit, vegetables, non-glutinous grains, protein powders, or (in the early morning only) steamed chicken or white fish. This allows bile to accumulate and build pressure in the liver, which pushes out stones.

If Problems Develop. Most people find this cleanse to be safe. However, if you feel pain from your torso to your throat, there might be a gallstone stuck in a bile duct. (Dr. Clark said that the appearance of clay-colored stool also indicates bile duct blockage.) To relax the spasms of the bile duct, take a heaping tablespoon of Epsom salts in $\frac{3}{4}$ cup of water on an empty stomach. The bile duct should relax within 20 minutes. If it does not relax and you still feel symptoms, immediately consult a holistic professional familiar with liver cleanses. Spasms may indicate the presence of parasites.

This cleanse is best done once every four weeks. The time between cleanses allows the existing stones to move forward in the liver, which enables them to be expelled during the next cleanse. You'll know you are finished when no more stones pass. If you are ill, weak, pregnant, nursing, or elderly, please seek holistic medical supervision!

Ingredients

- ◆ 4 TBS Epsom salts (magnesium sulfate). The label will say for both internal and external use. The magnesium opens the bile ducts, which allows the stones to pass easily. This ingredient is critical to your success!
- ◆ 24 ounces (3 cups) of filtered water.
- ◆ ½ (or ⅓) cup olive oil (light or non-virgin oil, which is easier to swallow).
- ◆ ½ (or ⅓) cup citrus juice, made from *fresh* grapefruit (preferably pink or red), fresh lemons, or a combination of both. Do not use concentrate or store-bought juice; this won't blend well with the oil you'll be drinking.
- ◆ *Optional:* (a) Ornithine (an amino acid), to help you sleep—4 capsules if you normally don't have problems sleeping, and 8 capsules if you do. (b) Starting three days before the flush, take 600 mg of malic acid 3 times a day for every 100 pounds of body weight. (c) 1 TBS of Vitamin C powder to nullify the taste of Epsom salts.

Equipment

- ◆ One 1-quart jar with a plastic (non-metal) lid for the Epsom salts mixture.
- ◆ One pint jar with a plastic (non-metal) lid for the citrus juice-olive oil mixture.
- ◆ A citrus juicer. This is mandatory, because you'll need fresh squeezed citrus juice.

Procedure – Day 1

You will need to eat foods that digest relatively quickly so your stomach can empty by evening. If you're able to fast on liquids, you may drink the fresh squeezed juice of 12 grapefruits until 5:00 p.m. If you're eating solid food, finish eating by noon (but you can drink a small amount of grapefruit juice until 5:00 p.m.). Choose light starches with no added fat, such as cooked oatmeal or baked potato (no milk, butter or sour cream), steamed vegetables, and/or green salads. Avoiding fats allows the fat-digesting bile to build up in the liver and gallbladder. If you are carbohydrate intolerant, eat low-carb, no-fat rice or pea protein powder in water. Some people manage with steamed codfish or flounder (without skin) or steamed chicken breast (white meat only, no skin) for the morning meal.

12:00 PM: Stop eating solid food, or you may feel uncomfortable later and the cleanse won't work as well. Mix 4 TBS of Epsom salts and (optional) 1 TBS of Vitamin C powder in 3 cups of cold water in the 1-quart jar. If you don't use Vitamin C powder, you may add a very small amount of citrus juice to the Epsom salt mixture just before drinking it.

6:00 PM: Drink ¾ cup of the Epsom salts. This may cause diarrhea. Don't be alarmed; Epsom salts have a laxative effect.

8:00 PM: Drink ¾ cup of the Epsom salts. If you didn't have diarrhea earlier, you may experience it now.

The timing of the main portion of the cleanse is relatively critical in achieving success. Try not to be more than 10 minutes early or late for anything that follows next. Be ready to go to bed immediately after the 10 p.m. drink.

9:45 PM: Into the second jar, pour all of the olive oil, along with the grapefruit and/or lemon juice. Close the lid and shake the jar hard until the contents are thoroughly blended.

10:00 PM: Drink the olive oil and citrus juice standing up. Take the optional ornithine with the first sips. Drink it all immediately; but if you're weak or elderly, you may drink it over a period of 5 minutes. *Lie down* on your right side for at least 30 minutes, with your knees up to your chest in a fetal position. The sooner you lie down, the more stones you'll eliminate. The oil you drank—much more than the body normally processes at one time—will cause the liver and gallbladder to spasm and dump all available bile, along with stones, gravel and crystals. You may feel stones traveling along the bile ducts. After 30 minutes, you may lie on your back. If you can't sleep, try to remain in bed for another 20 minutes. After that, if you feel nauseated, take ½ (or 1) teaspoon of activated charcoal with 1 (or 2) glasses of water.

Chinese medicine reminds us that the liver is sensitive to feelings of resentment, vindictiveness, and hate. The expression "venting bile" refers to someone who is very angry. So send positive, loving thoughts to your liver.

Procedure – Day 2

Next morning (6:00 a.m. or later): Take your third dose of the Epsom salt solution. If you're nauseated, take ½ (or 1) teaspoon of activated charcoal with 1 (or 2) glasses of water, wait an hour, and then drink the Epsom salts. The Epsom salts act as a laxative, and will induce many loose bowel movements later.

2 hours later: Take your fourth (and last) ¾ cup of Epsom salts. Go back to bed if you want.

After 2 more hours: You may get up and eat. Some people prefer something light, while others want to eat normally immediately. Expect to have diarrhea on this second day. This is normal, due to the effect of the Epsom salts.

Liver/Gallbladder Restoration

Foods. The liver is one of the most important organs in the body. If it cannot do its job of neutralizing poisons, severe illness develops and ultimately death may occur from autointoxication. People who gobble a fast food burger, milk shake, and fries don't think about how this meal is affecting their liver, but caring for the liver means eating real foods. Fake fats, gluten, alcohol, chemicals, refined carbohydrates, and sweeteners (including fructose)—all discussed earlier in this chapter—lead to poor liver function. The liver cannot perform its detox functions well, either, if the diet lacks adequate protein.

The best liver maintenance is fresh squeezed lemon juice in warm water (no sweetener), in the morning on an empty stomach. Lemon juice helps the liver produce enzymes and regulate blood carbohydrate levels. Lemon is a natural killer of harmful bacteria. And it's an antioxidant, scavenging free radicals that are released into the bloodstream during digestion.

Other foods that support the liver include leafy greens, avocados, sulfur-rich foods such as onions and garlic, grapefruit, beets, carrots, and cruciferous vegetables such as cabbage, broccoli and cauliflower. Cruciferous vegetables help activate two critical liver detoxifying enzymes that help flush out toxins.

Herbs. One of the most well-known (and studied) herbs for detoxifying and protecting the liver is milk thistle, also known as *silymarin*. Found in milk thistle seeds, silymarin is a unique antioxidant flavonoid complex that regenerates liver cells, scavenges free radicals, and stimulates bile flow. Silymarin can safely be taken over long periods of time.

Some herbs and spices used in cooking also heal the liver. Herbalist Richard Schulze, who was a student of the renown Dr. John R. Christopher, used many common plants for optimal liver function. Here's an example of the combined ingredients in two of Schulze's formulas: burdock root, dandelion root, cardamom seed, clove bud, ginger root, pau d'arco bark, cinnamon bark, fennel seed, licorice root, juniper berry, black pepper, uva ursi leaf, horsetail, parsley root, orange peel, milk thistle, Oregon grape root, gentian root, wormwood leaf, chaparral leaf, black walnut hull, ginger root, garlic, and artichoke leaf. Collectively, these ingredients flush and detoxify the liver, gallbladder and blood; stimulate the liver to produce more bile; protect liver cells; remove hardened sediments (stones) from the gallbladder; stimulate the digestive tract, eliminating gas and indigestion; increase the flow of urine; and even act as a tonic for the immune cells. No pharmaceutical can perform even one-quarter of these functions!

Coffee Enemas. Earlier, when discussing the colon, I described coffee enemas in detail. In addition to clearing (and possibly normalizing the shape of) the colon, a coffee enema is one of the most powerful healing protocols you can use for the liver. During a coffee enema the liver is stimulated to produce bile, which binds toxins that the body then excretes through the colon. A coffee enema is inexpensive and can be administered at home. The prior text on coffee enemas provides details.

Liver-Gallbladder Cleanse. In addition to a coffee enema, the major cleanse for both the liver and gallbladder involves ingesting olive oil, citrus juice and Epsom salts, at specified times, in under 24 hours. Most people feel much lighter afterwards, with fewer (or no) allergies and better digestion. Over time, with subsequent cleanses (and of course good nutrition), people also report passing fewer (if any) stones. "Stones" may consist of shapeless specks or round masses, sometimes even half an inch (about 12 mm). Mainstream medicine claims that this cleanse is useless, and that the stones expelled by the cleanse are actually solidified oil. But this isn't true. See Insert, pages 465–466, "Liver–Gallbladder Cleanse."

Kidney Cleansing

Kidney Function and Physiology

People normally don't think much about their kidneys until the organs start to malfunction. But by that time, any noticeable symptoms indicate that there may already be damage, even severe structural changes. It's best to support your kidneys before they get into obvious trouble.

According to Traditional Chinese Medicine, the kidneys are the storehouses and predictors of one's life force. The amount of energy a person has depends on the vitality of the kidneys, which is fixed at birth. However, what we were born with can be strengthened. We should treat our kidneys as delicate and special, because they are.

Each day, the kidneys process about 200 quarts (about 189 liters) of blood. A very complex network of tubules filter out undesirable substances to prevent them from getting circulated back into the bloodstream. These tiny particles of waste are excreted with the urine. "Waste" may consist of exogenous and endogenous chemicals. It may also contain electrolytes or substances produced by the body such as beneficial hormones, that the system cannot use at the moment that these materials are being passed through the filtration tubules.

The kidneys constantly monitor the balance of electrolytes and water, making adjustments to either recirculate minerals back into the body or excrete them.

These electrolytes help determine the amount of water that stays inside a cell versus the amount of water that's released outside the cell. The kidneys also produce a protein called *angiotensin*, which signals the body to retain salt and water when necessary. If this mechanism isn't working correctly, blood pressure problems result.

Common symptoms of kidney ailments are pain with urination, abnormal fluid retention, and lower back pain.

Kidney Restoration

Two of the most common problems with the kidneys are urinary tract infections and kidney stones. Infections tend to be from bacteria—usually *E. coli*—that enter the urinary tract through the urethra, where urine exits the body. Stones are crystallized mineral salts (often high in calcium) that haven't been able to dissolve. The kidneys tend to collect stones when there's an infection in the urinary tract, or when one is dehydrated. The universal cure for any ailment of the kidneys is pure, mineralized water, which flushes out the urinary tract.

Foods. Eating properly is vital to support the kidneys. For any type of kidney problem, it's important to limit the consumption of excessive concentrated (animal) protein, and completely eliminate fried foods, excess salt, spices, dairy products, black tea, coffee, and alcohol—all of which can irritate the kidneys. Sugary foods are also discouraged, because the increased insulin resulting from sugar intake raises the calcium levels in the blood, and calcium is a primary material that comprises kidney stones. Oxalic acid (oxalates) is also a component of such stones, so people who have kidney stones should avoid high-oxalate foods until the situation improves. High oxalate foods include spinach, beet root and greens, leeks, sweet potatoes, Swiss chard, rhubarb, okra, almonds, peanuts, pistachio nuts, hazelnuts, beans, lentils, quinoa, and dried figs. Soy, as a questionable food source (see earlier in this chapter, page 308), is out of the question.

Herbs. For infections, one of the best tonics for the kidneys is unsweetened cranberry juice—not the commonly available commercial kind, which is loaded with sugar or high fructose corn syrup, but pure unadulterated cranberry juice concentrate, which is very sour. That, and cranberry powder in capsules, can be bought at a health food store. Although naturally tart, cranberries are rich in D-mannose, a sugar that coats the walls of *E. coli* and prevents the bacterium from sticking to the urinary tract walls. (Urination alone cannot flush out the bacteria.) Although D-mannose alone can also be taken, as a powder or in capsules, cranberry juice may be a better choice as it acidifies the urinary tract as well, which is desirable.

To eliminate kidney stones, Dr. Julian Whitaker recommends drinking 2 to 3 quarts a day of water. He points out that University of California researchers found that just 4 ounces of lemon juice diluted in the water further reduces the numbers of stones, dramatically.

Herbs that are healing to the kidneys can be taken in the form of tinctures and teas. Herbalist Richard Schulze, who also possesses a doctorate in natural medicine and herbology and other degrees relating to herbal pharmacology, has compiled several formulas for the kidneys. He uses juniper berries, corn silk, uva ursi leaf, parsley root, horsetail, goldenrod, hydrangea root, gravel root, marshmallow root, orange peel, peppermint leaf, and burdock root. Collectively, these herbs promote and support healthy urine flow, disinfect the urinary tract, and dissolve minerals (including deposits and stones) in the urinary tract. Even just drinking fresh squeezed lemon juice in warm water (without sweetener), on an empty stomach, helps inhibit the formation of kidney stones due to the naturally occurring citric acid in lemons. You can find preparations for the kidneys at herbdoc.com.

The Lungs

Lung Function and Physiology

The lungs take in oxygen for us and keep us alive, but they also cleanse. This is especially important today, with rapidly escalating levels of airborne contaminants that now include nuclear radiation (discussed earlier) and chemtrails (see Chapter 5).

The entire respiratory tract is essentially one long, connected series of tubes that branch out into two billowy balloons: the two lobes of the lungs, located on either side of the heart. A single tube—the muscular, cartilage-rich trachea (windpipe)—begins in the throat, dividing into two branches (bronchi) in the chest, and further subdividing into many more branches inside the lungs (bronchial tubes or bronchioles, and the smaller alveoli). At these millions of alveoli in each lung, gases diffuse through the membranes. Inhaled oxygen seeps from the lungs into the capillaries, and carbon dioxide seeps from the capillaries into the lungs, where it's exhaled.

Proper breathing requires good lung elasticity, effortlessly contracting and expanding intercostal muscles (which move the rib cage up and out), and a freely moving diaphragm, the muscle that creates negative pressure within the rib cage area so the lungs can fill up with air. Earlier I discussed the emotional component of breathing. People typically hold their breath to suppress unpleasant or painful emotions. If the feelings are not acknowledged and managed, the need to keep them below the level of

conscious awareness ultimately leads to an unconscious, chronic holding of the breath. This further contracts the diaphragm and intercostal muscles, inhibiting breathing even more. Dealing with emotional repression is important, because shallow breathing makes it more difficult for the lungs to eliminate debris. Smoking, infections, and allergic swelling also restrict breathing.

How do the lungs protect themselves from irritants? Most tissues in the body are directly connected to supplies of blood and/or lymph, which carry away debris. But particulates are trapped inside the bowl-like lungs, which must therefore rely on two cleaning agents. The first of the cleaning crew are the mucous membranes that coat the entire respiratory tract. Comprised of water and ionic minerals, mucus possesses some antimicrobial and antioxidant properties. The other cleaning crew members are the cilia, tiny hairs that line the respiratory tract and wave in a rhythmic, beating motion. The hairs lining the nasal passages filter large particles, but it's easy for smaller particles to reach the lungs. Therefore, about three ounces of mucus are secreted onto the lining of the breathing tubes each day, which trap the particles. The microscopic cilia sweep the particulates, trapped inside the mucus, up from the lungs—either toward the nostrils, where it is sneezed out, or toward the pharynx at the back of the throat, where the mucus is funneled down the digestive tract and is eliminated with the rest of the body's waste. Most people swallow this phlegm. However, as the mucus may contain infected material and toxins, rather than burden the digestive tract it's better to eliminate the mucus by coughing or spitting it out.

Lung Restoration

One of the chief nutrients for the lungs is Vitamin A. As Vitamin A is stored in adipose (fat) tissue, it remains in the body for longer periods than do water-soluble vitamins. Nevertheless, Vitamin A depletion is common in most people, especially if they're exposed to cigarette smoke. Add the high levels of pollutants we're all forced to breathe, and you can see why Vitamin A is so important. The air sacs in the lungs can heal if enough Vitamin A is present, obtained either from food (especially liver and raw milk) or from nutritional supplements. Be aware that the carotene in carrots, dark leafy greens and other vegetables is a precursor to Vitamin A, not the true vitamin, and not everyone can make the conversion.

Many herbal teas are good for the lungs. Some are *expectorants*: they bring up mucus and other material from

the lungs by signaling the body to secrete more mucus and water. Such herbs include cardamom, fenugreek, fennel, and thyme. Green tea, an antioxidant, also helps prevent damage to the lungs. Of course, water is a necessary ingredient for the production of mucus.

The simplest way to heal the lungs (and sinuses too) is by inhaling a therapeutic ingredient. If you have a medical grade ozone unit, you can breathe the gas through olive or essential oils. (See information on ozone therapies earlier in this chapter.) Sometimes, simply breathing in steam made from filtered water is enough. One very effective protocol is *halotherapy*, breathing in salty vapors

(from the Greek word *halo*, which means "salt"). The salt draws out water and kills bacteria. An increasing number of studies show excellent results from inhaling salt-infused vapor. In 2006, the *New England Journal of Medicine* found improved breathing in people with both cystic fibrosis and asthma.²⁷⁴ Small ceramic chambers that hold salt and have air holes for inhalation can be bought for home use for about twenty dollars.

Nebulizing (or atomizing) is another simple, effective protocol you can do at home. A medical nebulizer is a small, portable electronic device that delivers fluid into the lungs via either compressed air or ultrasonic power. The fluid (which is placed inside a chamber in the unit) is broken up into a fine mist, and then dispersed into the lungs through a mask that's held against the nose. Some nebulizers can be obtained for as little as fifty dollars. Nebulizers were originally designed to deliver drugs, but there's no reason you can't use colloidal silver and essential oils, or 10 parts colloidal silver to 1 part of food grade DMSO (which helps drive the silver into the tissues). To give you an idea how this equipment can be used, I'll tell you a true story.

Several years ago, a friend of mine I'll call Greta visited me from the Netherlands. She was coughing from the moment she arrived. Although she insisted that she felt fine, I was alarmed. Her incessant cough was a harsh and grating bark, and it came from deep within her chest. I'm not a medical doctor, but I trust my intuition. The phrase "walking pneumonia" immediately popped into my mind. Although she felt exhausted, Greta had been pushing herself to sightsee. The American Southwest desert, where I had made my home, was spectacularly different from what she was accustomed to seeing in her native Holland, and she didn't want to miss a thing.

I had to yell at Greta several times to slow down, which she finally did, reluctantly. She had three rife sessions and

**There's so much pollution
in the air now that if it
weren't for our lungs,
there'd be no place
to put it all.**

—Robert Orben
American comedy writer,
speechwriter, and magician
(born 1927)

visited the sauna twice. (The sauna therapy section begins on page 481.) Greta also took lots of Vitamin C, along with a few natural antibiotic herbs (goldenseal, Oregon grape root, and echinacea). However, what I observed that helped her the most—because it directly addressed the afflicted area, her lungs—was nebulizing.

We filled the chamber of my medical nebulizer with homemade colloidal silver, to which we added an essential oil mixture consisting of eucalyptus, oregano, and lemon. The essential oils possess antibacterial and antifungal properties. Only two fragrant drops were added because essential oils are so concentrated and potent, that some of them can burn tissue if they're not diluted. Then Greta turned on the motor and started inhaling the spray of colloidal silver plus essential oils.

My friend instantly felt relief. She preferred this protocol to Rife Therapy, she said, because it didn't take as long. And she liked it much better than a sauna because she didn't enjoy sweating. Greta gave herself at least four, and perhaps six, 15-minute sessions. When she finally left for home, she was feeling a lot better. She was still coughing lightly, although not as often. And her cough was gentle; it didn't rattle throughout her entire chest.

Several months later, Greta telephoned me. She said that just before her visit with me, she'd been with another friend. She only recently discovered that shortly after she left this friend, the woman was hospitalized with walking pneumonia. Greta was certain that she had caught the airborne pathogen from her friend—but because she had taken care of herself in my home, using natural methods, she was able to avoid a potentially lengthy stay at a hospital.

You will very quickly know, with three or fewer 20-minute nebulizer sessions, if this is what you need. Alternatively, you can put colloidal silver into a cold steam vaporizer or an ultrasonic humidifier overnight. If the unit has a filter, remove it so the silver particles reach your respiratory tract instead of becoming trapped. If the ultrasonic mechanism is metal, wipe it clean once a week. You can help yourself a lot, just by inhaling.

Lymph Clearing

The main function of the lymph is waste elimination. You may recall, from the earlier **Exercise** section, that lymph tissue is dense and requires movement to get it to flow.

Exercise, massage, and bouncing on a rebounder have been previously mentioned as helpful to circulate the lymph. Another simple, yet effective, procedure is immersion in hot and cold water in a shower or tub. Heat causes the tissues to expand and cold causes the tissues to contract, so doing several cycles of heat alternating with cold will pump the lymph. Using water in this way

is basic *hydrotherapy*. It's used in many parts of the world, especially in enlightened parts of Europe that abound in natural hot springs and sulfur pools. Hot springs resorts also feature cold tubs for just this purpose.

Herbs are helpful for the lymph as well. Astragalus increases energy and stamina, is an antioxidant, and has antibacterial and antiviral properties. It's also a mild diuretic and helps move excess fluid (including lymph) in the body. Echinacea combines well with astragalus. Similarly antimicrobial, it also helps reduce congestion and swelling of the dense lymph. You can also rub essential oils of geranium, juniper, and black pepper onto the skin. Essential oils should usually be diluted, or else they're too harsh. A good ratio is 15 drops in one ounce of carrier oil such as almond, avocado, or jojoba.

Activated Charcoal, Clay, and Castor Oil

Activated charcoal, clay, and castor oil are so effective that their health benefits sometimes seem miraculous. Although these three substances may be relegated to the category of "folk remedies" by establishment medicine, don't let their label, simplicity, or low cost fool you. They all draw out poisons from the body, each in a unique way. In addition to their detoxification function, each has special properties—especially clay and castor oil, which help revitalize cells and even kill pathogens. All of these ingredients can be used externally and internally as long as they are food grade, without contaminants.

Activated charcoal and clay belong to a class of substances known as *adsorbents*. That's "adsorbent" with a *D*, not "absorbent" with a *B*. Despite the variation in only one letter, the two are very different. During the process of *absorption*, atoms, ions or molecules of a substance *penetrate or are sucked inside* other molecules, and become part of the physical structure of whatever solid or liquid has drawn them in. During the process of *adsorption*, the atoms, ions or molecules of a substance *adhere only to the surface* of another substance (the adsorbent). As adsorbents, both activated charcoal and clay draw other materials to them, which attach or fuse to their surfaces.

Being ionically unstable, activated charcoal and clay hold a negative electrical charge. (An *ion* is an electrically charged atom or group of atoms, whose unstable electrons in the outer ring naturally seek to bond with electrons from another source to become stable.) Because of this negative charge, they seek positively charged substances—which happen to be toxins. "In the human body," writes Ran Knishinsky in *The Clay Cure*, "when clay is taken internally, the positively charged toxins are attracted by the negatively charged edges of the clay mineral. An

exchange reaction occurs whereby the clay swaps its ions for those of the other substance. Now, electrically satisfied, it holds the toxin in suspension till the body can eliminate both.”²⁷⁵ The author is describing clay, but this quality also pertains to charcoal.

This binding of charcoal and clay to toxins is energetic in nature, not chemical; neither adsorbent undergoes any changes itself. This ability to pull out toxins from the body makes them powerful healing agents. They are used all over the world. Castor oil pulls out toxins in a similar way.

Activated Charcoal

Origin of Activated Charcoal. Many people are familiar with common charcoal, a barbecue fuel. Common charcoal is a byproduct of incompletely burned wood and no longer contains water, just carbon. Activated charcoal, or AC (sometimes called activated carbon), is similar to charcoal, but with some important differences.

Neither food, drug, nor mineral, AC is completely inert. Activated charcoal not intended for internal use is sometimes made with sawdust, and occasionally bone, peat, or coal. Food grade AC is often made of hardwood, though an ecologically superior choice is coconut shell. The charcoal is created by heating the hardwood or coconut shell at very high temperatures, around 1,000°F (538°C). This eliminates the volatile organic compounds, leaving behind only the carbon. The charcoal becomes “activated” when it’s exposed to oxygen (either in gaseous form or from steam) at high temperatures. This activation erodes the charcoal, creating highly porous, exceptionally fine particles with a huge surface area. To give you an idea how huge, 50 grams of AC, powdered to a very fine particle size, has the surface area of 10 football fields.

It’s the tiny pores in activated charcoal that make it porous and adsorptive. Many carbon-based impurities and toxic chemicals are attracted to the numerous tiny bonding sites of AC, where they accumulate and become trapped: so-called organic chemicals, chlorine (making it ideal for water filters), and other poisons.

Charcoal can be made into larger particles between 0.5 and 4 millimeters (mm), and smaller ones between 1 and 150 microns. Industry uses coarse particles, but for internal consumption and health uses, the finer particles are best.

Activated charcoal is completely safe, odorless, and tasteless. It costs pennies, especially when bought in bulk. It can neutralize thousands of times its own weight in gases, heavy metals, toxins, chemical poisons, pathogens, and the wastes from pathogens. The healing effects of AC were known at the time of Hippocrates (460–370 BCE)—if not earlier, around 1550 BC, by the Egyptians.

Properties of Activated Charcoal. Activated charcoal is very efficient in removing odors. This is because it neutralizes the noxious agents that cause the odors. Activated charcoal is used in thousands of items, including vacuum cleaners, military gas masks, kidney and liver dialysis equipment, and (most commonly) water treatment filters for both household and huge municipal systems.

Here is a summary of substances that AC adsorbs. Note that this is not a complete list:

- ◆ *Heavy Metals (Some).* Includes mercury and tin.
- ◆ *Inorganic Pollutants.* Includes chlorine, hydrogen sulfide, and radon.
- ◆ *Some Hydrocarbons with Systemic Toxicity.* Benzene and others, on a case-by-case basis.
- ◆ *Most Medications.* Includes acetaminophen, aspirin and other salicylates, tricyclic antidepressants (such as fluoxetine, also known as Prozac®), amphetamines, barbiturates, cocaine, cold medicines, morphine, narcotics, opiates, and penicillin.
- ◆ *Obvious Poisons and Alkaloid Toxins.* Includes arsenic, caffeine, cyanide, hemlock, nicotine, strychnine, and theobromine (a volatile oil in coffee).
- ◆ *Pesticides and Herbicides.* Includes chlordane, DDT, malathion, and parathion.

Despite activated charcoal’s versatility and ubiquitous presence, its reputation as a “universal antidote” is an error. While the list of what AC adsorbs is impressive—over 4,000 substances—there are some substances that AC does *not* adsorb well, or at all. This is important to know, especially in cases of accidental poisoning. You want to use the appropriate protocols and not waste valuable time, at the possible cost of someone’s life. The following is not a complete list, but some of these substances include:

- ◆ *Strong Acids.* Includes battery acid (sulfuric acid). (*To neutralize, take baking soda in water.*)
- ◆ *Alcohols.* Includes acetone, ethanol, glycols, isopropyl alcohol, and methanol.
- ◆ *Strong Bases.* Includes ammonia, lye, bleach, oven and drain cleaners. (*To neutralize, take vinegar in water.*)
- ◆ *Hydrocarbons.* Includes gasoline, kerosene, naphtha (ingredient in lighter fluid), toluene, and xylene.
- ◆ *Metals and Inorganic Minerals.* Includes lead, and boric acid, fluorine, iodine, iron and sodium (in excess).
- ◆ *A Few Medications.* Includes lithium carbonate.

Note that iodine, iron, and sodium are not poisons per se. But it's possible to take too much of them—in which case, knowing that AC won't help, allows us to use other methods that are actually effective.

AC is routinely given at hospitals to people who have accidentally swallowed poisons, taken too much or the wrong kind of medication, or eaten spoiled food. The charcoal should be taken within 30 minutes of ingesting a toxin because after a little over an hour, most or all of the poison is already coursing through the bloodstream.

Charcoal adheres to toxins in the stomach and intestines, and is eliminated with the feces. However, the toxins might not be eliminated with just one dose, explains John Dinsley in his book *Charcoal Remedies: The Complete Handbook of Medicinal Charcoal and Its Applications*.

Charcoal has the ability to adsorb drugs in the enterohepatic circulation cycle (intestinal-liver circulation loop), significantly clearing them from the bloodstream. Normally, the liver filters poisons from the bloodstream. These poisons are then added to the liver bile, and together they pass back into the intestinal tract for elimination. But it is possible for some drugs to be reabsorbed by the intestines and then back into the blood system before they are [finally, after more similar cycles,] voided in the stool. Therefore, several days of repeated doses of charcoal is still a good treatment for poisons that may otherwise remain in the blood for a long time.²⁷⁶

Bryan Rosner, author of many books on Lyme disease, offers an interesting and complementary perspective on using adsorbents such as charcoal. As you read, keep in mind that charcoal's ability to bind to bile makes it very useful during a liquid fast, liver cleanse, or other cleanse.

The use of binders [in other words, adsorbents] is critical because a large portion of the bile that is secreted by the liver and gallbladder into the digestive tract is absorbed and reused by the body. This recycling is very efficient and allows the body to conserve resources by producing less bile. However, the toxins contained within the bile also get absorbed when bile is absorbed. . . . [Because most of the toxins, including metals] end up in high concentrations in the bile, gut binders can be very helpful in efficiently binding to the bile and its toxins, and ushering them out of the body. When using binders extensively, it can be helpful to consume foods known to help the body make bile, since some bile will be eliminated from the body rather than absorbed.

Binders are not only beneficial because they sequester and usher toxins out of the body. They also facilitate the process of bringing deeper toxins stored throughout body tissues into the gut for elimination. . . . Sequestering and removing bile from the body essentially prompts the body to create more bile, fill it with toxins, and get rid of it, so the use of gut binders has the secondary benefit of accelerating the body's detoxification processes.²⁷⁷

How To Use Activated Charcoal. Activated charcoal comes as a bulk powder, in capsules, and pressed into tablets. Even the coarser grained particle powder is so light and fine that when it's mixed in water, it floats into the air like a black, slow-motion cloud. (This quality has made AC popular with special effects personnel working in the film industry who want to create spooky scenes.) However, for poison control, AC is best used in particle form. Although the black dust travels, and a bit of scrubbing is needed to remove it from clothing and furniture, plain AC mixed in water is the quickest and most efficient way of getting it into your system. If you've ingested a toxin, you want the AC to start working immediately. Activated charcoal capsules, and especially tablets, take time to dissolve. Also, tablets contain fillers and binding agents that are necessary to hold the ingredients together. Studies have shown that tablets are only about half as effective as pure AC in water. Depending on how much water is used, the AC solution can be a watery fluid, or the consistency of a thick soup (also known as *slurry*).

How much charcoal should be ingested in cases of poisoning? Or for binding, in the gut, toxins that may have been in your body for awhile? Different amounts are recommended by different sources. However, it's virtually impossible to overdose on AC (except for the need to drink enough water to avoid constipation), so the general rule seems to be: "Take as much as possible if there's immediate danger from acute toxicity. If the toxicity is chronic, less AC needs to be taken, but it should be used over a longer period of time." Dinsley explains using AC for poisoning.

While most people usually think of poisoning as a single event, we need to be reminded that the body is continually dealing with waste products from digestion and metabolism. The organs employed in filtering and purifying the blood can always use some extra help.

As a general detoxifier, charcoal is without equal. It purifies the six to eight liters of digestive fluids that are secreted daily. This in turn helps to remove foreign substances from the blood.

How To Use Activated Charcoal

People with inflammation and perforations of the colon—conditions such as ulcerative colitis, irritable bowel syndrome (IBS), and Crohn’s disease—should not take activated charcoal internally. However, in such cases it’s safe and effective to apply poultices externally, over the digestive area.

INTERNALLY: For Acute Poisoning (from Food, Chemicals, Medications). Take charcoal within 30 minutes of ingesting the poison. The longer you wait, the more toxins will circulate in your bloodstream and cause systemic damage (or death). It’s impossible to overdose on charcoal, so if it’s urgent, take too much rather than too little. However, drink plenty of water. Otherwise, you risk severe constipation.

- ◆ *Immediately* drink 4 tablespoons (about 40 grams) of AC mixed with enough water to make a thick slurry. Dinsley suggests up to 10 tablespoons (if the stomach’s contents reduce charcoal’s adsorption by up to 50%); children should take half this adult dose. *Activated Charcoal for Medical Applications* advises 1 gram per kg of body weight for adults; 25–50 grams for children; and in general, 10 grams of activated charcoal for each 1 gram of poison ingested. Another formula is: the amount of AC should be 8–10 times the weight of the poison.
- ◆ Fill the same glass or jar with more water and drink the water, along with any remaining charcoal sediment.
- ◆ If your digestion is normal and you have eaten in the past 2 hours, more AC will be needed than the suggested amount. Also, if your digestion is sluggish and you have eaten in the past 3 hours, more AC will be needed.
- ◆ Repeat the AC amount in 10 minutes, and/or if the symptoms become worse.
- ◆ Taking capsules or tablets will delay the benefits of the charcoal. However, if you only have capsules, open them and pour the appropriate amount of AC into the water. If you only have tablets, chew them thoroughly and follow with water. Tablets are only about half as effective as powder because they contain fillers, so take more.
- ◆ Consider using an AC poultice as well. See instructions below for external use.
- ◆ If possible, get to a hospital so you can be monitored. (However, not everyone feels it necessary to do this.)

INTERNALLY: For Chronic Systemic Toxicity (such as Toxins from Mold, *Candida*, or Lyme). Drink enough water.

- ◆ Take 1 tablespoon (or 25–100 grams) of AC powder, mixed with enough water to make a thick drink or slurry. Follow with 2 full 8-ounce glasses of water. Take this 2 hours away from food (or 3 hours away, if your digestion is sluggish).
- ◆ If you have capsules or tablets: Take 4 capsules twice a day, or 6–8 tablets 2 to 4 times a day. Follow with 2 full 8-ounce glasses of water. Take this 2 hours away from food (or 3 hours away from food, if your digestion is sluggish).
- ◆ Follow this protocol until the systemic toxins are eliminated. This may take weeks or even months. Internal use can be combined with external poultices; see below.

EXTERNALLY: Poultices for All Wounds (ingrown toenails, gangrene, swelling anywhere), Insect and Animal Bites, and Systemic Toxicity (over the liver, stomach, belly, kidneys, appendix). You can augment the effects of ingested AC by applying poultices. AC poultices can be messy, so use clean rags that can get permanently stained. Cover poultices with plastic wrap. Cover whatever you’re lying or sitting on with an old towel or plastic. Poultice must be wet at all times. When the poultice dries, make a new one. Two or three a day are suggested.

- ◆ *Immediate Relief:* Make thick paste of AC and water. Apply directly to affected area. Change dressing often.
- ◆ *Immediate Relief for Open or Oozing Wounds:* As long as the sore or wound is clean, you can sprinkle dry AC powder onto it and cover with a clean cloth. Make a new poultice of AC paste when the wound scabs and is dry.
- ◆ *Longer Lasting Relief:* Put a paste of AC and water into a pocket made of paper towel or loosely woven cloth (like cheesecloth). Tape cloth to affected area.
- ◆ *Variations of Lasting Relief Formula:* Half AC, with half of either: slippery elm bark, flaxseed, tapioca starch, arrowroot, chia seeds, clay. This combo formula works better for overnight and longer periods than plain AC paste.
- ◆ *Snake Bites:* Wash area with soap. Submerge in cool water with AC for 30 minutes to 1 hour to slow the circulation of venom. Cover area with large AC poultice. Change poultice every 10 minutes until pain and swelling are gone.

Tip 1. Keep charcoal powder in a tightly sealed glass, plastic or metal container.

Tip 2. To mix AC, use a small jar with a lid and shake. Then pour into a glass and drink, or use for poultice.

Tip 3. Children may accept AC more easily if the charcoal is mixed with food: mashed banana, juice, honey, jam, oatmeal or peanut butter. Some sources believe that chocolate and dairy decrease the amount of toxins the AC can adsorb.

Tip 4. For internal poisoning, do not give AC with syrup of ipecac, as the charcoal will adsorb the ipecac. Take charcoal 30 minutes after administering the ipecac, or after the vomiting from the ipecac stops.

Charcoal adsorbs the intoxicant substance and its metabolites that are excreted into the small intestine by way of the bile duct, thus preventing their reabsorption. As we have noted, charcoal adsorbs drugs that diffuse back into the stomach and intestines.²⁷⁸

This leads me to other uses of AC. Activated charcoal can be used for excess gas and diarrhea. If there is an overgrowth of *Candida albicans* in the gut, or even *Helicobacter pylori* (which causes ulcers), any die-off from these pathogens will be minimal if AC is there to adsorb the toxins. Charcoal also makes a wonderful poultice—either plain, with a minimal amount of water to form a spreadable paste, or with ground flax or other ingredients added to create a jelly-like consistency. With a poultice, toxins in the blood are drawn right through the skin. Poultices are good for wounds, swelling (even for areas you might not think would be helped, such as the prostate gland), and bites from insects and snakes. Furthermore, poultices can be used for internal poisoning. When placed over the liver and abdominal region, a charcoal poultice can expedite the healing process even more than if the AC were solely being consumed internally.

Opinions differ about whether AC depletes the body of nutrients as well as toxins. Dinsley writes:

Russian researchers found that activated charcoal efficiently adsorbed toxins before these poisons could compete with oxygen and nutrients that were trying to pass through the cell membrane. . . . Instead of adsorbing essential food elements, charcoal removes toxins that are competing with nutrients for intestinal and cellular adsorption, thereby promoting efficient nutrient uptake. Those studies that suggest vitamins may adsorb to charcoal were done under abnormal laboratory conditions. . . . If there is any adsorption of nutrients, it is so negligible that it has yet to be shown to compromise one's health. For instance, charcoal has been used for many years as a fecal deodorant for patients with ileostomies and colostomies. In spite of the fact that they may routinely take charcoal orally three times daily for years, it has never been demonstrated to nutritionally affect these individuals who are already at risk for nutritional deficiency.²⁷⁹

People often question if food in the digestive tract interferes with the ability of AC to adsorb poisons. While anything in the stomach might act as a barrier and prevent enough AC from being in contact with a poison, the good

news is that a lot of food in the stomach is likely to slow the transit of the poison into the bloodstream. Ultimately, though, this point is academic. Whether or not food has been ingested, if a toxic substance gets into the digestive tract, the solution is to take charcoal. David Cooney, author of another book on AC, writes that “in an actual overdose or poisoning situation, the physician may have no knowledge of (1) the quantity of drug ingested, and (2) whether or not the digestive tract contains significant food. Additionally, it may not even be known what kind of drug was taken. Moreover, drugs vary enormously in their toxicities, rates of absorption, and the specific effects [produced by overdoses]. . . . Since charcoal is harmless, the only limiting factor is the quantity the individual is willing to accept . . . It would seem that 100 grams [about 3.5 ounces of] charcoal would be sufficient for nearly all cases.”²⁸⁰

There is some scientific evidence that taking charcoal with supplements doesn't prevent the body from utilizing nutrients. A famous study by Russian gerontologist Dr. V.V. Frolkis and colleagues demonstrated that laboratory rats fed a little bit of charcoal with their food experienced increased lifespans by as much as 34%.²⁸¹ “Microscopic tissue examination,” summarizes Dinsley, citing more research conducted on charcoal, “shows that a daily dose of activated charcoal may prevent many cellular changes associated with aging—including decreased protein synthesis, lower RNA activity, organ fibrosis . . . [and] sclerotic changes in the heart and coronary blood vessels. . . . Charcoal [also] lowers the concentration of total lipids, cholesterol, and triglycerides in the blood serum, liver, heart and brain.” One study of people with high cholesterol, published, in a 1986 issue of the British journal *The Lancet*, stated that “two tablespoons (eight grams) of activated charcoal taken three times a day for four weeks, lowered total cholesterol 25%, lowered LDL cholesterol 41%, and doubled their HDL/LDL (high-density lipoprotein/low-density lipoprotein) cholesterol ratio.”²⁸² We know, from Dr. Carel's chicken heart tissue whose mineral bath was changed daily, that toxins play a significant role in aging. (See page 255 for more details on the experiment.) If charcoal is in the gut to bind to those toxins, it prevents them from recirculating in the body, thus shielding our cells from additional chemical stressors. If the experimental AC-fed rats lost substantial nutrients, their life spans wouldn't have increased. Thus, we can reasonably conclude that taking AC with food is safe.

Nevertheless, some people prefer to be cautious. They wait a couple of hours after ingesting AC before taking nutritional supplements or necessary medications (except, of course, in cases of poisoning).

Charcoal can be used alone, with clay (discussed next), or with other binding agents for the gut such as plant sterols. One good plant sterol formula is Cholestepure from a company called Pure Encapsulations. It's often used instead of the pharmaceutical cholestyramine, which upsets the stomach. The combination of AC and Cholestepure especially helps the body eliminate mold and Lyme toxins. When taking Cholestepure, it's ideal to have some fat in the digestive tract to stimulate bile flow, as any toxins circulating in that bile will be available for adsorption by the charcoal in the small intestine. The way coconut oil is metabolized by the body doesn't require bile; but any other healthy fat is fine.

Because activated charcoal rises into the air like thick black smoke when it's stirred in water, it can spread and get messy, staining whatever it touches. Nevertheless, this is a small price to pay for such a versatile product. AC is indispensable for detoxing from poisons or allergenic foods. I wouldn't be without it.

Terramin Clay Promotes Bone Growth

In the 1960s, the National Aeronautics and Space Administration discovered that weightlessness causes bone deterioration in astronauts. By itself, calcium supplements weren't effective. But Terramin, a reddish California clay, was. Benjamin Ershoff of the California Polytechnic Institute reported that the clay's calcium was absorbed more efficiently. Also, other valuable, unknown ingredients in the clay helped the body utilize calcium from any source.

roll in it when injured. Just a few creatures on an extensive list are baboons, bats, bear, buffalo, cattle, chimpanzees, coyote, deer, elephants, elk, giraffes, gorillas, rabbits, rats, sheep, wolves, and even fish. One documentary shows hundreds of South American parrots feasting on clay at the side of a cliff before dining on fruit known to contain toxic seeds. The clay in the stomachs of the birds binds to the poison in the seeds—thus rendering it harmless—while providing minerals for the birds.

Humans instinctively eat clay as well. In tribal cultures of Asia and Africa, pregnant women consume clay to assist the development of the fetus. In Russia, pregnant women sometimes use clay to not only prevent morning sickness but also ensure an easier birth. “Detoxification and mineral supplementation as functions of geophagy,” published in the February 1991 issue of *American Journal of Clinical Nutrition*, describes how in many parts of the world, clay consumption is normal for humans and animals because of the nutrients and detoxification benefits that it provides.²⁸³ For example, the

Clay

History of Clay Use. Many people who hear the word “clay” think of the creative mess in a sculptor's studio (or a child's preliminary attempts to be that sculptor). Perhaps this greasy earth simply reminds you of mud. If you're not familiar with clay in the context of natural medicine, you might be surprised to learn that it's one of the best kept secrets of healing—and that there are hundreds of different clays, each with their own unique healing qualities. Clay comes in many colors: green, yellow, gray, white, red, pink, or a combination of these hues. Typically, each fine grain of clay measures less than 0.0039 mm.

Clay can be ingested or used externally in poultices and baths. The proper use of clay is an art as well as a science, and more books than you might think have been written about clays and their various uses. It's impossible to provide a complete education on clay here; but I hope that, after reading, you'll feel inspired to explore clay on your own. The best source of information on clay, online and perhaps offline as well, is eytonsearth.org.

Scientists are well aware that birds and animals in the wild gravitate toward wet and dry clay deposits to eat it or

Pomo Indians of California have mixed clay into a batter of ground up bitter acorns and water before baking it. The clay neutralizes both the toxic tannic acids in the acorns and the bitterness, a taste that can often indicate toxicity.

Put another way, clay is eaten as a food; it's not an aberration. Clay consumption is very different from a condition the medical industry calls *pica*, which is the indiscriminate ingestion of inedible objects such as paint. (It's possible, however, that children diagnosed with *pica*—many of whom also eat dirt and stones—are intuitively seeking the minerals that are lacking in their diet. Therefore, they should be given clay.) I'll discuss the nutrients in clay, and its detoxification properties, in a moment.

Clays are usually named after where they are found. For example, *montmorillonite* was first named after the prefecture (town) of Montmorillon, France, where it was first identified. In the United States, the brand name under which montmorillonite clay is usually sold is called Bentonite®, because in the US it was first discovered in some rock formations extending from Fort Benton, Montana to eastern Wyoming.

Properties of Clay. A clay's molecular structure as well as mineral content determines its properties. The types and amounts of minerals in clay vary, but in general edible clays contain calcium, copper, iron, magnesium, manganese, potassium, silica, sulfur, and zinc.

Montmorillonite is one of the most desirable eating clays and perhaps the most popular one, aside from green clay. Montmorillonite belongs to a larger category called *smectites*, which have a layered structure. Other groups include *illites* (whose particles have a much smaller surface area than smectites) and *kaolinites* (or kaolin, the main ingredient in the original formula for Kaopectate®, a non-prescription liquid for diarrhea and other digestive disturbances). Still another group, *zeolite*, is well known for seizing and binding contaminants (again, via adsorption). Keep in mind that different sources classify clays differently, so these categories are not strict.

The difference between therapeutic clay that you can eat and the clay used by artists is that consumable clay is free of contaminants, which include pathogens and miscellaneous particles. Skeptics critical of clay ingestion predictably claim that because clays contain aluminum, they're dangerous. (I don't hear these critics express concern, however, for people's declining health from exposure to aluminum in vaccines and other sources.) Clay expert Jason Eaton, owner of eytonsearth.org, has performed extensive analyses of the most extensively used edible clays. He discusses clay's purity and safety:

All of the therapeutic clays are aluminum silicates, so they're aluminum-rich. [This is also true of zeolites.] However, the aluminum is bound in crystal form, so it's completely inert. (AlSO_4 is the base compound, which is incredibly stable.) Therefore, there's no opportunity for aluminum to migrate into the body.

My analyses of the most popular edible clays do show trace amounts of lead and arsenic. However (at least in these deposits), the lead and arsenic aren't water soluble, so therefore aren't bioavailable.

In contrast, some *newly used* clay deposits show traces of mercury, cadmium, and thallium at unacceptable levels. I won't use these types of clays internally or recommend them to others, even though there's a strong probability that these metals will bind to the clay and exit through the feces.

Properly mined edible clays are sourced from at least six feet beneath the ground surface to ensure purity. None of the edible clays I've tested had any problems with pathogenic microbes. Even though there are often aerobic bacteria present by

the time people obtain these clays, the bacteria pose no harm to human or animal life. With the desert clay that I sell, once the clay is hydrated, these organisms disappear anyway.

People have nothing to worry about if they get their clay from reputable sources (although if the clay is being wild-crafted or wild-harvested, a bit more care needs to be used).²⁸⁴

Depending on the clay, its particle sizes vary. Micronized (tiny) zeolite particles can measure less than 11 microns, whereas some mica-rich French illite particles are 20 microns. When ingested, the granules from both are small enough to travel through the bloodstream and adsorb toxins from the body. Clays whose particles are too large to be distributed throughout the bloodstream are still quite effective when used externally (on the skin) in poultices.

Clay's negative electrical charge makes it a powerful magnet for toxins. Most chemical and metal toxins have a positive charge, which are drawn to and neutralized by the negative charge in clay that's many times more powerful than the positive charge of the toxins.

Except when sprinkled dry on food, clay is always used with water. Water plus clay creates either a thick clay drink or a paste-like gel (*magma*). However, they are different from each other. Even though both are produced by adding water to clay, clay water isn't simply runnier magma and magma isn't simply a thicker clay concoction. The amount of water added to the clay determines the intensity of its electrical charge. The *less water* added to the clay, the *more drawing power* it has, Eaton explains. "Each particle of wet clay is quite capable of sorpting a toxic dissolved solid or a toxic smaller particle. What it can't do is draw something from deeper in the body. Thus, adding a thin layer of clay water to a pimple or a cyst will hardly do anything; the single clay particles react to the skin surface only. But when you apply a *very thick gel*, the clay gains the power to draw out toxins from deep within the body. I've seen clay affect the bones in the legs, and every organ. The thicker it is applied, the stronger the effect. This is also why a clay bath is not comparable to clay packs or poultices used on the body."²⁸⁵ Thus, even those who find clay baths relieving may prefer body poultices. Nevertheless, clay suspended in a generous quantity of water is still highly effective when ingested. Note that if clay is eaten as a gel, it will help with deep-seated digestive tract abrasions, but enough water must be drunk soon after to prevent constipation.

Water with a slightly alkaline pH is best for drinking clay. For poultices, any clean water is fine; but it might be better to use distilled water, which turns acidic (see

How To Use Clays

Safe for humans and animals, including those with inflammation and perforations of the colon.

INTERNALLY: Eliminate Chronic Systemic Toxicity (toxins from mold, *Candida*, Lyme), and for Poisoning from Chemicals or Bacteria in Food. The best clays for internal use are bentonite, montmorillonite, and illite. For animals or fussy children, mix clay with their food.

To Make and Use Clay Water.

1. Put 1 teaspoon of clay powder into 8 ounces of water and leave overnight or for 6 or more hours. The clay will settle to the bottom of the glass, but enough will be in the solution to get into the body when you drink it.
2. Take the clay water on an empty stomach, preferably on rising in the morning or just before bedtime. Replace the water you have drunk with fresh water.
3. Repeat this process for three days. On the last day, stir contents of the glass and drink all the clay.
4. As the body adjusts to more clay, 1–3 teaspoonfuls of clay in water can be ingested at one time. Some people take clay for three days, stop for a couple of days, and resume. However, to heal serious systemic toxicity or digestive tract problems, 1–2 quarts (or liters) of clay water can be consumed daily for 6 months.
 - ◆ If eating: Wait at least 20 minutes after to consume clay water. Better yet, take clay water 1 hour before eating.
 - ◆ If taking medication: Wait at least 1 hour, or 2 hours if possible, before consuming clay water.
 - ◆ Do this for weeks or months until the toxins are eliminated. Combine internal use with external poultices (below).

To Make and Use Clay Gel (Magma).

1. Mix enough water with 1 tablespoon of clay powder to make a gel-like paste.
2. Eat the clay gel on an empty stomach, preferably on rising in the morning or just before bedtime. Pour additional water into the container to ensure that you are getting every last bit of clay.
 - ◆ If eating: wait at least 20 minutes before consuming clay magma; 1 hour before eating is better.
 - ◆ If taking medication: wait at least 1 hour, 2 hours if you can, before consuming clay magma.
 - ◆ Do this for weeks or months until the toxins are eliminated. Combine internal use with external poultices (below).
 - ◆ Pets, maintenance amount: Mix with food. Use 1/2 teaspoon for every 20 pounds of body weight.

EXTERNALLY: Poultices for Wounds, Infections, Inflammatory Conditions, Insect/Animal Bites, Systemic Toxicity (over the liver, stomach, belly, kidneys and appendix), Injuries (tendons, ligaments, muscles), and Broken Bones. Augment effects of ingested clay with poultices. You may use colloidal silver or apple cider vinegar instead of water. You may add essential oils *only*. (Flax, slippery elm, and other jelly-like substances detract from the clay's effects.) Add a little water at a time until clay is a thick paste. Clay should be at least 3/4 inch (19 mm) to 1 inch (25.4 mm) thick, and extend 1 inch beyond the targeted area. The drawing action is complete when the clay is completely dry and falls off by itself. Exception: for abscesses and ulcers, change poultice every hour. Clay poultices can be messy, so use clean rags that you don't mind getting permanently stained. Cover poultices with plastic wrap. Cover whatever you're lying or sitting on with an old towel or plastic. When the poultice dries, make a new one. Use at least two or three a day. For sinusitis, migraines, thyroid issues, ear infections: apply to back of neck with local poultices specific to problem. Even cysts deep within the body will dissolve with external poultices.

- ◆ **Immediate Relief:** Make a thick paste of clay and water. Apply directly to affected area. Change dressing often.
- ◆ **Immediate Relief for Open or Oozing Wounds:** As long as the sore or wound is clean, you can sprinkle dry clay onto it and cover with a clean cloth. Make a new clay poultice when the wound scabs and is dry.
- ◆ **Longer Lasting Relief:** Put a paste of clay and water into a pocket made of paper towel or loosely woven cloth (like cheesecloth). Tape cloth to affected area. Apply several poultices a day, especially for injuries like broken bones.
- ◆ **Snake Bites:** Wash area with soap. Submerge in cool water with clay for 30 minutes to 1 hour to slow the circulation of venom. Cover area with large clay poultice. Change poultice every 10 minutes until pain and swelling are gone.
- ◆ **Bathing for Arthritis, Rheumatism, Bone Loss, Skin Problems:** Clay water should be consistency of slurry. Start slowly with 10-minute soak, eventually soaking for 30 minutes. *Throw used clay in the trash, not down the drain.*

Tip 1. Never store or mix clay in metal. Dry clay, clay water, and magma can be stored indefinitely or mixed in glass, enamel, wood, porcelain, china, or plastic. Stir with similar non-metal utensil. Cover containers well for storage.

Tip 2. Don't heat clay or apply heat to it. Heat will negate some of clay's benefits. However, exposure to sunlight and clean air will not hurt the clay; it may energize it.

Tip 3. Always discard used clay in the trash. It will be devitalized and full of toxins.

the **Water** section earlier in this chapter), or electrolyzed acidic water, because the skin's surface is naturally acidic.

The amazing properties of clay have been scientifically and clinically verified. Here are some features of calcium montmorillonite. This popular and versatile clay:

- ◆ Is antibacterial, antiviral, and antiparasitic.
- ◆ Can bind to most toxins, including chemicals (including pesticides), mold toxins, petroleum, radiation, and free radicals (hence, clay's anti-aging effects).
- ◆ Reduces food sensitivities and improves digestion due to the adsorption of toxins in the digestive tract.
- ◆ Increases circulation and the number of red blood cells and T-cells in the body (if taken for a long time).
- ◆ Promotes detoxification because it normalizes the liver.
- ◆ Acts as a catalyst for cleansing and healing, due to either its apparent ability to mimic enzymes, or to actual enzymatic properties itself.
- ◆ Destroys unhealthy cells and helps rebuild healthy cells, tissues, and fractured bones (including vertebrae).
- ◆ Helps maintain friendly flora, proper pH in all body areas, water balance, and cellular osmotic pressure (which allows fluids to cross the cell membrane).
- ◆ Provides the body with many valuable trace minerals, which assist in all aspects of growth, cell integrity, metabolism, and body function.
- ◆ Heals inflammatory conditions; wounds, sores, abscesses, ulcers and punctures; animal and insect bites (including from the brown recluse spider); and various infections, including *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Mycobacterium ulcerans* (which causes Buruli ulcer), *Escherichia coli*, *Moluscum contagiosum* (a viral skin condition), and even the hard-to-treat MRSA (methicillin-resistant *Staphylococcus aureus*) and PRSA (penicillin-resistant *Staphylococcus aureus*).

The detoxification abilities of clays are vast. An article in a 1991 issue of *American Journal of Clinical Nutrition* states: "Clays could adsorb dietary toxins, bacterial toxins associated with gastrointestinal disturbance, hydrogen ions in acidosis, and metabolic toxins such as steroidal metabolites associated with pregnancy."²⁸⁶ Reports of clay's rejuvenation abilities are almost unbelievable. Someone emerged from a coma after poultices were placed on the forehead every two hours. A naturopath applied poultices, four a day, for a friend who'd broken his back. In six weeks he was completely healed.

How To Use Clays. For general guidelines, see Insert on page 477, "How To Use Clays." Note the few circumstances under which clay should be ingested at least one hour before medicines and nutritional supplements.

- ◆ Clay *might* interfere with the body's absorption of a prescription medication, so take the medication at least 1–2 hours before, and consult a doctor to make sure that the body is receiving the prescribed dose.
- ◆ It's highly unlikely that clay will interfere with the body's absorption of herbs, vitamins, minerals, and similar substances. However, if you're concerned, ingest the clay at least 1 hour before.
- ◆ Bentonite use can cause a minor temporary spike in blood pressure; so if necessary, consult a doctor.

Despite the above cautions that one might need to take, I have not read a single warning about using clay long-term, even for 20 years or more. Many famous and respected people throughout history have used clays for decades. Just a few of them include peace activist Mahatma Ghandi, dentist Weston A. Price (discussed earlier in the **Food** section), and medical doctor Max Gerson (1881–1959), who treated cancer with raw juices, coffee enemas, and other holistic protocols.

Practitioners of all types agree that clay is very safe. In fact, it appears to supply what the body needs, even if the clay itself does not contain it. Also, just as every sliver from a magnet retains its properties, every piece of clay retains its Earth energy. For more information about how to use clay, the conditions that clay will help heal, how to select the best clay for your purposes, and where to obtain it, go to Jason Eaton's website, eytonsearth.org.

Castor Oil

Origin of Castor Oil. Castor oil is derived from the seed of the castor plant (*Ricinus communis*, also known as "Palma Christi"). Thought to be native to Ethiopia, the robust plant grows prolifically throughout the world in moist tropical and warm temperate regions, including the southwestern United States. The castor plant can grow up to 15 feet (5 meters) in one season if the sunlight and water are plentiful. The plant is resistant to insects and has striking, many-pronged leaves in a variety of hues: green, purple, red, and maroon. The seeds are referred to as "beans," although botanically they are not. Visually, the beans are as diverse as the plants: no two seeds have exactly the same pattern. Castor beans are comprised mainly of fatty acids, and the rare Omega 9 *ricinoleic acid* constitutes a full 90% of those fatty acids.

Throughout history, castor oil was extensively used to light wick lamps. But this thick oil from the castor bean is so versatile that it's currently used in an amazing number of industrial products: paints, varnishes, inks, plastics, rubber, insulation, nylon, fabric dyes, brake fluid, car and jet engine lubricants, motor oil, food containers, as a fabrics and leather preservative, and even in artificial fragrances. The personal care arena also heavily relies on castor oil as a lubricant, emulsion stabilizer, surfactant, and mold inhibitor. The oil is put into skin creams, lotions, ointments and gels; shampoo and hair tonic; cosmetics (including lipstick); deodorant; and even contraception creams and jellies. Castor oil is a highly effective, soothing emollient (softening and lubricating agent) for dry skin, open sores, rashes, and burns. It's no surprise that these beans have been found in ancient Egyptian tombs dating back to 4000 BC, as even then the oil was used for skin conditions as well as to encourage the growth of healthy, glossy hair. Today, the viscous fluid from the castor bean is regarded as one of the world's most important vegetable oils.

The emollient properties of castor oil, so prized by cosmeticians and manufacturers of skin care products, provide a clue to yet even more profound uses. For thousands of years, castor oil has been used medicinally—in Africa, Egypt, China, Greece, India, Persia, Rome, and later in 17th century Europe and the United States. In the American West after the Civil War, traveling medicine folk peddled many remedies that contained castor oil. It was touted as relieving many ailments, from constipation to heartburn, and some old literature even mentions administering castor oil to induce labor during pregnancy. (We know today that the ricinoleic acid in the oil activates certain types of prostanoid receptors in the uterus, thus inducing contractions.) The clairvoyant “sleeping prophet” Edgar Cayce, who lived in the United States from 1877 to 1945, often recommended castor oil for health problems, especially if they didn't respond to other therapies. Castor oil packs were the most common way of administering the oil (see Insert on page 480, “How To Use Castor Oil”). The packs were often placed on the abdomen or over the liver and spleen. Today, a specially refined form of castor oil is even used by oncologists to deliver some drugs into cancerous tumors. (However, in my opinion this is not the optimal way to use the oil—and if castor oil were used in its more traditional manner, accompanied by other holistic protocols, the drugs would be unnecessary.)

Observational studies indicate that topical application of ricinoleic acid (RA), the main component of castor oil, exerts remarkable analgesic and anti-inflammatory effects.

—“Effect of ricinoleic acid in acute and subchronic experimental models of inflammation.”
Mediators of Inflammation, 2000

Properties of Castor Oil. Is the oil from the bean of a tropical plant truly as beneficial (and remarkable) as some people claim? It depends who you ask. Military personnel typically associate the castor plant with harm, not healing. The ground-up beans contain a carbohydrate-binding protein called *ricin*, which in minuscule amounts can kill. But the ricin is extracted from the bean meal solids, *not* the oil itself. People in the health field—whose job is to affirm life and not perpetuate death—aren't interested in causing harm to others by pelting them with castor bean extract. They treasure what the oil has to offer. One reporter writes:

Ricinoleic acid is not to be confused with ricin, a toxin made from a protein in castor seeds that, if ingested or inhaled, is fatal. In fact, the FBI cites ricin as one of the top three chemical warfare agents.

While castor beans can be lethal if ingested, castor oil itself is not poisonous. According to the *International Journal of Toxicology's Final Report on Castor Oil*, castor oil isn't contaminated by ricin, because ricin does not “partition” [seep] into the castor oil. . . . The FDA, the WHO [World Health Organization] and the Food and Agriculture Organization (FAO) all verify castor oil's safety and effectiveness.²⁸⁷

Researchers have not yet determined precisely how castor oil heals, but there is abundant clinical evidence of the oil's ability to help with an amazing variety of health conditions. Here's a partial list of benefits. Castor oil:

- ◆ Heals the digestive tract: loosens impacted material in the colon, eliminates nausea, reverses constipation, and improves intestinal assimilation of nutrients (thus allowing cellular repair to occur).
- ◆ Heals all types of skin conditions: abrasions, acne, boils, burns, cuts, cysts, fungal infections, itching (chronic or acute), moles, rashes, scar tissue, stretch marks, warts, wrinkles, and wounds (on the skin's surface and inside the internal mucous membranes, such as the mouth and vagina), due to its emollient properties as well as its ability to pull out toxins and increase blood and lymph circulation.
- ◆ Reduces lymph congestion by increasing lymph flow, thus helping the body fight all kinds of infections and toxin-related conditions, from cancer to arthritis.

How To Use Castor Oil

Castor oil is mostly used externally in packs (poultices) on the afflicted area.

Internal use should be supervised or avoided entirely for those with intestinal tract inflammation and perforations (including colitis, diverticulitis, hemorrhoids, prolapse, ulcers, and recent surgery).

Externally applied castor oil packs are safe and helpful for everything, including intestinal tract disorders. For health applications, use organic cold-pressed oil, with a light yellow color. Industrial castor oil isn't safe. Store castor oil in a clean glass bottle.

INTERNALLY: To Heal Digestive Tract and Eliminate Constipation. Take at least one hour before eating or 3–4 hours after eating.

1. If using castor oil as a laxative for constipation, take 1 teaspoon in the morning, an hour before eating. The oil can be mixed with unsweetened cranberry juice (best choice), prune juice, ginger tea, or orange juice to mask the taste, without nullifying its laxative effects. It may take 6–12 hours before a bowel movement ensues.

2. According to World Health Organization Expert Committee on Food Additives, daily castor oil intake should not exceed 0.7 mg/kg body weight, about 1 tablespoon for adults and 1 teaspoon for children.

3. If symptoms persist for more than three days, or you need to use castor oil internally for other purposes, consult a health practitioner. You can use the oil with other therapies, including external castor oil packs (see below).

Do not ingest castor oil for more than three successive days. Taking too much of the laxative oil may result in muscle cramping, nausea, and/or diarrhea (easily resolved by stopping the oil intake).

EXTERNALLY: Castor Oil Packs for All Types of Wounds, Infections, Inflammatory Conditions and Pain (including on limbs), Insect and Animal Bites, Skin Conditions, and Systemic Toxicity (over the liver/gallbladder, stomach, belly, thyroid/parathyroid, kidneys/adrenals, appendix, or other organs and glands).

To make a castor oil pack for most areas of the body:

1. Apply oil to a clean cotton or flannel rag, or a cotton ball. The cloth should be soaked but not dripping.
 2. Place rag or cotton ball onto the bare skin over the area being treated. The oil is messy and the odor and stains are difficult to remove from fabric; so use plastic to cover any areas you want to protect.
 3. Cover pack with a clean dry cloth.
 4. Put a heating pad, hot water bottle, or thick towel over the clean cloth. The heat further activates the oil.
 5. Leave the pack on for 45–60 minutes. You can also leave it on overnight.
 6. When you're done, massage the oil into the area (optional).
 7. Remove the oil with mild botanical soap and water, or with 2 tablespoons of baking soda mixed in 1 quart of water.
 8. Apply a pack 2–3 times a day for several weeks, or until the condition is resolved. Daily use will help conditions resolve much more quickly.
- ◆ You can reuse the pack, each time adding more oil to the cloth. Store in a plastic bag in refrigerator to keep it fresh.
 - ◆ For fungal infections, soak area in Epsom Salts for 10–15 minutes to accelerate healing, then apply castor oil.
 - ◆ Wash oil-soaked cloths separately from regular laundry, because the odor and stains are extremely difficult to remove from fabric and the oil odor can contaminate clothing.

To make a castor oil pack for hair regrowth (in cases of receding hairline, balding, or thinning hair), or for fungal and mite infections of the scalp:

1. Massage enough castor oil into your moderately wet head to coat the entire scalp. *Alternative recipes (because castor oil is quite thick):* (a) Add it to your regular hair conditioner. (b) Dilute it with olive, almond, or another light oil. (c) Blend 1 tablespoon or more of castor oil with 1 to 2 eggs and ¼ to ½ cup of coconut or olive oil.
2. If castor oil is applied at night, cover hair with a shower cap, leave it on until the next morning, and shampoo hair on arising. If oil is applied to wet hair during the day, leave on for an hour and then clean with shampoo.
3. This procedure can be done nightly or several nights a week. You can also dab castor oil on your eyebrows and eyelashes to thicken them.

- ◆ Eliminates free radicals with its antioxidant properties, thus protecting the body's cells.
- ◆ Increases the number of lymphocytes (a type of white blood immune cell), thus enabling the production of more antibodies that kill pathogens.
- ◆ Stimulates liver and gallbladder function, which helps improve toxin removal, alleviate allergies, eliminate gallstones, and heal liver diseases (cirrhosis, hepatitis).
- ◆ Helps detoxify the kidneys and other organs, due to its ability to draw out wastes and poisons.
- ◆ Improves circulation, which not only relieves disorders such as migraines, but speeds healing in all areas that rely on blood flow.
- ◆ Reduces inflammation, which heals injuries and either prevents or helps eliminate infection.
- ◆ Breaks up and dissolves cysts, tumors, lesions, and adhesions (probably because it can normalize tissue).
- ◆ Improves nerve function (it's believed to balance the sympathetic and parasympathetic nervous systems), thus helping to alleviate cerebral palsy, epilepsy, Multiple Sclerosis, Parkinson's disease, and other nervous system disorders.
- ◆ Relieves all kinds of pain, from injuries and sprains in joints, tendons and muscles, to the pain of cancer.
- ◆ Eliminates bacteria and accumulated chemicals, and dissolves excess sebum (a waxy, oily substance produced by the body) on the scalp.
- ◆ Dropped directly into the eye (it's safe), helps eliminate eye infections and dissolve cataracts.
- ◆ Delivers minerals, fatty acids, and other essential nutrients into the scalp—thus stimulating the production of keratin (protein that contributes to the structure of hair), which increases hair growth and repairs split ends.

How To Use Castor Oil. Unlike other ingredients, castor oil is most beneficial when it's externally used. Modern medicine primarily knows about castor oil as an effective laxative, taken internally. But a simple compress (poultice) is often so effective that the results can seem miraculous to those unversed in natural medicine, or unfamiliar with castor oil's many benefits. The poultice is simple, consisting of a clean rag or towel soaked in oil, and then placed on the affected body part. Some people put a hot water bottle or heating pad on top of the pack to ensure a more intense penetration of the oil.

Even by itself, castor oil confers remarkable healing benefits. Some of the oil's most vocal proponents include osteopath Joseph Mercola. Medical doctor William McGarey, who has employed castor oil packs in his clinical practice, was so impressed with the results that he wrote a book called *The Oil That Heals: A Physician's Successes With Castor Oil Treatments*. And medical journals are publishing data on castor oil's properties, such as the ability to relieve arthritis symptoms. Due to how castor oil physiologically affects the body, a huge number and variety of conditions respond to it. Just a few ailments not mentioned earlier are appendicitis, asthma, cancer, cellulitis, colitis, hernia, HIV, hookworm, inflammatory bowel disease, ringworm, scleroderma, and sterility.

Conditions of the reproductive organs also respond very well to castor oil treatments. A close friend developed scar tissue that encircled the entire circumference of her birth canal, not too far from the vaginal opening. The tissue was so hard, reminiscent of a rubber washer, that sexual intercourse was extremely painful for her. Doctors advised surgery to remove the tissue, but she did some research and decided to try castor oil instead. She bought a box of disposable, flexible plastic pipettes (which are normally used to transfer fluids such as essential oils from one bottle to another). After spraying the outside of a pipette with food grade hydrogen peroxide (the pipettes weren't sterile), she siphoned up as much castor oil as she could, and then released the oil into her vagina. "It was very messy, and I had to wear sanitary pads all the time for awhile," she told me. "But it was worth it. In five days I could have sex without pain, and in a month the scar tissue had shrunk and become elastic. It doesn't bother me now."

Castor oil has many applications, is inexpensive, and is simple to use. I wouldn't be without it.

Sauna Therapy

If you ever travel to Finland and are lucky enough to be invited to someone's home for a cup of tea, don't be surprised when you're asked to remove your clothes. You are not being seduced; your hosts are simply requesting your presence in the sauna. To the Finns, an enjoyable evening consists of entering a dimly lit, closed, hot, sometimes steam-filled room of at least 160°F (71.1°C), maybe even 212°F (100°C), for a nude sweat and relaxing chat. The chances of this happening are not as remote as you might think. Currently, the estimated ratio of saunas to people in Finland is one sauna for every three people.

The many different methods of body heating are based on practices that are thousands of years old. In India—where some researchers believe sauna use originated—an

Learning To Sweat

People with certain conditions, such as underactivity of the thyroid gland or Multiple Sclerosis, often have a difficult time sweating easily. For this reason, they may dislike going into the sauna: heat can build up unbearably in the body, with no outlet. But surprisingly, the proper use of a sauna can usually help a body *learn* to sweat.

The best sauna heater for such individuals focuses on a very narrow band of wavelengths in the far infrared (FIR) range, measuring from about 9 to no more than 13 microns. The most beneficial and biocompatible wavelength is 9.35 microns. This wavelength corresponds to the normal, healthy body temperature in humans of about 98.6°F (37°C). However, the 9.35 micron wavelength equals more than a healthy body temperature. It enables eggs to hatch. And it spurs the development of blood, bone, organs, glands, nerves, muscles—in other words, all life processes. Every cell and tissue in the body that's exposed to this wavelength becomes activated and strengthened, regenerated and revitalized.

The 9.35 micron wavelength in FIR saunas imparts another benefit too: temperature regulation. If the body is either too hot or too cold, the enzymes that depend on precisely calibrated environments—which include temperature—become misshapen, and don't perform correctly. This problem is severe, because every body function and part depends on enzymes: blood sugar regulation, brain and nerves, cardiovascular system, digestion, immunity, respiration, and the urinary tract, to name just a few.

Far infrared penetrates deep into the tissues, helping the body release what doesn't belong in it. This includes heavy metals such as fluoride, mercury, cadmium, and arsenic. Fluoride impairs temperature regulation, which is largely governed by the thyroid gland. Therefore, when fluoride displaces the iodine that's normally on the thyroid's receptor sites, the gland can no longer regulate body temperature properly. As a result, the enzymes that depend on a fixed temperature cannot do their job, and they become even more misshapen. Thus sauna therapy is ideal: Sweating helps release metals and other pollutants through the skin. As contaminants are released, the temperature regulation of the body improves. And as the temperature regulation improves, one's ability to sweat improves.

People who have difficulty sweating should begin at low heat and increase the temperature gradually. (Of course, it's wise to leave the sauna immediately at the first sign of discomfort or lightheadedness.) Gradually, as the myriad toxins exit through the sweat, the body will learn to sweat—even more.

Ayurvedic medicine document from 568 BC was found, recommending 14 different methods of inducing sweat. The baths of ancient Greece and Rome included steam chambers, hot baths, and cold pools. The Native American sweat lodge consisted of curved branches covered with animal skins, with large heated stones on the dirt floor in the center of the lodge. For centuries, all over the world, different peoples developed different methods of body heating in areas ranging from small cubicles of clay that held one person to huge wooden rooms that held dozens. The materials for these sweat houses have evolved through the years, but the reason for sweating has remained the same: it's cleansing to sweat. Before I discuss saunas, though, let's review how the body regulates temperature.

In a healthy individual, the body temperature should be about 98.6°F (37°C) during the day. The temperature regulating mechanism in the hypothalamus portion of the brain constantly receives feedback from nerves inside the body and at the skin's surface. The inner nerves report temperature, and the surface nerves—the skin being the mediator between the body and the external environment—report the outer temperature. If the environment gets too cold, the temperature regulating mechanism directs the body to produce heat by shivering, and the blood vessels at the skin's surface contract. This forces more warmed blood to the core of the body to protect the vital internal organs (which is why the limbs are the first to freeze during very cold temperatures).

On the other hand, when the environment is too hot and the body overheats, the temperature regulating mechanism operates differently. The blood vessels in the body and at the skin's surface dilate. This allows heat to travel from the core to the surface so it can dissipate. The blood vessel dilation also keeps the body cool by driving blood *plasma* (just the thin liquid, not the red blood cells) into the spaces between each tissue cell. At this point, the plasma is called *interstitial fluid*. The interstitial fluid then migrates to the sweat glands located deep in the skin.

There are 625 sweat glands in one square inch of skin and approximately 2.5 million sweat glands in the average person. The bottom third of a sweat gland is coiled into a ball, straightening into a single vertical channel (duct) that opens into the top layer of skin. The sweat glands absorb excess interstitial fluid, remove some of the salts (which are recycled back into the body), and then the fluid that is now called *sweat* leaves the body through the pores of the skin. (Interestingly, the fluid that we call blood plasma, interstitial fluid, lymphatic fluid, urine, and sweat are all basically the same liquid, with slight variations in the amounts of proteins, mineral salts, and toxins. We call these fluids by different names depending on their function and location in the body.)

Water evaporating from the skin can cool the body as long as the water evaporates faster than the body can produce sweat. This is why the body can't cool itself well in very humid climates: even though the air is hot, it's so saturated with moisture that it can't hold any more dampness. Hence, sweat tends not to evaporate. This is also why we don't sweat efficiently in a steam room, but do sweat more in a fairly dry sauna. Nevertheless, some moisture is necessary. Many modern sauna rooms use some water to moisten the air. The Finns and Native Americans (among others) throw water on the hot rocks that heat the sauna. This small bit of moisture helps prevent the respiratory tract from becoming too dry.

A sauna should raise the internal body temperature by at least a couple of degrees. The idea is to approximate, as much as possible, conditions resembling a fever. A fever is the body's way of combating infection by "cooking" pathogens. Most harmful microbes can't survive in temperatures over 103°F or 104°F (39.4°C or 40°C). During a fever, the body produces more biochemicals called *endorphins*, which suppress pain. More *enzymes* are also produced, which the white blood cells need to destroy pathogens. Even if body heat is less than during a fever, the nerves and tissue fibers will be more pliable. This helps explain why people feel relaxed and in less pain from sauna use.

A vital feature of sauna therapy is the elimination of toxins. Toxins released through sweating come not only from interstitial fluid, but also adipose (fat) cells. The interstitial fluid seizes the waste products of normal cell metabolism, and the fatty tissue is a huge storage area for many poisons, which tend to be fat-soluble. The fatty tissue keeps poisons out of the bloodstream and prevents them from damaging the organs and muscles. When we sweat, most of the toxins that are excreted through the skin come from the fatty tissue, which begins to break down due to the high heat. (It's wise to avoid noxious chemicals in the first place, however. See Appendix G, "Safe Substitutes for Everyday Toxic Chemicals.")

Sweating, whether from playing at sports, exercising or sauna therapy, takes the burden of processing the toxins off the lymph system, urinary tract, and especially the liver. The products of cell metabolism and chemical wastes tend to be acidic, so sweating them out may raise the pH of some body tissues, making them more alkaline. This helps explain why people feel better when they perspire more than usual.

Toxin accumulation is not limited to seriously ill people. In a Spring 2001 Public Broadcasting Service television special on the chemical industry's suppression of evidence that their own products cause cancer, newsman

Bill Moyers had his blood drawn and analyzed. Out of 150 common industrial chemicals, Moyers's blood contained over 80. The sample included alcohols, solvents, pesticides, petroleum-based synthetics, PCBs, and Persistent Organic Pollutants (POPs). Fifty years ago, there were fewer chemicals than there are today. If Moyers—who was in his sixties at the time—had those levels of pollutants in his body then, what must it be like for a young child today, whose immunity is not as strong as that of an adult? Some studies are now showing over 200 chemicals in the blood of newborns! Toxic chemicals, along with microbial die-off from rifing, make a strong case for using a sauna regularly.

The type of sauna one uses can make a difference between successful and unsuccessful detoxification. Around the early 1900s, medical doctor John Harvey

Kellogg tested three kinds of heating chambers to see which one produced the most beneficial effect. Using sophisticated devices that he invented, Kellogg measured the amount of toxins in the urine and sweat of healthy volunteers who took steamy Russian and Turkish baths, and relatively

dry sessions in the doctor's own electric light cabinet. Kellogg's unit produced more toxins in the skin and urine than did the steamy chambers. The electric light bath subjects also heated more rapidly because steam lessens the amount of sweat that can evaporate from the skin.

The heat wavelengths in Kellogg's electric light bath were largely in the far infrared (FIR) range. Today, sophisticated FIR heaters have replaced Kellogg's breakable bulbs in many sauna systems. FIR heaters use very little electricity because about 80% of the emissions travel through the air to directly heat the body. Emissions in the FIR range penetrate about an inch into the body, past the sweat glands in the skin. Contemporary doctor Dietrich Klinghardt has shown that FIR detoxifies 4.3 times faster than a hot-air sauna.

Our ability to absorb and emit FIR is related to water's ability to absorb and emit FIR. Water intrinsically resonates with these wavelengths. Its molecules become smaller, more mobile, and more easily absorbed into the tissues. Not coincidentally, these wavelengths are the ideal temperature to support life and growth. An FIR wavelength of about 9.35 microns corresponds to a temperature of 98.6°F (37°C). Someone in a weakened state—who's less likely to produce FIR in abundance—can benefit greatly from these biologically compatible wavelengths.

Earlier in the **Oxygen Therapies** section, I discussed adding ozone to sauna cabinets. There's no reason why it couldn't be combined with FIR. As long as the pores are open, the ozone can enter the body and circulate

A sauna—
the poor person's
pharmacy.

Sauna + Niacin + Exercise = Toxin Removal

In the 1970s, researchers discovered that increasingly high amounts of niacin (Vitamin B3) helps the body release lipophilic (fat-loving) toxins from lipid (fat) tissues. (The niacin must be in a form that induces a flush, *not* time-release. It must also be true niacin, not the derivative niacinamide which doesn't cause a flush.) The niacin flush is not from the vitamin itself, but from heavy metals, solvents, pesticides, and other dangerous toxins in the body. As the toxins leave, the flushing decreases and eventually disappears.

The FIR sauna should be entered three hours after the niacin is ingested—the time it takes for the vitamin to induce the release of toxins from the fat cells into the bloodstream. The body excretes the contaminants via sweating, thus bypassing the detoxification requirements of the liver and lessening the eliminative burden on the kidneys. Subjects begin with 100 mg of niacin, gradually increasing the amount in 100 mg increments when the flushing lessens. (The stomach contents should be similar each time to ensure consistent results.) Exercise, done 30 minutes before going into the sauna, moves the cardiovascular and lymphatic circulations.

Many nutritional supplements are needed. Minerals replenish the electrolytes lost through sweating. B vitamins prevent imbalances that would be caused by taking niacin alone. Activated charcoal binds with toxins in the gut and prevents them from being reabsorbed in the digestive tract and redistributed in the fatty tissues, which could cause unpleasant symptoms and more health problems.

Even after just two weeks of daily saunas with niacin, people feel rejuvenated. Some proudly display the towels that absorbed their sweat, blackened with toxins—indicating the protocol's effectiveness.

See, in Appendix A: *Sauna-Niacin Therapy Protocol*

throughout the bloodstream. It should not be used in sauna rooms, only in *cabinets*, which allow the head to stick out.

Environmentally ill or chemically sensitive people need to pay special attention to the materials comprising the sauna. Woods like cedar, even though they smell wonderful, can be allergenic for some because of their natural, terpene-rich oils. For sensitive people, better choices of sauna materials are polished stone, ceramic tile, more neutral basswood or alder, or medical grade plastic that has first been allowed to outgas at the manufacturer's.

A 20-minute sauna session with deeply penetrating heat can increase blood flow to the skin by 50% or more. A profusely sweating person can lose between 1½ and 3½ quarts of water per hour; so drink plenty of water afterward. Although proportionately more water than

minerals is excreted via sweating, some minerals can still be lost, so electrolytes should be replenished.

Medical supervision is often recommended for people with serious health conditions such as epilepsy, cardiovascular conditions, hemophilia, lupus or Multiple Sclerosis, as well as those wearing a pacemaker or implant (you don't want prolonged high heat to damage or render the devices ineffective). However, medical colleagues have told me that anyone, including pregnant women, can use the sauna with proper medical supervision. In Scandinavia, pregnant women routinely use the sauna without harm.

Most people find that 20 to 30 minutes is sufficient for a satisfying sauna session. People who are clogged with toxins may want to use the sauna every day, while others prefer using it less often. Before entering the sauna, don't eat a heavy meal. Digestion concentrates blood in the stomach region, and it's important to have sufficient blood circulating in your head to avoid feeling lightheaded. Also, as chemicals and poisons leave your system, you might feel nauseated. Taking activated charcoal with plenty of water will bind to toxins in the gut. Keep doing sauna sessions, unless there's a medical reason for you to stop.

Don't use the sauna if you're drinking alcohol, are taking prescription medicines that can interact negatively with body heating, or are using "recreational" drugs. You might pass out, or in some other way be unable to manage your environment. Sauna use is also not advised for those under excessive adrenal stress. Be aware that the body will reach a saturation point where it no longer tolerates heat. This is why, historically, many cultures have alternated hot air and hot water with cold water. If you feel faint, dizzy or uncomfortable, leave the sauna immediately. After you finish your sauna, shower to prevent the toxins that have accumulated on your skin from being reabsorbed.

Regular sauna therapy can play a vital role in any health regimen and increase the speed of healing. Hundreds of well-researched clinical studies report that people with all kinds of conditions benefit from sauna therapy: cancer, colds, fevers, gout, chemical sensitivity, infections, neurological disorders, obesity, respiratory ailments, rheumatism, skin conditions, and toxemia. Newer data shows that autistic children respond very well and become more focused, articulate, and calm. This indicates that autism is largely caused by chemical contaminants that pass the brain-blood barrier and toxify the brain.

If you are killing pathogens with Rife Therapy, herbs, or another method, adding sauna detoxification to your repertoire can radically reduce the amount of time you need to heal. For the history, theory, science, physiological benefits, optimal sauna construction, and "how to" aspects of taking saunas, see my book, *The Holistic Handbook of Sauna Therapy*.

Skin Care

The skin is the largest organ of the body. The presence of boils, eczema, and most rashes indicates too great a burden for the other channels of elimination—there's so much waste in the bloodstream that debris must exit via the skin. Often, skin problems indicate the liver's inability to completely process and neutralize toxins. Even though creams and lotions can soothe and heal the skin, we must address the internal environment that's producing enough waste to affect the skin. Waste materials are usually proteins or pieces of protein. Therefore, sometimes rashes can be eliminated by taking *protease*, an enzyme that digests proteins, on an empty stomach.

Gently stroking the skin with a natural bristle brush removes dead skin cells and stimulates the circulatory and lymph systems. From the feet, use upward strokes toward the major lymph nodes at the inner thighs. From the hands, go up to the armpit, the site of another major cluster of lymph nodes.

Fake foods clog the skin and real foods help the skin remain clear and radiant. If the liver can easily do its job of breaking down contaminants, the skin will have fewer issues. Eggs, fish, liver, meats, and sunflower and pumpkin seeds are all high in zinc, which possesses antibacterial properties and is needed to produce the natural protective oils of the skin. Fatty grass fed meats, fish, and free range eggs are also important because they provide the raw materials used by the body to make Vitamin D3.

One of the best healing agents I have found for all types of skin problems is acidic water, made by my water electrolysis unit (see the section on **Water** at the beginning of this chapter). The skin is naturally acidic, with a protective coating that acts as a barrier against bacterial and some chemical contaminants. Studies show that skin with a pH below 5.0 is healthier than skin with a pH at or above 5.0 (7.0 is neutral, and above that is alkaline). At the ideal acid pH range—between 4.0 and 4.5—the native beneficial bacterial flora remain attached to the skin. Soaps are alkaline, so rinsing and washing with acidic water can be quite healing. In Japanese hospitals, acidic water is used for people with burns.

Nobody likes to have wrinkles. However, most people under 35 years old don't think about this because their skin is balanced, containing sufficient levels of both peptides and TIMPs. *Peptides* are protein signaling molecules that tell the body to build protein-based collagen and elastin, components of normal healthy skin. *TIMPs* (short for *tissue inhibitors of metalloproteinases*) protect these skin proteins

from degrading. As long as the peptide and TIMP levels are adequate in skin, we don't wrinkle. However, starting around 35 years of age, and in skin that's repeatedly exposed to the sun, collagen formation begins to wane. This unfortunate physiological decline has spawned the multi-billion dollar skin care industry.

Typical skin creams or lotions consist of two or more oils that prevent the skin from drying. However, many products—including those found in health food stores—are loaded with parabens and other preservatives, synthetic petroleum products, solvents (to emulsify or mix the ingredients), dyes, and toxic penetration enhancers such as polyethylene glycol (see Appendix F). This is why I sometimes make my own moisturizers.

The face, with its thin skin, feels better with more lightweight oils such as almond, apricot, argan, avocado, grapeseed, light (not virgin) olive, and rose hip seed oils. Skin on the rest of the body can handle thicker shea, cocoa, and mango butters. Coconut oil is versatile and can be used anywhere, including the mucous membranes of the mouth, vagina, and anus. Jojoba, from the seed of a plant, is technically not an

oil but acts like one. It's close in composition to human *sebum*, which our oil glands secrete to protect the skin and prevent it from drying. Jojoba is absorbed well and leaves the skin feeling soft without clogging the pores, so it's often used for massage. Lanolin, also called "wool wax" or "wool fat," is oil from a sheep's skin. It resembles sebum but can be allergenic for some people. Vitamin E is often added to skin care products because it acts as a natural preservative and (even on its own, straight from a capsule) helps prevent scarring. And the gel from the inner leaf of the aloe vera plant is especially healing.

High quality facial care products, intended to restore the skin, contain peptides that induce the formation of collagen and elastin in the deeper epidermal (skin) layers. However, the lack of protease inhibitors isn't usually addressed. During aging (as well as in chronic wounds), the skin not only produces lower levels of peptides, but it also produces lower levels of protease inhibitors (TIMPs)—thus allowing abnormally high levels of protease to devour the proteins that form collagen and elastin. An ideal skin preparation would contain both the restorative peptides *and* something to do the work of the missing TIMPs that the body is no longer producing, to ensure that these peptides aren't destroyed. It's my hope that skin care companies will very soon include TIMPs in their formulas along with peptides, which will make their skin creams much more effective.

The finest clothing made
is a person's own skin, but,
of course, society demands
something more than this.

SLEEP AND REST

Sleep

Effects of Sleep Deprivation

In many parts of our tired modern world, people are urged to get a good night's sleep. However, we didn't always know about this mysterious activity that consumes (or should consume) about one-third of our lives. In 1913, a French scientist wrote the first book on the physiology of sleep. Ten years later, Dr. Nathaniel Kleitman began his work in the US. In 1953 he discovered and reported the importance and meaning of the fluttering movements intermittently made by the eyes during rapid eye movement (*REM*) sleep, which occurs when we dream. Insufficient or disrupted sleep makes people tense, irritable, cognitively impaired, unable to concentrate, unusually withdrawn or aggressive, excessively hungry or not hungry at all, physically ill, and paranoid to the point of hallucinating. The problems resulting from sleep deprivation depend on whether the phase of interrupted sleep is the dreaming REM or dreamless deep slumber cycle. However, all disruptions are serious, even over a relatively short period of time.

It's during sleep that our cells are repaired and replaced. Active and stressed parts of the body have time to recharge. The brain removes waste materials from the central nervous system. And the brain cycles into different frequency ranges that correspond not only to dreaming and body movement, but also to hormone production, kidney activity, liver detoxification, and more.

Regular sleep is crucial to the formation of new brain cells. A 2014 article in *Neurology*, "Poor sleep quality is associated with increased cortical atrophy in community-dwelling adults," showed that a lack of sleep can even cause the brain to shrink, due to nerve cell deterioration.²⁸⁸ The formation of new brain cells helps develop memory. In one study, rats deprived of sleep for 72 hours had significantly higher levels of the stress hormone corticosterone. (Elevated corticosterone levels inhibit the production of new cells in the hippocampus region of the brain, which is involved in memory formation.) Once the rats were allowed normal sleep patterns, which stabilized their corticosterone levels, it took two weeks for the body to produce enough new hippocampus cells.

Experiments show that when people learn a new skill, their performance does not improve until after they have had more than six and preferably eight hours of sleep. Without adequate sleep, . . . skills and even new factual information

may not get properly encoded into the brain's memory circuits. . . . [Between the stage of sleep occurring at the beginning of the night and early the next morning] the brain undergoes physical and chemical changes whose interaction may be what strengthens memory traces.²⁸⁹

Sleep is so important that it's commonly used for brainwashing. In the 1950s, psychiatrist Louis West was appointed "to find out why 36 of 59 United States airmen captured in Korea confessed or cooperated in charges of war crimes against the United States." The findings, stated a biographer, showed that the airmen did not become unpatriotic or cowardly. Nor did the opposing side use any drugs. By interviewing the men, Dr. West discovered that the reason for their political insurgency was "prolonged, chronic loss of sleep," which was "used to confuse, bewilder and torment our men until they were ready to confess to anything." Loss of sleep, "combined with the constant fear of harm and the total dependency on their captors, led the airmen into startling and fairly long-lasting personality changes. Dr. West's work saved the airmen from court-martial. It also demonstrated the vulnerability of people in general."²⁹⁰

Another author describes in detail how psychological techniques, combined with sleep deprivation, were used to control the airmen.

This technique uses three phases. First, the victim is kept awake in isolation and becomes disoriented and disillusioned. Second, he is questioned at length and at all hours of day and night to deepen his confusion. Third, after he has been deprived of regular meals and sleep, of companionship and reading materials, a man becomes depressed and loses his sense of personal identity. It is at this point that he is ready to accept almost any human contact, regularity, and set of political or moral convictions. By such a simple disruption of normal rhythms, many American prisoners of war were induced to sign confessions opposite to their moral and ethical beliefs.²⁹¹

The physical effects of sleep deprivation are as devastating as the mental effects. Even a few nights of broken sleep can catalyze the onset of illness. Normally at night, the pineal gland produces melatonin. Production of the hormone is reduced, or entirely halted, by both interrupted sleep and light. Melatonin is a natural anti-inflammatory agent and may be the body's most efficient scavenger of free radicals (antioxidant). Without

The best cure for insomnia is to get a lot of sleep.

—W.C. Fields,
American comedian,
actor, and writer
(1880–1946)

it, waste products accumulate, which allows pathogens to proliferate and inflammation levels to rise. A 1999 study in the *Journal of Rheumatology* showed that when the deepest levels of sleep were interrupted for as little as three consecutive nights, the subjects suffered from lowered immunity, increased inflammation, raised pain levels, and more fatigue.²⁹²

Lack of sleep also interferes with the body's ability to metabolize fat. Approximately nine hours after dinner, the body begins drawing on its stored fat, and uses it for fuel. Insufficient sleep interrupts this process. It also increases one's cravings for carbohydrates (the favored foods of late night snacking), because the appetite-stimulating hormone ghrelin increases and the satiety hormone leptin decreases. There's also an increased risk for diabetes the body's ability to clear glucose from the blood is reduced by almost half.

Disrupted sleep influences our perception of the world. People tend to focus on negative events and emotions instead of positive ones. They even *remember* negative events more than they remember positive ones. A new 2018 study, published in *Nature Communications*, is called "Sleep loss causes social withdrawal and loneliness." Not only are the brains of the sleep deprived rewired, but those in contact with them also feel more lonely!²⁹³

The effects of sleep loss are endless. Heart rate and blood pressure elevate, digestive disturbances and headaches abound, and (ironically) insomnia prevails. People who work night jobs suffer from the same difficulties as the sleep-deprived. This disruption of the body's natural rhythms affects us on all levels.

Darkness, Noise, and Electromagnetic Pollution

Two centuries ago, our ancestors didn't experience light pollution from indoor bulbs, neon signs, or street lamps after dark. They didn't suffer from noise pollution from heavily trafficked roads and electricity-run machines. Nor did they have to contend with harmful electromagnetic radiation that's routinely emitted by electrical sockets, computers, cell phones, iPads, and power plants (see Chapter 1, pages 11–16). Light, sound, and electromagnetic radiation destroy a good night's sleep.

Eliminate ambient light in your sleeping quarters. As discussed earlier, melatonin—a hormone secreted by the pineal gland that (among other functions) induces sleep—is produced during darkness. Light suppresses the pineal's melatonin (and serotonin) production, so install heavy blackout curtains in the bedroom. People who must sleep during daylight hours because they work at a night job will have more restful sleep if they use blackout curtains on their windows when they're sleeping during the day, and use full spectrum lighting when they're awake at night.

Even if you sleep in a darkened room, turning on the lights, watching TV, or using the computer after the sun sets, can negatively impact your health. To give just one example, Israeli researchers found that a marked increase of exposure to light *at night*—when people should be sleeping—significantly increases the incidence of breast cancer.

There's a debate about whether the quality of sleep when going to bed after midnight is equivalent to the quality of sleep when going to bed before midnight. Some people argue that eight hours is eight hours, and it doesn't matter when you begin the sleep cycle. I disagree. The body is regulated by an innate biological clock, and secretes hormones depending on cues from light and from the Earth's electromagnetic field. For thousands of years, the Chinese have recognized that a meridian (representing specific organs and glands) has a two-hour period when it's the most active and a two-hour period when it's the least active. For example, the adrenal glands do most of their recharging between 11:00 p.m. and 1:00 a.m. Western doctors are finally taking advantage of the body's natural energetic and hormonal fluctuations by performing surgery and dispensing medications at specific times to ensure an optimal response in their clients. It's unwise to omit the sleep cycle from this total, biorhythmic picture. My research and personal experience show me that people function better if they fall asleep before rather than after midnight, even if they receive the same amount of sleep.

Many people sleep in the same room as their TVs, computers, and phones. This is a terrible practice. If you must keep this equipment in your bedroom, unplug everything from the wall—or turn off the surge protector into which the equipment is plugged—before you go to bed. This will prevent leakage of more ambient radiation. As for your iPad and especially your cell phone, turn them off and remove them from the room entirely.

People say, "I'm going to sleep now," as if it were nothing. But it's really a bizarre activity. "For the next several hours, while the sun is gone, I'm going to become unconscious, temporarily losing command over everything I know and understand. When the sun returns, I will resume my life." . . . If you didn't know what sleep was, and you had only seen it in a science fiction movie, you would think it was weird and tell all your friends about the movie you'd seen. . . . So, next time you see someone sleeping, make believe you're in a science fiction movie. And whisper, "The creature is regenerating itself."

American comedian, author, and social commentator
(1937–2008)

Sleep-Inducing Food and Supplements

If your environment is suitably quiet, dark and free of radiation, and you still have trouble sleeping, consider magnesium. Deficiencies are common, and replenishing this mineral can make an enormous difference between a good night's sleep and not sleeping well. Almonds, pumpkin and sesame seeds, and especially leafy greens (including liquid chlorophyll, taken from the greens), are abundant in magnesium. Magnesium works synergistically with Vitamins K2 and D3, and with calcium.

People with insomnia, sleepers whose bedrooms receive too much ambient light, or those whose sleep patterns have become disrupted from jet lag or a night shift job, sometimes use melatonin. Although it's a hormone, melatonin is sold (and regulated) in the US as a nutritional supplement. Taken orally, it's quickly absorbed into the bloodstream. Many products provide 3 mg or

higher amounts, but for most people even a single milligram is too much. Overdosing on melatonin, especially on a regular basis, will overwhelm the receptor sites and the body will respond improperly and then not at all—whether it's to the body's own, or to supplemental, melatonin. In October 2001, researchers from the Massachusetts Institute of Technology reported that the optimal amount of melatonin to induce sleep in adults over 50 was about 0.3 mg—one tenth the amount of what's in a typical supplement! This small amount pertained to children as well, other researchers found. Too much melatonin can make it hard to fall asleep that same night or subsequent nights. It can cause nightmares. And it can induce grogginess the next morning. You don't want the cell's receptor sites to become numb to the hormone's effects, so start conservatively. You can open the capsule and pour a tiny amount onto your tongue. If the capsule contains a 1 mg dose, begin with one-quarter that amount. If the capsule contains more, adjust the quantity accordingly. Assuming you're taking just what you need and not more, you should feel more alert and rested the next morning. The very reasons for melatonin's success—the induction of a soporific state—explains why it should not be consumed during the day. It can also aggravate depression in susceptible people, so be careful.

Another effective sleep-inducing supplement is the amino acid L-tryptophan, which calms the brain and nervous system and is the precursor to the neurotransmitter serotonin. (A *precursor* is an ingredient that chemically combines with something else to form the substance you really want.) It's illegal for baby formulas to be sold unless they contain added tryptophan, because a

baby will not develop without it. However, in the 1990s, the FDA made it illegal to sell tryptophan supplements. Charles Walters, editor of the holistic farming journal *Acres USA*, explains that tryptophan “became a target for prohibition when Japanese scientists encoded genetically modified organisms for economic production [and put it into the supplement]. . . . The GMO product also produced a toxin . . . [that] killed around a hundred people. . . . The FDA failed to identify the reason and promptly canceled the product even when naturally produced.”²⁹⁴

The timing of the ban is suspicious. The prohibition was first instituted when Eli Lilly began selling the expensive mind-altering drug Prozac®. In 2000, when the drug's patent expired and other drug companies could sell generic versions of Prozac® for pennies (making it unprofitable for Eli Lilly to sell the original drug), the ban was lifted.

In lieu of a supplement that contains tryptophan or its precursor, some sources recommend eating a dinner of tryptophan-rich turkey or chicken. (Chicken soup would work well too, and eliminate the stress of digesting solid food before bedtime.) However, it's possible that the many other amino acids that naturally exist in protein

foods compete with the dietary tryptophan, preventing enough from crossing the blood-brain barrier to induce significant slumber. In that case, tryptophan supplements would be better. Experiment to see which works best for you. Note that even supplemental tryptophan, in whatever form you take it, might not be as available to the body unless sufficient niacin (Vitamin B3) is present.

Some herbs induce sleep. Chamomile flowers make a soothing, relaxing and tasty tea, often in conjunction with other herbs that help settle the mind and calm the nerves: valerian, hops, passion flower, and skullcap.

Large dinners can be a major impediment to getting a good night's sleep (not to mention causing weight gain), especially if you eat after 7:00 p.m. In this case, the body is being forced to work extra hard to digest food when the biological clock is giving the message to slow down and prepare for sleep. If you must munch at night, eat small amounts of carbohydrates (starches and sugars) rather than animal protein. Concentrated protein tends to keep people awake and carbohydrates tend to induce sleep. Some airline crews and passengers who cross time zones on plane trips have successfully navigated the time changes by eating meals containing mostly animal protein or mostly carbohydrates, depending on whether they wish to go to sleep extra early or remain awake and alert for longer periods of time.

Be careful about reading health books. You may die of a misprint.

—Mark Twain
American writer and satirist (1835–1910)

Proper Bedding

Don't underestimate the importance of a comfortable bed. It can make the difference between sleeping well and good health, and sleeping poorly (or not at all) and ill health. In the early 1990s, my companion and I devoted considerable effort to testing mattresses in a New York City showroom. We dragged the mattresses onto the floor (to replicate our wooden platform bed), lay down, and bounced on the mattresses (and on each other). This attracted lots of attention—it was a weekend sale, so the store was packed—but I'm glad we were willing to risk a little short-term embarrassment for long-term health benefits. We had a great night's sleep for almost 15 years, until the mattress finally wore out.

Mattress quality can vary a lot. In the United States, most mattresses are made with harmful synthetic materials doused with fire retardants and other toxic chemicals that produce foul odors from the outgassing. Synthetic foam, even if it doesn't contain heavy metals or fire retardants, outgasses. It emits minute particles into the air that have a detectable odor, and can cause headaches and severe respiratory distress including asthma. Contrast this with natural latex rubber from the rubber tree, which has a mild smell and is much safer, especially for the chemically sensitive. Even bed *frames* may emit odors if they're made from cheap particleboard, which is comprised of wood chips held together with glues and adhesives. If you purchase bedding constructed with such materials, it may take a few weeks or months for the outgassing to stop. But it may never stop. This can be an expensive mistake.

It's wise to invest in a mattress made of natural fibers without chemicals: cotton, wool, hemp, or latex rubber. Even though these materials cost more initially, you'll ultimately save money because you won't become ill from the poisonous fumes. Don't assume that the mattress isn't outgassing just because you can't smell it. When the olfactory cells are constantly barraged by odors, eventually they stop being receptive to the stimulation and become numb. You may be toxifying yourself with chemicals without realizing it.

Similarly, your pillow should also be made of natural fiber. And it should give the head and neck enough support without ruining the natural curve of the neck. As for bedding, organic cotton is always better than synthetics. It allows your skin to breathe.

Optimal Temperature

During sleep, the body's core temperature lowers slightly. Therefore, the room temperature should be lower as well, between 60° and 68°F (about 15.5° and 20°C). However, the feet should be warm. Many people wear socks to bed.

Inclined Bed Therapy (IBT)

Inclined Bed Therapy (IBT) was developed in the United Kingdom by Andrew K. Fletcher. The head of the bed is initially elevated to three or four inches, and is gradually raised to an optimum eight inches. This mode of sleeping may seem strange, but its origins are sound.

Fletcher first became interested in how we can make gravity work for us by investigating the mechanism by which trees draw water from the soil. This led to a public experiment performed before an audience that included Forestry Commission scientists and the local press. Using an open-ended tubes, two vessels, water and minerals, Fletcher showed that water travels upwards much higher than one might think—as long as it's part of a feedback loop where heavily mineralized water can flow down, and non-mineralized water can flow back up.

Any concentration of minerals suspended in water results in the production of heavier water. Heavy liquids produced in the uppermost parts of the tree . . . must fall towards the roots because of the effect of gravity. . . . [while] downward flowing pulses of heavy mineral laden sap will cause a far greater volume of a lighter, dilute solution, in adjoining tubes, to be lifted. . . . Some of [the heavy downward-flowing fluids] are used in the continuous cycle of growth [of the tree], while any remaining heavy liquids which reach the roots are re-diluted by incoming water and flow back to the leaves having become lighter, drawn up by downward flowing concentrated solutions in a continual cycle.²⁹⁵

We can apply this observation to humans. Heavily mineralized blood plasma flows down, and blood plasma that is *not* heavily mineralized flows back up. (The remarkable flow of bodily fluids very likely also relates to the electrical charge in what Gerald H. Pollack refers to as “the fourth phase of water” in his book and online lectures.) Due to the pumping action caused by the heavier mineral-laden fluid and the lighter mineral-deficient fluid, there is no stagnation of movement. However, stagnation *does* exist when the body is horizontal. By sleeping on an incline, we make gravity work for us and not against us. As Fletcher pointed out:

Baboons and other primates sleep in anything but a horizontal position in the branches of trees in order to avoid predators. Cattle and sheep, when given a choice all sleep facing uphill. Birds sleep standing in an upright position. Emperor penguins, for instance, are able to withstand the harsh conditions of Antarctica's winter as they

A Brief History of Medicine

I have an earache.

2000 B.C. – Here, eat this root.

1000 A.D. – That root is heathen.
Here, say this prayer.

1850 A.D. – That prayer is superstition.
Here, drink this potion.

1940 A.D. – That potion is unscientific.
Here, swallow this antibiotic.

2000 A.D. – That antibiotic is artificial.
Here, eat this root.

huddle together in an upright posture for several months without food. . . . The eggs, which they incubate, are maintained at a temperature near to that of our own body temperature. Clearly then, the metabolic rate that maintains our own and every other creatures body temperature is linked, in some way, to the force of gravity, but how?²⁹⁶

Once Fletcher secured the help of his family (and pets) with his inclined bed experiments, he started measuring the biochemical and physiological changes that they experienced. First, urine density was found to test highly acidic during the first morning visit to the toilet, as compared to when sleeping flat. In addition:

Measurements were taken [of heart and respiration rates] while they slept both horizontally and in the inclined position. Over several weeks, it was constantly observed that in all cases the heart rate decreased by around 10–12 beats per minute during inclined sleep, and the respiration rate decreased by 4–5 breaths per minute when compared to horizontal sleep. These measurements were later repeated and electronically confirmed by a nurse working in the Operation Recovery Room of Derriford Hospital, Plymouth. Yet the circulation, oxygen saturation and metabolism in all cases was higher in the “inclined” sleep than the horizontal or traditional sleep [position].²⁹⁷

One can imagine Fletcher’s excitement as he began to secure help from willing friends and neighbors as well, who likewise reported enormous healing benefits.

All who took part [in the inclined bed therapy experiments] experienced benefits, some being almost beyond belief. Several people have shown that it is possible to reverse damage to the central

and peripheral nervous system, including complete spinal cord injuries and nerve damage caused in chronic progressive Multiple Sclerosis, including damage to the optic nerve. Varicose veins, leg ulcers, edema, arthritic conditions, lethargy, muscle wastage (atrophy) and osteoporosis have all responded well to this therapy.

Some respond in four weeks while others may take four months or more. An improved resistance to infection has [also] been observed and I am hoping that this will enable people suffering from immune deficiency disorders to achieve a stronger resistance to seasonal viruses and bacteriological infectious organisms.²⁹⁸

Do these results sound too good to be true? Let’s hear from a source other than Fletcher himself. Australian rifer and massage therapist Ken Uzzell reported major improvements from sleeping on a slanted bed for only nine months. “I crushed my neck and lower back from an accident many years ago. Since IBT, I haven’t had any therapy or pain killers. Plus, my pelvis doesn’t go out. It’s like I never had injuries. I am close to being the fittest I have ever been.”²⁹⁹

Uzzell also observed major improvements with his massage clients who began doing IBT. All sorts of conditions improved or healed entirely: acid reflux, arthritis, back pain, edema, Multiple Sclerosis, metabolic disorders, Parkinson’s, and respiratory distress that included sleep apnea and snoring. Some of Uzzell’s clients are professional athletes. When they began using IBT, he recalls, their coaches were “staggered” by their performance increase. “I was told not to spread the word too aggressively, since after all, people like their competitive advantage.”³⁰⁰

There are sound physiological reasons for this apparently disparate list of improvements during IBT. One, with vastly improved circulation of bodily fluids (even though the heart isn’t working as hard as it does during horizontal sleep), nutrient conveyance and waste removal are more efficient. Two, the reduced compression on the spine allows the lymph tissue to move more freely and drain more easily. Three, the fascia, or membranes enveloping the muscles, unwind. “This is eight hours of low level prolonged traction that is unwinding the fascia,” Uzzell points out. “Rife Therapy unwinds the fascia as well. Relaxing the fascia is a huge boost to every system of the body.”³⁰¹ Four, the more efficient flow of both lymph and blood allows for better temperature regulation. This is why IBT subjects feel warmer during cold weather and cooler during hot weather. Five, the slant allows the entire spine to elongate. This encourages better hydration in the

spinal discs and the fluid sacks in the joints, which leads to a lessening or total elimination of back and joint pain.

The mild traction effects on the spine can produce dramatic results. “Some very nasty spinal degenerative conditions appear to be reversing without the need for surgery or drugs,” Uzzell posted on his website. “Bones actually grow longer, you will grow taller. [However, for a period of one to eight days, you will feel] initial aches in muscles as they elongate and reset.”³⁰² Note that some people feel worse before they feel better, especially if they’ve suffered from spinal injuries. However, this is a common reaction with any corrective therapy that addresses the underlying causes rather than just superficial symptoms. Fletcher wrote:

We found that the first week or so feels a little strange and some people experience a slight ache in the spine, that appears to move upwards into the neck, causing a slight stiffening; however, this soon disappears and seems to be a threshold that needs to be passed before the full benefits of this therapy are experienced. Several participants, including myself, have reported a slight increase in height, suggesting the spine is adopting a more upright posture and is probably due to a gentle easing or stretching in the spine.³⁰³

With such a marked increase in circulation and waste removal, are there any detoxification effects on the body? “You may initially get rapid detox and resulting headaches,” Uzzell advises. “But eventually, all systems in the body will respond and normalize. From my observations, physical trauma exits the body in about six weeks, and emotional trauma releases in three to four weeks.”³⁰⁴

Having known Ken for years as an honest scientist, I decided to experiment myself. Fortunately, my partner was also willing. He raised the head of our bed with cinder blocks to four inches (later upgrading the cinder blocks to wooden bed risers). We bought a sturdy wooden bed frame with a headboard, positioning the headboard at the foot of the bed to prevent both the mattress and blankets from sliding downward. After a couple of weeks of sleeping much more soundly, we decided to raise the bed to the highest recommended slant of 8 inches. To my surprise, it didn’t take long for us to get used to the slant—in fact, my body seemed to crave it. I had one fairly rough week of increased neck and back pain, accompanied by pinched nerves—I assumed that the fascia were indeed unwinding from prior injuries—but afterward, I noticed increased energy and less pain. My partner stopped snoring almost immediately, another surprise because it had been such a serious ongoing problem.

Uzzell explains the difference between standing upright and lying down with your head raised at a 5-degree slant.

Edema, swollen legs due to the breakdown of the lymph system, is resolved. It sounds as though it should be opposite, and the legs should be elevated as per doctors instructions, but I have seen the reverse to hold more value with this problem than raising the legs. When standing upright, the fluid in the legs will not be discharged, but it is [discharged] at 5 degrees.³⁰⁵

Animals like IBT as much as humans do. “I’ve tested the 5 degrees with numerous pets, cats and dogs,” Uzzell reports. “After shuffling around a little, they always choose to sleep uphill, and then they won’t move for the duration of their sleep.”³⁰⁶ This is significant because animals don’t like to be uncomfortable, and they ordinarily shift in their sleep quite a bit.

If you have a painful or degenerative spinal condition, it’s important to ease into the change of angles very gradually. Start with a two-inch incline and increase it only every few months. When you become used to the shift, this is your signal to raise the bed a bit higher. The bed can be raised with bricks, wooden wedges or blocks, or pieces of hard foam.

Inclined Bed Therapy costs almost nothing, is totally self-administered, can eliminate pain, decrease your doctor appointments, and increase the quality of your life. Because it’s not drug-related, studies on IBT will probably not appear soon in medical journals. But because it doesn’t cost much money or require great effort, consider trying it. You might be pleasantly surprised.

Rest

Rest is different from sleep, but it helps restore physical, emotional, and mental balance. The common activities of reading, watching TV, and listening to most types of music technically aren’t considered resting. Even if we enjoy these activities, very ill people, who even passively receive input from their external environment, expend energy. This can hinder the body’s ability to focus on healing because it’s preoccupied with processing information. Rest generally means lying down, in a quiet place that’s a comfortable temperature, without strident or extraneous input. Loud and particularly dissonant music is actually noise, and negatively impacts the system (see Appendix C). Among other effects, it lessens the production of enzymes and beneficial brain transmitters.

Being in a natural setting can be profoundly healing. Many people love being at a lake, on the beach, in a field or

Meditation Using the Breath

For thousands of years, Buddhist yogic masters stated that pranayama and other breathing practices enhance the ability to focus and decrease emotional reactivity. Neuroscientists have confirmed that breathing affects the levels of noradrenaline, a natural chemical produced in the brain. With too much noradrenaline we can't focus. With too little we feel sluggish and unfocused. But with optimal levels—released when we are curious, challenged, focused, emotionally aroused or have been exercising—the brain grows new connections.

By focusing on (along with sometimes regulating) the breath, we can optimize our attention level. Conversely, by focusing on our attention level, our breathing becomes more synchronized. The correct breathing meditation can promote clearer thinking and memory, more stable emotions, and overall health.

forest, or by the side of a mountain, listening to a waterfall or birds, while feeling the warmth of the sun and taking in sunlight through closed eyelids.

Even though you might appear to be “doing nothing” while you rest, your entire system is quite busy! The liver replaces all of its cells every six weeks, we grow a new skin each month, bone cells are replaced every three months, and the stomach gets a completely new lining every four days. People who are ill not only deal with the normal systemic repair and replacement of cells, but their metabolic, excretory and immune functions are working overtime. Unfortunately, in technically advanced countries such as the US, self-worth is too often equated with superior, visible achievement. So it's easy to feel that if we're not pushing frenetically to “make something of ourselves,” nothing is happening. But this isn't true; healing is a major job.

New research indicates that naps taken during the early part of the afternoon recharge the mind and body, and decrease the amount of sleep needed at night. For centuries, people in many cultures have taken afternoon siestas; and some businesses in the West are now emulating this practice. Sleeping lounges have been set up for office employees, complete with couches, pillows, blankets, and alarm clocks. Employers are discovering that the 20 or 30 minutes a worker is absent from the job to take a nap more than exponentially increases work efficiency and productivity, as well as morale.

If you cannot nap or get extra sleep, meditation may be a surprisingly good substitute. At least, it will somewhat mitigate the harm of loss of sleep. Let us explore why this possible.

MEDITATION

Until recently, meditation was regarded as esoteric—either the domain of orange-robed yogis, or practiced by ragged sages who renounce all worldly possessions and climb into a secluded cave in the Himalayas. But you don't have to join a religion or cult to meditate (or benefit from it). Some people meditate as part of their spiritual practice, others do it to release stress and relax, others do it to release stress and improve their health, and still others do it for mental and emotional clarity. I will address solely the physical, mental and emotional benefits, as spirituality is personal and subjective.

Whatever meditative technique is employed, the goal of all meditation is to increase mindfulness. *Mindfulness* may be defined as the quality of being attentive, aware, and centered or grounded in one's self. This allows one to focus on goals with equanimity and purpose—which means better managing one's emotions and overall life—instead of becoming distracted and frantic. The Greater Good Science Center at the University of California at Berkeley explains that the concept of mindfulness, which has roots in Buddhist meditation, has recently become more mainstream.

Mindfulness means maintaining a moment-by-moment awareness of our thoughts, feelings, bodily sensations, and surrounding environment, through a gentle, nurturing lens. Mindfulness also involves acceptance, meaning that we pay attention to our thoughts and feelings without judging them—without believing, for instance, that there's a “right” or “wrong” way to think or feel in a given moment. When we practice mindfulness, our thoughts tune into what we're sensing in the present moment rather than rehashing the past or imagining the future.³⁰⁷

In his comprehensive manual *Practical Meditation*, author and meditation coach Giovanni Dienstmann gives the history of many types of meditation. He explores the many physical, emotional, and mental benefits. He explains how to implement just about any practice you could imagine. And he discusses mindfulness.

Thinking is what the mind does. There isn't much you can do about that. But with meditation, you can calm this noise down. Instead of being lost in your mental chatter, imagine . . . starting your day with more calmness and clarity. You recognize thoughts or monologues as they start to surface and can choose to simply notice them and let them go, or play along with them, but

with more purpose and awareness. This is what mindfulness feels like. . . .

Imagine it is raining . . . and you have forgotten your umbrella. You feel your body tense up, and you become annoyed or upset. With mindfulness, you simply notice the rain and become aware that your body is tensing up and your mind is spinning thoughts of complaint. You don't run blindly with any of these thoughts, and you don't create layers of interpretations about them. This accepting, raw, nonjudgmental awareness is mindfulness.³⁰⁸

There are many different types of meditation. Some forms involve deliberate (and occasionally dynamic) movement, but most require a comfortable seated position with one's back straight, a compatible environment (usually quiet), and a stimulus of an auditory, visual or kinesthetic nature. To entice the brain into a tranquil, aware state, the meditator focuses either on some aspect of the environment or on some aspect of his or her internal state. An environmental focus could be a sound (such as drumming or chanting) or a visual aid (such as a candle flame or a symmetrical, geometric design called a *mandala*). The internal states on which people often focus are some form of mental imagery, an inner sound (called a *mantra*), or one's breathing (see Sidebar, "Meditation Using the Breath"). Sometimes the focus is an activity that combines the inner and outer environments, such as tea being poured in a ritualistic and mindful way: the Zen Buddhist Japanese tea ceremony. (Tai Chi, a graceful, sometimes slow series of martial arts movements, might be regarded as meditative when done in a mindful and deliberate manner.)

In many ways, meditation augments natural bodily processes that occur many times during waking hours. Alpha brain waves—which indicate (and boost) relaxation, creativity and problem-solving—are typically 7–14 cycles per second (hertz). Because the brain needs to rest, every 1½ to 2 hours people enter a prominent alpha wave brain cycle where the cognitive brain is deactivated for 10 to 20 minutes at regular intervals. When one is asleep, this brief but potent interval manifests as dreaming. When one is awake, this interval causes lapses in attention (also known as "daydreaming") that may be barely perceptible or glaringly intrusive. Most meditation techniques induce prominent alpha brain wave activity. Even one daily session can help the brain de-stress and provide needed rest—especially for people who routinely push themselves without accommodating the brain's normal physiological cycles. Effective meditative methods provide a "whole brain" experience so that more neurons fire

between the right (creative) and left (logical) hemispheres, and oscillations are better synchronized between the brain's medial frontal and lateral prefrontal cortices. This generates more rapid firing of neurotransmitters, which increases learning and problem solving abilities.

One of the most valuable meditation techniques is the Transcendental Meditation® program (commonly called "TM®" for short). The TM® technique utilizes a silently voiced mantra, consisting of a Sanskrit word of usually one or two syllables. The basic technique (not the TM-Sidhi® program, which is advanced and beyond the scope of this discussion) is done twice a day for 20 minutes each time. The person sits upright, either cross-legged or in a comfortable chair, with eyes closed, silently repeating the mantra. If other thoughts, feelings or emotions float to the surface, the person simply acknowledges them, and then resumes silently repeating the mantra.

I will describe TM® in depth because, of all the meditation techniques practiced today, this modality has probably undergone the most rigorous scientific scrutiny. To date, over 350 peer-reviewed articles have been published in more than 160 medical and scientific journals—in English, Danish, French, German, Norwegian, Portuguese, Russian, and Swedish. An estimated 85% to 90% of the journal article abstracts reviewed on the website for the National Center for Biotechnology Information (NCBI)—otherwise known as PubMed—cite measurably favorable results (as opposed to neutral or negative results) that testify to the healing properties of Transcendental Meditation®.

Consider just one study, reported in a 1987 issue of *Psychosomatic Medicine*, on the effects of TM® on the amount of medical care needed. Two thousand people across the United States who regularly practiced the Transcendental Meditation® and the (more advanced) TM-Sidhi® programs found a marked decrease in the number of medical services required over the course of five years. Their rate of overall hospitalization was an astounding 56% lower than average. When sorted into specific conditions, the figures for meditators, compared to a control group of non-meditators, were impressive. The meditators' rate of hospitalization for cardiovascular disease was 87% lower; for cancer, 55% lower; for conditions of the nervous system, 87% lower; and for nose, throat, and lung problems, 73% lower. No one could possibly rationalize these figures as statistical accidents!³⁰⁹

TM® can also profoundly affect pain levels, as studies have consistently showed. A 2006 *NeuroReport* recounted how twelve healthy, long-term meditators were matched to twelve healthy controls.³¹⁰ Using imaging techniques of the brain that highlighted its structure,

function and pharmacology, scientists found that the meditators showed a 40% to 50% lower brain response to pain. After the twelve controls were taught Transcendental Meditation® and had practiced it for only five months, their brain responses to pain also decreased by same amount. Significantly, reduced pain was not due merely to an attitudinal change or altered *perception* of pain, but to a fundamental physiological change in how the brain functions. The sympathetic nervous system—which, as part of the fight-or-flight arousal mechanism, is overactive in the majority of people—was balanced. This allowed the research subjects to experience less reactivity to distressing situations, and handle stress with more calmness and grace.

In 2012, *Circulation: Cardiovascular Quality and Outcomes* featured an article called “Stress reduction in the secondary prevention of cardiovascular disease: randomized, controlled trial of transcendental meditation and health education in Blacks.” The authors found that during an average follow-up of over five years, there was a 48% risk reduction in heart attack, stroke, and death in TM® meditators compared to non-meditating controls.³¹¹

The official Transcendental Meditation® website (tm.org) lists hundreds of articles on TM® that have appeared in respected publications—including *AIDS Care*; *Alcoholism Treatment Quarterly*; *American Journal of Hypertension*; *The American Journal of Cardiology*; *Annals of the New York Academy of Sciences*; *Bulletin on Narcotics*; *Cardiology Research and Practice*; *Cognitive Processing*; *Ethnicity and Disease*; *Integrative Cancer Therapies*; *The International Journal of the Addictions*; *The International Journal of Neuroscience*; *Journal of Alternative and Complementary Medicine*; *Journal of Applied Physiology*; *Journal of Clinical Psychology*; *Journal of the National Medical Association*; *Journal of Traumatic Stress*; *Military Medicine*; *Respiratory, Environmental and Exercise Physiology*; *Journal of Creative Behavior*; *The Journal of Clinical Psychiatry*; *Journal of Neural Transmission*; *The New Zealand Medical Journal*; *Psychophysiology*; *Psychosomatic Medicine*; *Physiology and Behavior*; *Respiration*; and *Science*. TM® has been so extensively researched, I found it difficult to choose which articles to cite. The Insert, “A Sample of Studies on the Transcendental Meditation® Technique,” features only a small number of the ones written in English (with the punctuation left intact). The list begins from the earlier to the more recent studies. (Complete citations are in the endnotes.)

**It does not matter how long
you are spending on the
Earth, how much money
you have gathered or how
much attention you have
received. It is the amount of
positive vibration you have
radiated in life that matters.**

—Amit Ray, PhD
Indian author, spiritual master,
and meditation and yoga teacher
(born 1960)

The benefits of TM® are far-reaching. Studies have shown that this technique helps meditators achieve more vitality and energy; decreased heart rate and blood pressure; decreased blood lactase levels; stronger immune function and increased resistance to infection; significant pain reduction (including improvements in headaches, migraines and backaches); a need for less sleep and improved quality of sleep; a decreased need for oxygen during sleep; better motor coordination and faster reflexes; significant reduction and elimination of addictions (including to drugs, liquor and nicotine); improvement in neurological problems including epilepsy;

and increased longevity. The mental health improvements are most impressive as well, for both adults and pre-teens. The more settled, peaceful mind reported by meditators accounts for decreased negative emotions (such as anxiety, pessimism, and depression) and increased positive emotions (including self-confidence, emotional flexibility, and self-awareness). Moreover, studies have also shown increased perceptual ability; improved stress management and reduction or

total elimination of stress (including post-traumatic stress disorder or PTSD); and even increased intelligence and better academic achievement. All of these benefits can take place in as brief a time period as 30 days.

At first glance, the improvements in physical and psychological health from Transcendental Meditation® seem almost too good to be true. How can two 20-minute meditation periods a day accomplish so much? It's not a mystery, though, if you look at the physiology behind the improvements. The primary purpose of (any) meditation is to remove stress from the system. This means calming the fight-or-flight mechanism, which forces us to react rather than respond, and awakening or augmenting the part of the brain and nervous system involved in relaxation, which allows us to respond rather than react. An example of *reacting* means behaving out of fear or anger. An example of *responding* means that we don't allow fear or anger (or any other emotion) to overwhelm us. Instead, we choose the best course of action based on reason, compassion, and cooperation. In other words, we remain calm.

The *fight-or-flight* pattern engages the *sympathetic nervous system*, the part of the autonomic or involuntary nervous system that's involved with contraction and defending ourselves from danger. This system is a throwback to the era when humans had to be vigilant and constantly watch for predators. Blood vessels constrict

and blood pressure rises. Blood flows away from the digestive organs to supply the large muscle groups so we can run from danger (presumably a large, unfriendly animal). Oxygen consumption increases (in case more is needed for running or fighting). The pupil in the eye dilates so more light enters—during which we cannot see as well, and are literally blinded by fear. Even the pH of the body changes: there's an increased secretion of acidic fluids, which dehydrate the system and can lead to illness. There is also an outpouring of cortisol, which is needed in small amounts for smooth systemic function, but which in excessive amounts causes (among other problems) inflammation, cognitive impairment, and sleep disruption. There's also an imbalance of neurotransmitters—brain chemicals that are intimately involved in how we think, feel, and engage with the world.

The *relaxation* pattern engages the *parasympathetic* nervous system, part of the autonomic or involuntary nervous system that's involved with expansion and meeting the world in a curious, open manner. Blood vessels expand and blood pressure lowers. Blood flows easily to the digestive organs if needed; a supply of extra blood is not required for running away from danger. Oxygen consumption decreases; less is required to function properly and we don't need extra for running or fighting. The pupil in the eye narrows—the opposite of the eyes being “wide with fright”—during which less light enters the eye, allowing us to see more clearly. The body doesn't have to work as hard to maintain the necessary alkaline blood pH, which automatically keeps the system hydrated and leads to better health. The adrenal hormones are secreted in the correct amounts, leading to balanced blood sugar levels, proper immune response, and the right amount of anti-inflammatory chemicals. We have the correct levels of neurotransmitters. All activity of the brain and nervous system, write the authors of *The Relaxation Response*, is:

an integrated response *opposite* to the fight-or-flight response. . . . Lowered oxygen consumption, heart rate, respiration, and blood lactate [which in excessive amounts can cause anxiety] are indicative of *decreased* activity of the sympathetic nervous system and represent a *hypometabolic*, or *restful*, state. . . . [In contrast] the physiologic changes of the fight-or-flight response are associated with *increased* sympathetic nervous system activity and represent a *hypermetabolic* [or *non-restful*] state. [emphasis added]³⁵⁰

Long-term meditation can induce startling, beneficial changes on one's physiology. Usually, starting from the third decade of life, the brain begins to deteriorate and actually shrinks in size. However, in a 2015 article published in *Frontiers in Psychology*—“Forever Young(er): potential age-defying effects of long-term meditation on gray matter atrophy”—the authors write that their findings “suggest less age-related gray matter atrophy in long-term meditation practitioners” and “add further support to the hypothesis that meditation is brain-protective and associated with a reduced age-related tissue decline.”³⁵¹ Fifty-year-olds who'd been meditating for twenty years had the same amount of gray matter as 25-year-olds.

Deepak Chopra, a physician from India trained in both allopathic and his native Ayurvedic medicine, has written many books on healing. In them, he emphasizes the importance of meditating. (First he advocated the TM® technique, and later he began teaching his own system.) In all cases, he offers the perspective of a physicist. Deep relaxation of the nervous system, Chopra explains, results in clarity of thought and “purity” of emotions. By “purity,” Chopra means *coherence*, a term used in physics.

The basic principle is like that of a laser. Normally, light is emitted as scattered, or incoherent, waves. But when light is generated in a laser, a small number of photons are aligned coherently, forming uniform waves, and their influence is enough to trigger a huge outpouring of coherence in all the other photons. The result is . . . coherent light moving in unison. Laser light is much more powerful than normal light: it can cut through steel or travel to the moon and back without losing focus.

As applied to meditation, the theory is that thoughts are also incoherent and weak in the usual waking state, but that meditation makes them more coherent by hundreds of times. (In fact, researchers have demonstrated strong brain wave coherence through TM®. . . .) By the power of coherent mental functioning, the meditators have an influence on the whole of collective consciousness, just as a few photons do for the whole laser beam. As a result, coherent awareness increases in general, and the most incoherent behavior among people—crime and war—is defeated at its source. . . . As more people meditate, the negative tendencies in society decline.³⁵²

As it turns out, there is solid science to support the claim of coherence. Chapter 6 addresses the science of thought and intention—coherence—and cites studies showing that small groups of people who practice Transcendental Meditation® affect the larger group in a beneficial way. Appendix C discusses lasers.

That said, there are other meditative techniques. Many people who practice the official TM® technique (and of course the official organization) believe that this program provides more relaxation and benefits than other methods of meditation, including Zen sitting, Hatha Yoga, autogenic training, and progressive relaxation. This claim is hotly debated. In one refutation, the *Relaxation Response* authors, citing research on TM® that began in the 1960s at Harvard Medical School, write: “There are several techniques, most of which are used as relaxation therapy, which evoke the same physiologic changes. . . . There is not a single method that is unique in eliciting the [so-called] Relaxation Response.”³⁵³ It’s true that intense relaxation is not unique to TM®. Of special interest is Natural Stress Relief® (see natural-stress-relief.com). This procedure was conceived by a former TM® teacher, who objected to the two thousand dollars it cost at that time to learn how to meditate—not to mention the many thousands of dollars that teachers had to pay to become recertified as official instructors. (Also, it’s wise to question *any* claims of “My way, technique or product is the best,” especially if those claims apparently exist to primarily reinforce the wealth, belief systems, and/or power of an individual or organization.) Natural Stress Relief® (NSR®) uses a Sanskrit syllable as a mantra, although the word is different from any that have been used in the TM® program. The website of NSR® is careful to state that their program is entirely independent of the TM® program. Researchers have studied the physiological effects of NSR®, although not as extensively as those of its predecessor. Significantly, though, NSR® is more accessible to a greater number of people. The book and CD—which come with a money-back guarantee—cost less than fifty dollars.

It’s interesting that Maharishi Mahesh Yogi, who founded the TM® technique, is reported to have stated at a 2003 press conference:

Thirty or forty thousand teachers of TM® I have trained, and many of them have gone on their own . . . They may not call it Maharishi’s TM® . . . they [may be] teaching it in some different name . . . [but it] doesn’t matter. As long as the man is getting something useful to make his life better, we are satisfied.³⁵⁴

In 2007, an interesting research paper, “The Effects of Transcendental Meditation® Compared to Other Methods of Relaxation and Meditation in Reducing Risk Factors, Morbidity, and Mortality,” asserted that quieting the mind is the most beneficial goal of meditation.

Just as it is commonly recognized that drug therapies differ in their results (and side effects), it is not unreasonable to consider that relaxation and meditation techniques may also differ in their effects. . . . Ordinarily, the mind is in an active, even agitated state, moving from thought to thought. Because concentration methods try to calm the mind by holding it on one point to prevent it from wandering, these techniques require some degree of mental effort. Because contemplation techniques utilize the meaning and significance of elevating words or phrases, they also keep the mind occupied on more active levels of thinking. Thus, both concentration and contemplation practices engage the active, thinking levels of the mind. On the other hand, the TM® technique is said to allow attention to settle from active to quieter levels. . . . The correct use of the sound [mantra] allows the ordinary thinking process to spontaneously settle to progressively quieter, more subtle levels until even the subtlest thought is transcended and a unified wholeness of awareness beyond the ordinary division between subject (knower) and object (known), termed “transcendental consciousness,” is experienced. In this completely silent self-referral state of “restful alertness,” awareness is said to be fully awake to itself alone, with no other object of thought or perception.³⁵⁵

Put more simply, striving to “do something” during meditation to achieve a particular goal may keep the mind too busy. And if the mind remains busy—immersed in the same brain wave patterns that are normally present during ordinary daily life—then meditating seems counterproductive. If, however, the meditation induces a relaxed alpha state, which means that cerebral cortex activity is bypassed (or transcended), the mind and body will be genuinely relaxed. The goal that many people (including myself) seek during meditation is to access a place of absolute stillness, sometimes referred to as “the still point within.” When one is in this place, the usual stresses of life slip away, yielding to an inner peace that is difficult to describe but is palpably felt.

Having said this—and despite my personal preference for achieving the “relaxation response” (and even transcendent states) by silently and gently repeating a mantra—not everyone enjoys this type of meditation practice. Some people achieve stillness by focusing on a combination of visual images and bodily sensations. To me, such deliberate neurological multitasking, which I regularly do in my daily life, can be exhausting. To exert a similar effort during meditation seems counterproductive to profound relaxation. However, I have a friend who practices this type of meditation. For him, a directed focus on many stimuli at the same time helps him quiet his mind. Everyone is different.

In its broadest sense, meditation might be regarded as something we are, rather than something that we do. “The most basic form of meditation,” psychologist E. Signy Knutsen writes, “is giving your full attention to whatever you are doing, be it preparing a meal, driving in your car, or simply talking to another person.” This focus may also be called *being in the present*. This is the ultimate application of being *mindful*. However, technologically advanced cultures that specialize in all types of distractions (electronics, entertainment, social media) do not encourage people to be mindful. I like to think that at some (unknown) point in Earth’s future, the entire population will naturally and organically embody what a handful of people are striving to achieve now by deliberately practicing daily meditation. Knutsen continues:

Creating a time each day for inner reflection and communion “in the moment” is one of the nicest gifts you can give yourself. When Baba Ram Dass told us to “Be Here Now” [the title of his very popular book published in the 1970s], he was describing the basic ingredient of meditation. . . . [Meditation is] an attitude rather than a technique or process. Once you’ve mastered the attitude, you’ve pretty much attained the goal of meditation, whatever form it may take.³⁵⁶

Whatever definition of meditation you prefer, de-stressing and becoming more mindful are imperative for functioning optimally in today’s world. When we become *unmindful*, our energy dissipates, and we become less efficient and less response-able.

Unfortunately, people often find it easier to be unmindful than conscious. Becoming more conscious is almost guaranteed to involve confronting painful emotions, overwhelming sensations, or negative beliefs. As long as some people can ignore these aspects of life by engaging in distracting activities such as TV, texting, video games, shopping, or addictive drugs and other substances, it’s easy to forget that “be here now” is even an issue. But being unconscious stresses the entire system. Muscles are in a constant unnecessary state of contraction, the adrenals struggle to function while being in a chronic fight-or-flight mode, and the sympathetic nervous system (an alarm state) is engaged. Moreover, breathing becomes shallow, which restricts not only the flow of oxygen and nutrients to the tissues but also heavily impedes emotional awareness. These stressors eventually create illness. They also create more unconsciousness because the stress itself is so uncomfortable—even unbearable—that the body tries to numb itself from the discomfort. Thus the cycle continues.

Around the globe, people have become so out of balance emotionally, mentally and physically, that a daily meditation session no longer seems like a luxury. It’s a necessity. If you have a life-threatening illness, if you’ve been sick for a long time, or if you simply feel run down, giving yourself time to repair and heal is essential. You have already altered your diet. You’re trying to get enough sleep. You have made good use of many of the promising therapies discussed in this chapter. So why not meditate, too, as part of your new routine? You will be giving yourself a profound form of healing whose benefits you may not yet be able to imagine. If you feel too frenzied to meditate, this may indicate how much you need it.

Frequently Asked Questions

Frequency Equipment.....

- Q. I have a radiant plasma unit.
How far from the light should I sit
or lie down? 539
- Q. Will the light from a plasma tube
hurt my eyes? 539
- Q. What if something is blocking the
light?..... 539
- Q. I have been warned about X-rays coming
from the plasma light tube. Is this a
legitimate concern? 539
- Q. Can I be harmed by the radio
frequency (RF) emitted by a device? .. 540
- Q. Different machines use different RF
carrier waves. Does it matter what the
carrier wave is? 542
- Q. I have an electrode (pad) unit. Where
should I place the electrodes? 542
- Q. Sometimes when I use the electrodes,
my skin develops a rash or blisters.
What should I do? 543
- Q. Can I use an electrode and radiant
plasma unit at the same time?..... 544
- Q. Is it true that radiant plasma devices
work better than electrode devices? ... 544
- Q. My machine doesn't allow me to program
frequencies into it. Instead, it uses code
numbers that correspond to channels
with preprogrammed frequencies. Does it
matter that I don't know what frequency
I'm getting? 545
- Q. My rife machine has a feature called
sweep. What does this do?..... 545

- Q. My rife machine has a feature called *converge*. What does this do?546
- Q. My rife machine has a feature called *gate*. What does this do?546
- Q. My rife machine has a feature called *pulse*. What does this do?547
- Q. My unit already contains some protocols. Did someone program frequencies into the unit and forget to erase them? Was I sent a used or reconditioned unit? 547
- Q. I'd like to decrease the amount of time I spend rifting. Some machines can transmit several frequencies simultaneously. Are they reliable?.....547
- Q. Do rife machines require special care? .548
- Q. Will my rife machine affect other electronic equipment?.....548
- Q. My large heavy unit, which runs on a computer, is on a metal cart so I can wheel it from room to room. When I turn it on, the display is distorted. Why?.....548
- Q. I'm nervous about runing equipment that's used for serious therapy. Aren't rife machines difficult to operate?.....559
- Q. Diagrams on the Internet explain how to build a rife machine. How hard could it be to construct my own?559
- Q. Why do manufacturers charge so much? Don't they care about people's lives?560
- Q. I'm convinced that I need to buy my own unit. Should I try to obtain a real rife machine?.....560
- Q. Some rife units in the US are approved by the FDA. Are these machines better than the ones that aren't approved?560
- Rife Sessions—When Using Any Machine ... 561***
- Q. What is a *Herxheimer* reaction? 561
- Q. What can I expect to feel during a rife session?.....562
- Q. What's the difference between a detox (Herxheimer) reaction from rifting and actually being sick? They feel similar. ...563
- Q. How do I know if I'm having a detox (Herx) reaction from rifting or if I'm feeling ill because of the RF from my unit?.....564
- Q. Why do some people feel worse immediately after having a rife session, while other people feel better?.....565
- Q. Due to a Herxheimer response, I cannot rife as often as I need to. How can I lessen or eliminate these detox reactions?566
- Q. If a temporary irregular heartbeat is one possible consequence of microbial die-off, how can this be distinguished from the medical condition known as arrhythmia?567
- Q. How many frequencies should I use per session?.....567
- Q. For how long should each frequency be administered?567
- Q. How many days should I allow between sessions?.....568
- Q. After I'm free of symptoms, for how long should I continue the sessions?.....568
- Q. I'm elderly, and very weak from being ill for so long. How should I proceed?569
- Q. Can I address more than one condition at once, or should I use my device for different conditions on alternate days? .569
- Q. Can I rife after eating or drinking?569
- Q. Should I wear special clothing for the sessions?.....569
- Q. Can I wear metal jewelry or glasses? ...569
- Q. Should there be special lighting, temperature, or moisture for either the machine or me?569
- Q. Can I run my equipment at night?.....570
- Q. With my electrode unit, do I have to feel the current in order to know that the machine is working?570
- Q. I have a serious wound that I want to treat. Can I put an electrode directly on it?570

- Q. Is it true that the metal in the electrodes can get into the body? If so, what can I do to minimize harm? 571
- Q. I use an electrode unit. How can I ensure that the signal is getting into my body? 571
- Q. Can I use WiFi while I'm using the equipment? 571
- Q. Can I do other therapies along with the rife sessions? 571
- Q. Do I need a special diet or nutritional support while rifting? 571
- Q. I'm doing many complementary therapies in addition to rife sessions. How do I know which protocol is helping me? 572
- Q. My partner is ill, and uses a radiant plasma machine daily. Will my children or I be negatively affected if we're in the same room? 572
- Q. Rifting with my radiant plasma device helped me eliminate a cold. My daughter, who also had a cold, said that she felt the signal when she was in the next room. She's no longer sick. Can the frequencies really penetrate a wall? 572
- Q. How do I use the stimulating and normalizing frequencies? 572
- Q. Does it matter which direction the light tube is facing? 572
- Q. What if I don't get any results from the frequency sessions? 573
- Q. I was getting very good results when rifting for a chronic condition until I took a two-week break. Now the same frequencies don't seem to be working. Why? 573
- Q. Can the frequencies in *The Rife Handbook* be converted into radionics rates? If not, what's the difference between rifting and radionics? 573

Frequency Selection and

***Pathogen Response* 574**

- Q. How do the frequencies work? 574
- Q. How were the frequencies in *The Rife Handbook* calculated? 575
- Q. I have a diagnosis from my doctor. How do I know which frequencies to use? 577
- Q. What if I don't have a diagnosis, and don't know which pathogens are involved in my condition? 577
- Q. Is muscle testing a valid way to figure out which frequencies will work for me? 579
- Q. Instead of individual frequencies, why can't we use all of them in succession—especially if we don't know which ones are needed? 579
- Q. Why are different frequencies sometimes listed for the same condition? And why are the same frequencies often given for two different pathogens? 579
- Q. Do higher frequencies work better than lower frequencies? 580
- Q. What are "audio range" frequencies? 580
- Q. My unit goes up to only 20,000 Hz. But my condition requires many frequencies that are over 60,000 Hz. What should I do? 580
- Q. I heard that you get better results using a higher number derived from a calculator found on the Internet. Where can I obtain this calculator? 580
- Q. Some frequencies are said to regenerate an organ or gland, rather than kill pathogens. How is this possible? And why didn't Royal Rife address this? 581
- Q. My unit has settings for different shaped waves: square, sine, and sawtooth. What's the difference between them? 582
- Q. How do I know that Rife Therapy is safe? If it kills pathogens, won't it harm me? 582

Q. Most rife units that shatter or disable pathogens under a microscope or in a Petri dish are unable to achieve the same result in live human beings. Why? Is there something wrong with the machine?.....	582	General Health	590
Q. If the frequencies are so effective, why do I need to use the machine more than once?	583	Q. Rifing relieved pain I had for decades. If the frequencies are supposed to kill pathogens, why would they work for pain?.....	590
Q. Pathogens can become resistant to antibiotics. Can they develop a similar immunity to frequencies and proliferate?	584	Q. I've been taking powerful drugs for my condition. Can I still give myself rife sessions?	590
Q. How much frequency drift is allowable for the rife equipment to still be effective in destroying pathogens?.....	584	Q. Are there any conditions that rifing can't help?	590
Q. There are some units that deliver frequencies in rapid succession, usually in the high range. Are these machines effective?.....	585	Updates on Rife Technology, Research, and Legal Issues	590
Q. Is there any other equipment that's compatible with Rife Therapy that might help me?.....	585	Q. How effective is the therapy if the machine I'm using wasn't built by Royal Rife himself? Is it possible to obtain an original Rife Ray?	590
Practitioners and Rife Therapy	586	Q. Are any of Rife's microscopes still in existence? And do they work?	590
Q. My doctor says that if Rife Therapy really worked, he'd know about it. So how can I be sure that it's effective?	586	Q. If Rife Therapy is successful, why haven't I heard about it?	590
Q. Instead of buying my own machine, shouldn't I see a doctor or qualified rife practitioner for sessions? I'm afraid I won't know what I'm doing and will hurt myself.	586	Q. Where can I find documentation of successful clinical trials showing that Rife Therapy has cured illness? And where is this technology being used today?.....	592
Q. I have a serious illness and require medical supervision. How can I find a doctor to work with while I give myself rife sessions—someone who's knowledgeable about Rife Therapy?	586	Q. Where can I find the devices you mention in this book?	593
Q. I want to try Rife Therapy before buying a unit, to see if the technology works. How can I find a health professional who has a rife machine?.....	587	Q. Why don't you discuss [a particular] machine?	593
Q. I am a health practitioner and want to use a rife machine in my office. What do I need to know?	588	Q. Why don't you, the author, manufacture or sell frequency devices?.....	594
		Q. How can I learn more about Rife Therapy?	594
		A Short Course on How to Give Yourself a Rife Session	595

All About Frequency Devices and Rife Sessions

HOW TO BEST USE THIS CHAPTER

This chapter contains all the “how-to” aspects of rifting. First, you will be told who may safely use this technology, who should not, and who may use it under certain conditions. Then you will learn about the various features of frequency equipment, how to choose a unit that’s right for you, and what to look for in a manufacturer. You will be given a crash course on how frequencies affect pathogens and the body, and how to select the correct frequencies for your condition. You will also be guided step-by-step on how to give yourself a rife session. This includes session length, duration between sessions, and how to manage the toxic waste resulting from the microbial die-off. I’ll also discuss providing rife sessions from the perspective of practitioners.

Before we continue, I want to emphasize the following points:

- ◆ *It’s essential that you read **Precautions for Using This Equipment**, next page.* As with any healing modality, there are circumstances under which you can safely use this technology, times when it is *not* safe to use it, and circumstances when you can safely use it *if you are receiving medical supervision*. If you don’t understand the limits of this technology and you don’t use it responsibly, you may not get results—or, more important, you may actively harm yourself.
- ◆ *Drink plenty of water during and after the session* (for at least 12 hours afterward), regardless of your condition or what device you are using. This may mean one or two quarts of water or possibly more. Water flushes out the toxic debris that rife sessions release. Make sure that the water contains minerals. These can be in the form of liquid electrolytes, chlorophyll, lemon juice, or something similar. Minerals in the water will help replace the minerals that your body will be using to help detoxify from, and eliminate, the debris. Do not use distilled water! See Chapter 3, **Water**, for more information.
- ◆ *Read “A Short Course on How To Give Yourself a Rife Session” at the end of this chapter.* It provides an overview of the basic protocols, general instructions on how to use the frequencies, specific guidelines for a few difficult conditions, and an additional troubleshooting section if you encounter special problems or don’t seem to be responding favorably to your frequency sessions.
- ◆ *Be aware that I am not offering medical advice.* I am reporting discoveries gleaned from reliable researchers and describing what works and why, based on accounts from experimenters worldwide. It is up to you to use your intelligence, intuition and common sense to discern what is suitable for you and what is not. *As always, if you are ill, consult with a qualified health practitioner of your choice.*

PRECAUTIONS FOR USING THIS EQUIPMENT

Be careful when experimenting with this technology. Some units are safe for people with certain conditions but not others. **Types of Frequency Devices** (immediately following) describes different types of units in detail.

If You Have a Heart Condition, But Are Not Wearing a Pacemaker

You must limit your contact with rife technology, or even avoid it entirely, depending on what type of unit you use. Continue reading for the different types of units and the conditions under which they may be used.

Electrode (Pad) Unit

Do not under any circumstance use an electrode unit that transmits the frequencies by means of an electrical current. The electrodes can be in the form of metal hand-held cylinders, flat metal plates on which you rest your bare feet, electrode patches that stick to your skin, thin metal sheets covered with a wet cloth, or metal pans of water, in which you place a part of the body. The electrical current emitted by electrodes may disrupt the beating of your heart and could even kill you. These same warnings, by the way, apply to other electrical devices that touch the body such as ultrasound machines and TENS units.

Radiant Plasma Unit

This technology is considered safe. However, your unit may come with an optional foot plate for grounding. This is similar to an electrode. *Therefore, do not use the foot plate.*

If You Are Wearing a Pacemaker for Your Heart Condition

A pacemaker is a small battery implanted under the skin on the left side, usually below the collarbone, and connected to the heart with wires. It monitors the heart rhythm. If the heart starts to beat too slowly, the pacemaker sends electrical impulses to the heart, causing it to contract. (Pacemakers have no effect on rapid heartbeats, discomfort in the chest area, or weakened heart tissue.)

In order to address frequency device safety for pacemaker wearers, I need to first briefly summarize how pacemakers operate and general safety precautions for pacemaker wearers advised by the medical profession.

The earliest pacemakers were not electronically sophisticated. Like their modern counterparts, they could malfunction from even mild electrical current that touched the body. Older pacemakers also malfunctioned when exposed to *RF frequencies* transmitted through the air. (A

certain frequency range is known as *RF*, short for “radio frequency,” because radio broadcasts are transmitted on them.) In addition, older pacemakers malfunctioned when microwaves were emitted by leaky microwave ovens. Early pacemakers were so crude that some restaurants displayed signs warning wearers that a microwave oven was being used on the premises. Even if the chances were slight that a customer’s pacemaker would be affected by microwave leakage, restaurant management understandably didn’t want to risk any negative reactions or lawsuits.

Due to these serious malfunctions, starting around the mid-1980s, pacemaker manufacturers began *shielding* the devices—covering the delicate inner circuitry with a protective coating—so the pacemakers would continue functioning even when exposed to various electromagnetic signals in the environment. Although new pacemakers are theoretically shielded, it’s possible, one manufacturing rep told me, that not all of them are—especially if they’re being used in less technologically developed countries. Older persons who received pacemaker implants years ago are also more likely to carry unshielded models.

Even though most new pacemakers *are* shielded, a new pacemaker wearer must still be cautious due to so many high-tech electronics on the market. Exposure to electromagnetic interference can affect a pacemaker’s function by readjusting its settings. Any stray electrical signal can confuse the device into registering that the heart’s electrical signals are different from what they actually are. Even a slight possibility of irregular settings requires pacemaker wearers to recognize the symptoms of pacemaker malfunction, among them dizziness and rapid heart rate. Please seek supervision of an experienced doctor who can closely monitor your pacemaker, provide follow-up evaluations, and offer immediate aid if necessary.

Every person wearing a pacemaker should receive a detailed booklet from the manufacturer stating whether or not the pacemaker is shielded, and what special protocols must be followed. Hospital personnel typically advise that people can safely use computers, copiers, electric blankets, electric tools, radar detectors, radios (AM, FM and citizen band), electric razors, televisions, and other appliances. Areas of greater concern include leaning over the idling engine of a car or against metal detectors found in airports and department stores. Areas of serious concern include nearby high-tension electric wires, high-voltage sites, and arc welding machines. Household cordless phones are safe; but the electromagnetic field from cellular phones could be a problem if the phone, while on, is held near the pacemaker (for instance, in a shirt pocket) instead of near the ear. (The dangers of most electromagnetic fields on the *body*, an entirely different issue, are discussed shortly.)

Many hospital tests and medical procedures, including radiation (for cancer), defibrillation, and electrical cauterization, should be done carefully even with a shielded pacemaker; and the device should be assessed afterwards to make sure it's working properly. Another area of concern is exposure to magnetic force fields from either magnetic resonance imaging (MRI) or other modalities that use oversized magnets. I mention this because some electromedical devices, which ordinarily are safe and effective, emit magnetic fields that disrupt pacemakers.

Clearly, with even the most modern shielded pacemaker there are risks. This is why it's so important to know about your particular pacemaker before trying rife technology.

Who among pacemaker wearers is most at risk for using a frequency device? Depending on what type of frequency device you want to use, your experimentation will be *limited or contraindicated entirely*. *Please read the information below carefully—your life may depend on it!*

Electrode (Pad) Unit

If you wear a pacemaker, do not under any circumstance use an electrode unit that transmits the frequencies by means of an electrical current! The electrodes can be in the form of metal hand-held cylinders, flat metal plates on which you rest your bare feet, electrode patches that stick to your skin, thin metal sheets covered with a wet cloth, or pans of water, in which you place a part of the body. The electrical current emitted by electrodes may not only disrupt the beating of your heart, it can also interfere with the function of the pacemaker and kill you. These are the same warnings given by manufacturers of other medical devices that touch the body, such as ultrasound machines and TENS units.

Radiant Plasma Unit With Radio Frequency

Electrode units are out of the question for a pacemaker wearer. Therefore, the only possible safe choice is a radiant plasma unit. Your first question to the company should be if the device is using RF to send the frequencies into the body, and explain why you need to know.

There are two types of radiant plasma units: those that use radio frequency (RF), and those that do not use RF. The RF is a carrier wave, which is a separate signal from the pathogen-disabling and biological frequencies that the user programs into the unit. See **Types of Frequency Devices** later in this chapter for more information on machines that use RF; but for now, here's a brief summary.

Most Rife researchers have assured me privately that radiant light units are perfectly safe—at least for those wearing shielded pacemakers—whether or not a unit is emitting RF, and whether or not a unit is touching the

body. Some RF unit manufacturers who say that the RF isn't strong enough to interfere with pacemaker function, advise sitting 6 feet away from the unit anyway, beyond the range of the RF. RF does dissipate, but how can the average layperson determine what a "safe" distance is?

A more prudent viewpoint is expressed by Rife researcher Jimmie Holman, who manufactures a radiant plasma unit that emits very high levels of power and precise wave forms without any RF. He emphasizes some important differences between radiant units that emit RF and those that do not.

Some of these light units are well constructed. But they emit enough electromagnetic interference to screw up a TV set badly. One of my earlier, experimental RF plasma tube units had some of the cleanest, lowest voltage emissions on the market—but in the wrong hands, improperly tuned, it could cause problems. Even a loose cable can be responsible for severe RF leakage. This is why I now refuse to sell such units.¹

A critical point is "properly tuned." One of my favorite frequency devices has an RF carrier wave of 27.12 MHz. A correctly working RF unit can be highly effective, but it causes problems and can even become unusable if it loses its tuning. This became clear to me on a very personal level several years ago, when two men from my local phone/Internet provider knocked on my door at seven at night. The Internet connections of many of my neighbors had been constantly interrupted over the course of two weeks, and after numerous complaints the service technicians traced the disruptive signal straight to me. Sure enough, the signal was coming from my office, where the frequency equipment was conveniently set up next to my computer. My own Internet connection had been erratic ever since I received the machine, but until the technicians showed up, I didn't know why. (Note that this was a *wired* connection that was being affected, and not WiFi.) I had to send the unit to the company for repairs.

Check with both your doctor *and* your pacemaker manufacturer to make sure your pacemaker is shielded. If it's not, you'll need to consider the pros and cons carefully. If I were wearing a pacemaker and had a terminal illness that wasn't responding to other treatments, I would use an RF unit if a non-RF unit wasn't available. Fortunately, modern pacemakers are supposed to be manufactured so that they're shielded properly.

If you wear a pacemaker and do decide to use an RF tube device: your unit may come with an optional foot plate. This is similar to an electrode. *Therefore, do not use the foot plate.*

Radiant Plasma Unit Without Radio Frequency

For pacemaker wearers, the only safe choice is plasma. Even then, you may want to use a machine that does not emit RF.

Ask the manufacturer if the device is using RF to send the frequencies into the body, and explain why you need to know. If the equipment does not utilize RF or emit any other known signal that could disrupt pacemaker function, you may freely use the machine. (Some people who are very sensitive to RF and electromagnetic fields in general may wish to use a radiant unit that doesn't use RF. This is discussed shortly.)

Regardless of what type of pacemaker you have: your unit may come with an optional foot plate. This is similar to an electrode. *Therefore, do not use the foot plate.*

Electrosmog or Electromedicine?

Not all EM fields are harmful. Briefly, the effects of EM radiation depend on:

- ◆ *Where on the EM spectrum* the wavelengths exist—in other words, *what type of wave* it is.
- ◆ The *concentration*—coherence vs. diffusion—of these wavelengths.
- ◆ The *voltage or force* with which these wavelengths interfere with bodily functions.
- ◆ *How* that radiation is being *transmitted and administered*.
- ◆ *Proximity* of the individual to the source of the field.

All of the above circumstances can literally make the difference between wellness and illness, life and death. Below are some fundamental differences between harmful and healing EM fields.

Electrosmog: Harmful EM Fields

- ◆ Signals are chaotic, sporadic, and inconsistent.
- ◆ Frequencies are in the range of living cells; combined with the chaos of the signal, they disrupt cellular function.
- ◆ Remove electrons from the body, thus supporting the propagation of free radicals.

Electromedicine: Healing EM Fields

- ◆ Signals are coherent, regular, and uniform.
- ◆ Frequencies may be in the range of living cells, but wave coherence makes them compatible with living organisms.
- ◆ Add more electrons to the body, thus helping to inhibit free radicals.

For more information, see Chapter 1 Insert, "Electromagnetic Fields and Your Health."

If You Are Wearing an Autodefibrillator

See the previous guidelines for pacemakers.

If You Are Pregnant

Nutrients that the mother ingests, chemical pollutants to which she's exposed, and the hormones she secretes, all travel through her bloodstream to the baby. So will the toxic waste from the pathogens that flood the system as a result of rifting. Because a developing fetus can't eliminate toxins as efficiently as an adult can, you may want to avoid rifting while pregnant *unless there's an emergency and/or you're consulting a doctor*. Note that this precaution applies *only* if the mother and/or fetus is ill, and whatever pathogens they harbor are being correctly targeted by the frequency equipment. If neither the mother nor child are ill, there will be nothing in the system to be killed by the frequencies, and the sessions will simply have no effect.

Electrode (Pad) Unit

The electrical current in the body may adversely affect the baby, especially if current runs through the abdomen.

Radiant Plasma Unit With Radio Frequency

The answer is *no*, for reasons similar to those given previously for pacemaker wearers.

Radiant Plasma Unit Without Radio Frequency

Rifers recommend a radiant unit lit by high voltage rather than radio frequency. See **Types of Frequency Devices** later in this chapter for details on machines that use RF.

Your unit may come with an optional foot plate for grounding. This is similar to an electrode. *Therefore, do not use the foot plate.*

If You Are Nursing

Nutrients that the mother ingests, chemical pollutants to which she is exposed, and the hormones she secretes, migrate to her milk to become part of the baby's diet. Although I have not heard any reports of babies being harmed from nursing when their mothers are using rife equipment, it's probably a good idea to avoid combining the two. *If you are nursing, there's still a way for you to give yourself rife sessions if you need them*. Express (pump out) extra breast milk before you start rifting, and refrigerate or freeze the milk. (Although freezing destroys some of the nutrients, it may be necessary to freeze the milk if you plan to rife over a long period.) This will give your baby an adequate milk supply during the period that you're

using the machine. To prevent your milk from drying up, pump your breasts as often as necessary during the rifting period, and throw away the milk because it might contain too much pathogenic waste. As soon as you feel well again, you can stop rifting and resume nursing.

If You Have Blood Clots

Electrode (Pad) Unit

Do not use contact electrodes, ever! Even small amounts of electrical current can cause some compression in the muscles, lymph and blood vessels. If you have a clot in a blood vessel that's near the electrode, and the clot breaks off into small pieces and travels through the bloodstream, it can lodge in the brain and cause a stroke.

Radiant Plasma Unit, With or Without Radio Frequency

This is safe, as the frequencies are delivered via an electromagnetic field instead of compression waves that are created by an electrode device (see above). Nevertheless, if you have a history of blood clotting or strokes and are concerned, first check with a holistic doctor, naturopath, osteopath, or other professional who's knowledgeable about Rife Therapy.

If You Are Taking Pharmaceuticals, Herbs, or Nutritional Supplements

Many electromedical devices can augment the effects of drugs or even natural substances such as herbs, vitamins and minerals. This is because the equipment causes increased electron flow in the cells—synonymous with charge or energy—resulting in heightened permeability of the cell membranes (called *electroporation*). If nutrients, herbs and medications can cross the cell membrane more easily, lower amounts are needed to do the same job.

If you are taking the prescribed dose of medication, and your tissues are now more receptive, rifting without monitoring the dose's effects may give you problems and cause effects you don't want. Even nontoxic herbs may cause undesirable effects by being more readily absorbed.

Therefore, if you're rifting while taking vitamins, minerals or herbs, monitor how you feel. If necessary, ask your practitioner to help you adjust the amounts you're taking. If you're rifting and receiving chemo for cancer, *make sure to tell your doctor so your chemo levels can be monitored and lowered if necessary!*

(Incidentally, more electron flow is also synonymous with increased oxygen. This means that the cells, instead of abnormally clumping together—common in people who are ill—are now more separate and functional.)

If You Are Wearing Metal Implants, Stents, or Breast Implants

Metal Implants

This pertains to both ferrous (which contain iron) and non-ferrous metals (such as titanium). The items may be wire mesh (screens in the abdominal area to repair hernias) or screws (used for hip replacements). You might feel warmth and tingling in the implant area, caused by the transfer of energy (called *inductive coupling* by engineers) within the metal object. Depending on the signal's wavelength, a metal implant might receive the signal because—like the DNA in biological tissue—it acts as a miniature antenna and resonates to that signal.

Metal implants could attract too much current from electrodes, but they don't react to plasma. If the area feels warm, there may be internal burning. In such cases, Jimmie Holman explains, “use different frequencies entirely or reduce the session time, possibly separating one longer session into several shorter sessions.”² Nevertheless, people with metal implants have reported safely using not only radiant plasma, but also electrode units; so it depends. Only on *very rare* occasions is rifting not possible.

Stents

A stent is a tube-like structure inserted into blood vessels or ducts to dilate them. Although stents are generally composed of wire mesh, rifers report having no problems—probably because the implant is quite small, especially compared to the wavelength. Thus the energy absorbed by the stent would be negligible. Nevertheless, be alert to possible symptoms similar to those from other types of metal implants. Stop rifting immediately and notify your doctor if you experience discomfort.

Breast Implants

No problems with any type of unit have been reported for people with silicone implants. However, silicone is quite dense, so it may be harder for the frequencies to penetrate the area. You may need to spend extra time rifting near areas containing such implants. More time may also be needed with the newer style breast implants that contain saline and are covered with silicone.

If a woman says, I am getting these breast implants to gain self confidence, then I have to ask, What kind of a society do we live in where a woman's self-confidence depends on having a dangerous, expensive and painful operation on a perfectly healthy body?

If You Are Especially Sensitive to High Levels of Concentrated Electromagnetic Radiation

Some forms of electromagnetic (EM) radiation are so harmful, they have a name: *electrosmog*, often referred to as *EMF* (short for *electromagnetic fields*, which in the popular lexicon is used to indicate detrimental characteristics). Harmful EM fields are generated by virtually all electrical appliances: air conditioners and heaters, airport scanners, washers and dryers, fans, electric shavers and hair dryers, kitchen appliances (dishwashers, blenders, mixers, electric ranges, toasters, microwave ovens and more), power tools, lights (especially those using compact fluorescent bulbs), TVs and audiovisual equipment such as stereos (including bluetooth), and vacuum cleaners. (Anything with a motor creates a magnetic field that can exert harmful effects on living organisms.) Still more items we consider indispensable to everyday living emit particularly high levels of electrosmog: computers and monitors, cell and modular phones, WiFi, and our iPads and similar devices. So-called smart meters emit particularly lethal EM radiation. (See Sidebar, “*Electrosmog or Electromedicine?*”)

The emissions from radiant light devices are usually experienced as beneficial, and adverse reactions are not too common. Sometimes rife sessions may rectify whatever is causing or contributing to your sensitivity, but being in front of most frequency devices—especially if they utilize RF (radio frequency) signals as carrier waves—may increase your sensitivity and make symptoms worse. (Devices that do and don’t use RF, and what this actually means, both technically and for your health, will be discussed shortly.) Everyone is different. If you are highly sensitive, ask detailed questions of device manufacturers to find a unit (if any) that suits your needs.

By the way, modern homeopathic remedies have been developed to help people deal with EM sensitivity, so consider consulting an experienced homeopath.

If You Cannot Adequately Eliminate the Toxic Waste Materials Released by the Rife Sessions

The importance of drinking water while rifting cannot be overemphasized. Water prevents your system from being overloaded by microbial die-off.

This technology may be less effective, and in some cases may actively harm you, if your kidneys, liver, colon, lymph system or immune functions are substantially impaired. If you don’t know whether you can handle the effects of rifting, consult with a health care provider who is knowledgeable about cleansing. You may have to build up one or more avenues of detoxification before giving yourself sessions.

If You Have an Organ Transplant and / or Are Taking Immunosuppressive Drugs

Even with the donor and recipient perfectly matched, from the perspective of the immune cells, the new lung, heart, kidney or liver is foreign and doesn’t belong. The immune cells react to the foreign tissue as they react to a pathogen: they try to eliminate it. Therefore, all organ recipients are prescribed a lifetime of immune-suppressing drugs that dampen the body’s natural immune response.

Suppressing immune cells makes one highly susceptible to infection. Thus, the frequencies can be very helpful because they disable harmful microbes much more easily than the organ recipient’s own immune cells can. Another benefit of rife sessions for organ recipients is added energy. A frequency device increases the cell’s electrical potential, or communication across the cell membranes. The body of a transplant recipient is in a delicate state, so it requires considerable energy to maintain homeostasis. However, if a frequency is used that boosts—rather than simply supports—immunity, this may overstimulate the immune cells. Hence, researchers sometimes disagree on whether rifting for organ recipients is advisable.

One manufacturer of equipment that uses a radio frequency (RF) carrier wave has organ transplant customers who report success. However, some people are negatively sensitive to RF (even if it carries healing frequencies), and the cumulative overload of electrosmog may cause, in highly stressed individuals, unwelcome reactions to the RF in a rife machine.

Experiment at your own risk, and consult a doctor.

If You Want to Give Sessions to an Infant or Young Child

Reliable statistics on the effects of rife technology on infants or older children do not exist in the US. There are good reasons for this lack of data. In the last decade, parents pursuing holistic treatments for their offspring—often at the child’s request—have been forced by government authorities to vaccinate the child; medicate the child with Ritalin® or Prozac®; or forcibly subject the sick child to chemo, radiation, surgery or other allopathic treatments under threats that the child would be removed from the home if they did not comply. It’s not surprising that many parents who give their children rife sessions don’t tell their doctors.

Therefore, with only parents’ anecdotal reports of successfully rifting their children as a guide, we must make an educated guess as to how rifting will affect a particular child, based on what we know about rifting and children’s response to illness. German naturopath Harald Sievert

writes: “In my opinion, children are far more resilient than we adults believe. This is clearly demonstrated in our therapeutic measures where children eliminate better, react quicker and produce positive results more rapidly with holistic treatment.”³ This suggests that a child will be able to handle the microbial die-off from a session.

Rifing infants should be done on a case-by-case basis, as infants are fragile. The brain and nervous system, digestive tract, reproductive organs, endocrine system, and immune function are immature and still developing.

Nonetheless, should your child ever be ill enough for you to consider a doctor’s prescription for antibiotics, this may be the time use Rife Therapy instead. Unlike drugs, rifing does not contain chemicals that poison the body. Many parents have reported success with infants as young as just a few months old.

If my infant or young child had a dangerous disease for which a doctor wanted to administer toxic drugs, I would first try Rife Therapy. A dangerously high fever—which can cause brain damage if it persists—is another problem for which Rife Therapy could be useful. However, unless the child is excessively uncomfortable or severely ill, it may be unwise to use the technology for routine and relatively mild childhood illnesses (such as the German measles). Illness stimulates the child’s system to produce antibodies (proteins that catalyze the body to defend itself against noxious foreign microbes). Once the antibodies are produced, the system’s immunity to those particular pathogens is established, and the body can better protect itself against these and other diseases in the future. Like a muscle that becomes stronger when given a moderate workout, when the immune function is “exercised,” it matures and strengthens. If not given the chance to recognize foreign microorganisms and deal with them on its own terms, the body as a whole becomes weaker and less efficient. Many holistic practitioners believe that the milder childhood illnesses can help the body through tougher times later.

Also, as Dr. Sievert points out, children and adolescents have different health issues than do adults. These include “latent susceptibility to infection, lacking in vitality, tired, poor concentration, [and] allergic stress.” He writes that children also “suffer from digestive disorders, lack of appetite and frequently exhibit deficiencies. We generally find a combination of food allergies and latent intolerances, infestation with intestinal fungi, often already at the chronic stage, with attendant dysbiosis together with post-vaccinal complications and inherited toxic stress, energetic blocks, etc.”⁴ Finally, Sievert reports, children and adolescents “increasingly display a tendency to relapse. This leads to chronic processes which may manifest themselves in long-term disturbed development. You only have to

think of the alarming rise in ADD and ADHD.”⁵ This information can be helpful in deciding which programs to use when giving your children rife sessions.

If you have any questions about the advisability of rife sessions for your child, consult with a health care provider who is supportive of holistic methods.

For a child, I believe that it’s better to use plasma than electrodes. The different types of machines are discussed in detail later in this chapter. If you are using a plasma tube device, run each frequency for the same amount of time as you would for an adult.

Anyone who rifes should drink fluids. It can be a challenge to get enough mineral-rich water into the infant to flush out toxins; so substitute liquid foods such as chicken soup, low-sugar vegetable and fruit juices, or raw milk. Even though most of these fluids are digested as food, at least some liquid will be available to help the body flush out wastes.

Should you decide to give rife sessions to your infant or child, include organ support frequencies. Consult a doctor, if necessary, to corroborate the child’s detoxification abilities. And consider gentle supplementation such as transfer factor (see Chapter 1, page 129).

If You Want to Give Sessions to a Pet, Farm Animal, or Zoo Animal

People rife their pets. Dogs and cats are the most common session recipients; but so are rabbits, hamsters, mice, and birds. Many rifers have told me that they initially bought a device for their pet; but the animal improved so much, they began using the equipment for themselves. The humans were impressed that the animals would jump on their laps or sit on the floor next to the equipment, apparently waiting to be rified. Many rifers report that pets are attracted to, and soothed by, the radiant plasma.

Some holistically inclined farmers use this technology for their cows, sheep, goats, pigs, chickens, ducks, and other animals. Veterinarians are quietly rifing animals as well, in their practices and at zoos. One vet called me to report that she used a frequency device to help a lion at a nearby zoo that was entrusted to her care. The lion improved considerably from the sessions, and with the addition of herbs, homeopathy and special foods, he soon became well. There’s also a growing market for rife machines in the show horse and race horse industry. A lot of this equipment is being used in conjunction with LED and soft laser attachments (discussed later in this chapter).

If your animal is seriously ill, consult a vet to make sure it can handle the microbial die-off from the session. Like humans, animals need to drink more when they’re being rified—otherwise, toxic waste can build up. If the

animal won't voluntarily drink more water, put more liquid into the food or give the animal liquid foods—such as chicken soup for dogs or (preferably raw) milk for cats. Some dogs will drink more when colloidal silver is put into their water dish instead of their usual water. Homemade colloidal silver, with its natural antimicrobial and cell rejuvenation properties, is an excellent adjunct to Rife Therapy. Plus, it's inexpensive to make. Don't feed colloidal silver internally to ruminant animals, however; these animals depend especially on gut bacteria for digestion. Ruminants include cattle, sheep, goats, deer, elk, camels and llamas. See Chapter 3 for more details.

TYPES OF FREQUENCY DEVICES

People often ask me, “Where can I find a rife machine?” as if there existed a single device. There are many units, made by different manufacturers, that operate on rife technology principles but all are somewhat different. A Rife machine is a serious purchase—after all, the buyer might be gravely ill—but a useful analogy can still be made to buying a refrigerator. There are different styles of refrigerators. The freezer might be on top, on the bottom, or on the side. The refrigerator may or may not have an ice maker or cold water dispenser. The temperature control dial can be in the back or on the side, and so on. Similarly, frequency units can have many fancy features or only those considered essential. Users must decide what they need.

Basic Unit Construction

Whatever style you buy, the unit will basically consist of:

- ◆ The body of the unit (usually around 1 to 3 square feet, but sometimes larger), containing a computerized *function generator*. Usually the electronic components are housed in one box; but sometimes the components may be housed in two or more different containers, either side by side or stacked on top of or next to each other. (A recent development is a very small function generator controlled by a personal computer or palm computer.)
- ◆ Built-in dials, push buttons, and/or numbered keypads to program the unit.
- ◆ Display panel, usually digital. Occasionally, the device comes with a full-size computer screen. The display shows the frequencies programmed into the machine, the time period for which the frequencies have been set, and other information.

- ◆ Frequency transmitter. This may consist of metal electrodes (in various shapes and styles), or a plasma light tube (which can be freestanding or hand-held). Sometimes a unit will have a combination of the two. Occasionally, a frequency device has LED accessories as well (discussed later in this chapter).

A good frequency device should be well made, easy to use, have a warranty with an accessible manufacturer or dealer in case the unit needs repair, and (very important) sufficiently drive the signal into the body so the frequencies can be utilized. Within these parameters, there are lots of devices on the market today that are called “rife machines.” Here is an overview of the different styles, with their advantages and disadvantages.

Mandatory Features of All Units

Effective frequency devices might do the same job, but they can be made differently and have different features. Following are the most desirable features for a frequency device.

Reliable Frequencies

It's important that what you program into the unit, what the display panel says has been programmed into the unit, and what the unit is actually emitting, are identical. Some people have specially designed test equipment to measure what frequency is coming from a machine. However, if you don't have such equipment yourself—and most people don't—you must rely on the company's word that the device is accurate. Can you trust the manufacturer's integrity? And his or her skill to build a quality unit? You might ask, “Do you test each machine to make sure it's delivering what it's supposed to? What measuring equipment do you use?”

Signal Acceptance by the Body

The goal of all equipment should be a safe signal that will penetrate the body in a way that the body will accept.

Too many people believe that more is better, bigger is better, more powerful is better. But blasting that harmful microbe with everything you've got, usually means bombarding the body; and this isn't optimal or even effective. It's understandable if rifers are tempted to blast, because people who are ill want to feel better immediately. However, *the body's receiving the signal doesn't necessarily correspond to higher power levels*. In fact, with biologically based medicine, the opposite is usually true. An excessively strong signal may be the wrong kind of output when the force of the signal is incompatible with

Signal Penetration: *Wave Shapes, Harmonics, and Duty Cycles*

One of the most common questions asked by rifers relates to signal penetration. What, besides the correct frequency, allows a signal to penetrate the cells of the body, kill pathogens, and stimulate the system's healing abilities? The answer relates to the shape of the wave, the harmonics of the frequency, and the duty cycle. I promise to make this as painless and understandable as possible. So, let's examine each in turn.

Wave Shapes. The *shape* of the wave determines whether it will penetrate the tissue. Below is a diagram of four waveforms often used in frequency devices. The most common waves are sine and square, although there are variations of these waves. Each shape has unique characteristics. (For more information about the electromagnetic spectrum, See Appendix C, "Healing with Electromedicine and Sound Therapies.")

Waveforms
(A) Sine; (B) Triangle; (C) Sawtooth; (D) Square

Please note: these shapes are not simply visual metaphors. *They are the actual wave patterns as seen on an oscilloscope* (a machine specially constructed to visually depict waveforms). *The shape is a literal indication of what the wave does and how it performs*, because each shape graphically represents the rise and fall times of the energy.

- A. Sine wave gently slopes; there is nothing angular about it.
- B. Triangle wave is pointy at the top, as though the energy were thrust or transmitted suddenly, like a knife.
- C. A sawtooth wave, which looks like the teeth of a saw, acts like a triangle wave and is similarly pointy.
- D. Square wave is very different from the other waves. It takes a very brief period for the energy to reach its maximum power level (this is called a rapid *rise time*). However, once the power is at its highest level (the horizontal line at the top), that level is maintained for a specific duration of the cycle. (One cycle is one complete wave.) The cycle is complete after the power level abruptly drops to zero and the next wave pattern begins.

Here's an analogy describing how these various wave signals perform, and how the body physically responds to them. If you put your hand on someone's back and exert a steady pressure, she will shift her weight and learn to compensate for your push. The relatively slow rise and fall times of a sine wave gives the body a chance to recognize, make adjustments for, and eventually ignore the signal. If, however, you suddenly push that person with the same amount of pressure, she will fall. The sudden thrusting quality of triangle and sawtooth waves takes the body by surprise. Similarly, the rapid rise and fall time of a square wave does not give the body a chance to compensate. However, the flat top line of a square wave means that after the body is taken by surprise, there is a relatively long period when the signal is steady. The body (and pathogens) may or may not reject the signal.

The shape of the wave is important not only because of the rise and fall times of the energy. The wave shape is also important because of the *harmonics* it produces.

Harmonics. *Harmonics* are clusters of wave patterns that are produced by the fundamental (main) frequency. *Harmonics are always higher than, and mathematically related to, the original frequency.* (*Subharmonics* are mathematically related, lower frequencies of the original number.)

Harmonics are created from the fundamental frequency similar to the way ripples are produced when you drop a pebble into a pond. The fundamental frequency is like the indentation in the water where you dropped the pebble. The water rippling out in circles is like the harmonics. Just as the ripples in the pond are *fainter* the *farther away* they are from the pebble, in harmonics the *power* that's available *decreases* the *farther away* (*higher*) they are from the main signal. Harmonics are always weaker in power than the fundamental frequency that produces them.

When you're using a signal with harmonics, the overall energy is being utilized for *both* the fundamental frequency *and* its harmonic frequencies. Therefore, the power of each individual frequency (waveform) is greatly lessened because it's sharing power with so many other waveforms.

When rifting, if you know the Mortal Oscillatory Rate (MOR) of a pathogen, you'll get better results if you focus all of the energy on a single waveform that doesn't dissipate energy on harmonics spread out across the EM spectrum. But if you're not certain of the MOR—or if the MOR is higher than what your unit can output—harmonics can be useful, as one of them may bring you close to the MOR. Scientist and machine builder Jimmie Holman hypothesizes that the harmonic output may be the reason that some modern frequency devices work better than others.

Let's examine specific waveforms to see what kinds of harmonics they are capable of creating.

- ◆ **Sine wave.** A sine wave does not contain significant harmonics. If you're absolutely sure what frequency is required to kill a pathogen (its MOR), a sine wave may be a good choice. However, pathogens mutate. And each person's body is slightly different, which can change the terrain in which a pathogen grows. Thus, the outcome is not guaranteed.

A sine wave is commonly used to regenerate tissue rather than kill pathogens.

- ◆ **Square Wave.** Of all the waveforms, the square wave is the most rich in harmonics. The harmonic frequencies of a perfectly symmetrical square wave are odd number multiples—1, 3, 5, 7, 9, 11, etc.—of the fundamental frequency. (If the square wave has a duty cycle that's lower or higher than 50%, there will be other harmonics, including even-numbered harmonics. See the next page for a discussion of duty cycle.)

If the actual MOR is known, and the equipment can deliver that frequency, a sine wave may be preferable because all power is delivered at that frequency. However, if the MOR is *not* known, and/or the unit cannot reach the higher ranges, a square wave may be the best choice because its harmonics provide a good chance of reaching the target MOR. Some of the square wave's energy is focused on the fundamental frequency, but even more energy is distributed to the harmonics. Be aware, though, that the farther away each harmonic is from the fundamental frequency, the weaker the signal becomes. Especially at the 13th harmonic and above, the signal is so faint that the MOR is no longer effective. Due to this dissipation of power, so much time per frequency might be required that sessions are no longer practical. Nevertheless, with a very few exceptions, square waves remain the favorite shape in the rifting community. Its fast rise times decrease the chances that the body will become resistant to the signal.

Most Rife researchers prefer a square wave when dealing with pathogens.

- ◆ **Triangle Wave.** The triangle wave contains some harmonics, the majority of which are clustered close to the fundamental frequency. Almost all of the wave's power is within this close cluster. (Using the analogy of the stone thrown into the pond, most of the ripples are nearest to where you threw the stone.) This can be a good choice of waveform to use if the frequency being generated lies within close range of the MOR.
- ◆ **Sawtooth.** A modified triangle wave, it's available only in specialized instruments to optimize certain effects. A sawtooth wave produces a relatively strong 2nd harmonic, and has a rapid rise and fall time. This is believed to make it quite effective against pathogens.

Duty Cycle. Some rifers believe that to achieve the highest success rate, odd harmonics should be generated with a particular *duty cycle*. A duty cycle is the ratio—expressed as a percentage—of the amount of time an *individual cycle* is *on*, compared to the amount of time it is *off*. For example, a square wave with a duty cycle of 50% is on half of the time, and off half of the time, per cycle. A square wave with a duty cycle of 60% is on 60% of the time and off the remaining 40% of the time, per cycle. And a square wave with a duty cycle of 75% is on 75% of the time and off the remaining 25% of the time, per cycle.

Note that duty cycle clips a portion of *each individual wave*, changing its shape by making it dip sharply up or down. Don't confuse it with *gating* (sometimes called by the less precise, non-engineer term *pulsing*), which briefly stops the transmission of *groups* of waves. Thus, gating allows some—but not all—of the waves through; and of the waves that do come through, only some are left intact.

Rife researchers differ as to which duty cycle gives the best results. Dr. Jeff Sutherland finds a 50% duty cycle sufficient for most organisms except *Candida albicans*, for which he uses a 10% duty cycle in a unit set to a square wave. Device manufacturer Jimmie Holman maintains that duty cycle may not be important, depending on the method of application (contact or radiant plasma), the frequencies being used, the shape of the wave, and how that wave is produced. One researcher publicizes elaborate and varied duty cycles for just about every disease. Perhaps the best guide is from Dr. Richard Loyd, who offers a basic (and apparently successful) formula that allows rifers to easily adjust duty cycle for any given situation. He raises the duty cycle the higher the frequency. Note that this is for EMEM (short for ElectroMagnetic Energy Machine) units:

- ◆ 30% for up to 6 Hz
- ◆ 50% for 7—150 Hz
- ◆ 70% for 151—440 Hz
- ◆ 75% for Hz settings higher than 440

Despite the above formula, be aware that results can vary greatly depending on the machine that's being used.

There's a lot more to rifting, and to good equipment, than is generally recognized. "As we understand better the mechanism of how our devices interact at the systemic, cellular, molecular, atomic and even subatomic levels," writes Jimmie Holman, "we can produce more effective results through selection of waveforms, circuitry and components."⁶ Both the frequencies *and* the delivery system influence the effects on the body. As we learn more about what makes rifting successful—and use different devices and frequencies—duty cycle may not play as key a role as it does now.

the more nuanced energy of living cells. *If the body does not like the signal, it will become resistant to it.* The cell membranes will literally shut down bioelectrically and biochemically, and block the signal.

For optimal results with rife equipment, the signal must be readily passed from cell to cell so the tissues are *beneficially affected* at the same time that the pathogens are being destabilized (assuming that the signal is meant to affect them). Thus, a unit with the most power is not necessarily a good investment. You want a signal that's effective, and not simply forceful. (Note that there are two categories of power: what the unit draws from an electrical outlet or batteries, and what the device transmits to the user. So when claims about a unit's power are made, you need to know which type is being addressed.)

Although signal acceptance is a simple concept—the organism either receives the frequencies or it does not—there are several factors, more than one might think, that influence whether or not this takes place. As Jimmie Holman observes, “The smallest changes to circuitry and components can dramatically affect the efficacy, operation and performance of the frequency device. Even slight manipulations of the waveform can have beneficial effects. It's the delivery system as well as the frequencies themselves that determine what the effects on the body will be.”⁷ Thus, many companies equip their devices with settings that allow the user to select from a variety of wave shapes. For the theory behind waveform selection, see the Insert beginning on page 523, “Signal Penetration: Wave Shapes, Harmonics, and Duty Cycles.” Learning the theory is not essential to operating your machine, though; you can always read it later if these details are more than you want now.

Programmable Duration

Normally, for each frequency, a unit requires between one and three minutes of *dwell time*, or the amount of time the machine stays on or focuses on a frequency. The amount of dwell time that's needed depends on the penetration power of the unit, the subject's receptivity to the signal, the degree of pathogen resistance to the signal, and the condition being treated. In general, when a difficult condition is being addressed, such as cancer, longer periods are required. It's common to linger on a single tumor-dissolving frequency for 30 minutes or more. Frequencies for pain similarly require a long period. The time needed for each frequency may vary greatly. This makes rifting not only a science, but an art.

Many Frequencies in Succession (Memory)

All professionally manufactured Rife Therapy devices allow the user to program many frequencies in succession, and then sit back while the unit delivers them. This requires building more electronics into the unit, including a memory chip. However, some rifers, wanting to save money, buy cheap machines “at cost” that require the user to manually enter each frequency. For example, you program the first frequency to run for 3 minutes, the machine stops, you program the second frequency to run for 3 minutes, the machine stops, you program the third frequency, and so on. With this system, you are focused on programming and aren't able to relax while the machine is running. I think it's worth the extra money to get a unit with memory.

Sweep Function

Holman defines sweeping with an analogy: “the shifting of frequency to either side of a central frequency, or the constant shifting of frequency between two separated frequencies, in much the same way one might envision a windshield wiper shifting back and forth to cover a larger area.”⁸ The range on either side could be 1 Hz, 10 Hz, or more. Sweeping is desirable because pathogens can mutate, and the most common number might miss its target by even just a little bit. Or, the machine operator might not be able to decide between two frequencies that are very close together. Or, there might be some frequencies fairly close together (for example, 453, 458, 465), and the subject wants to target them all, plus everything in between. The better frequency devices include a sweep feature. Later in this chapter, different types of sweeps are discussed. Some might be more effective than others, depending on the particular machine being used.

Freestanding Radiant Plasma Unit

History

The first radiant device on record (which also featured electrodes) was invented by Nikola Tesla, although Royal Rife popularized, modified, refined and promoted its use. Rife's machine was huge and heavy, expensive to build even by today's standards, and difficult to calibrate and maintain. Today's units are smaller, less expensive, and much easier to operate. The engineering is also quite different. For example, whereas Rife used tube technology (not to be confused with the tubes that contain the noble gases to create plasma), today we use transistors.

Frequency Emitting Component (Tube)

Most freestanding radiant plasma units have a single tube that rests in, on, or near the machine. Its length usually ranges from one to three feet. The tube can be cylindrical, round, or have a bulge in the middle. The tube on Royal Rife's original ray device got very hot, emitted RF, and couldn't be touched. Some freestanding plasma tubes on modern units also become hot, but others don't, depending on how the machine is constructed.

The gases inside the tube are usually argon and neon, sometimes with krypton or other gases added. One manufacturer exclusively uses argon to give the machine a greater photon emission capacity. Helium, which emits a soft purple-blue glow, is a favorite of some engineers because it conveys the desired field and is cool to the touch. Each gas possesses a different intrinsic quality. Some rifiers prefer the feeling of one particular gas over another, while other rifiers can't tell the difference.

On rare occasions, a manufacturer was known to put mercury into its tubes. Mercury is one of the most

poisonous elements on the planet. In its plasma state, mercury emits wavelengths that are readily absorbed by DNA and RNA. A tube made of quartz blocks only about 15% of the mercury emissions. This means that 85% of the emissions come through the glass. Pyrex[®] blocks about 90% to 92% of mercury emissions, while leaded glass blocks virtually all of the emissions. However, even if you are confident that the glass will remain intact, it seems foolish to use a poison as part of the frequency emission process: rifting is, after all, an energetic therapy. Ask the manufacturer what gas is used.

Power and Frequency Emission Range

As discussed in Chapter 2, Rife's very first ray units transmitted the frequencies via very powerful, high frequency signals that oscillated in the MHz (megahertz) range, hundreds of thousands of Hz. After the Federal Communications Commission outlawed the use of such high radio frequency signals by unlicensed parties, the Rife Ray design was changed. Among other modifications,

The Unique Properties of Plasma

Rife's radiant light devices utilized plasma to deliver the frequencies. But what, exactly, *is* plasma?

Plasma is often referred to as "the fourth state of matter," the other three states being the more familiar solid, liquid, and gas. Although naturally-occurring plasma does not commonly exist on Earth, it's actually the most abundant form of matter in the universe, as most stars—including our sun, which is a star—are in a plasma state.

Plasma is formed when certain gases are *ionized*. During ionization, the electrons in the outer shells of the atoms of these gases are transformed into positively and negatively charged particles called *ions*. Normally, the outer shells of the atoms in gases are already filled with the maximum number of electrons possible. This does not allow these gases to chemically combine with other elements. Therefore, when these gases become ionized, rather than combining with other elements, the only state they can achieve is to transform into another material entirely: plasma.

In order for ionization to take place, the outer-orbit electrons of the gas must be hit by *free electrons*. These free electrons can be created from several sources. Among them are intense heating, a strong electromagnetic field induced by microwaves or a laser, and a spark induced by electrical current. Rife created plasma by sending electrical current into a gas-filled tube. This current bombarded the gases with free electrons, thus ionizing the gas and transforming them into plasma. (In a plasma tube with an electrical current running through it, negatively charged particles and positively charged particles are attracted to, and collide with, each other. The collisions cause the release of *photons*. Photons possess the properties of both waves and particles, and have energy and movement, but no mass or electrical charge—and do not decay.) When the gases are excited by electrons, the plasma is "ignited."

Only certain gases called *noble gases* can be transformed into plasma. These gases are argon, helium, krypton, neon, radon, and xenon. Radiant plasma tubes used in frequency devices use either one gas, or a combination of gases. Interestingly, the atomic movement of unexcited gases is random and the emissions are incoherent. However, the atomic movement of plasma is exceptionally coherent—in a spiral.

Much of the technology that Royal Rife used in the 1930s for his frequency devices was from other scientists. On February 6, 1894, a US patent (number 0,514,170) for a plasma lamp had been issued to Nikola Tesla.

Clearly, plasma behaves very differently from gas. The charged particles that comprise plasma emit light and many other forms of electromagnetic radiation. And it's through the plasma-generated electromagnetic field that the frequencies are transmitted. If the plasma reverts to gas 24 times a second, it emits a frequency of 24 Hz. If the plasma reverts to gas 144 times a second, it emits a frequency of 144 Hz, and so on.

Rife's machine emitted harmonics in very high ranges, which targeted the pathogens as accurately as if the high-range fundamental frequency had been used. Modern researchers are working on ways to duplicate the benefits of Rife's machines without relying on such high RF. Some companies use RF carrier waves at a very low power. Alternatively, high voltage may be forced through the noble gases. Either high frequency or high voltage can excite the gas molecules inside the tube to a greater state of energy.

Regardless of what's used to light the tube, the laws of physics dictate how far the frequencies can reach. The strength of the signal exponentially decreases the farther away you are from the machine. For every 12 inches you move away from the light tube, you lose four times the power.

Some manufacturers of tube units recommend being as close to the unit as possible, and no farther away than 8 feet for maximum effectiveness. Others advise the subject to sit a minimum of 6 feet and up to 12 feet away, to eliminate any possible ill effects from the strong electromagnetic field without loss of effectiveness due to distance.

Some people can feel the effects of the frequencies even as far as 20 feet from a machine. Once, a visitor could tell that I'd recently been running my unit even though it was switched off by the time she entered the room! A residual discharge that she could sense had apparently remained.

How the Unit is Used

The user sits or lies down, or sometimes stands near the tube without touching it.

Advantages

The obvious advantage is that with the hands free, the person can read, knit, watch TV (not always the best choice), or do other things while the machine is running. (When really pressed for time, I sometimes cook dinner while my machine is on; but this way of rifting isn't optimal.) Most important, if more than one person is in the room, everyone can benefit from the therapy if they all need the same frequencies. Someone who doesn't need the frequencies that are being broadcast will not be harmed; there will simply be no effect.

Another obvious convenience is the ease of treating animals. Simply place the machine close to where they're resting. A unit that doesn't require the user's direct participation is also handy for treating small children. Ask the manufacturer how far the field extends, so the subject is close enough to the unit to receive the transmission.

Disadvantages

There's only one possible disadvantage to a radiant plasma unit that I can think of, and it affects only a few very sensitive individuals: mental and visual disorientation from the flickering light tube. The flicker occurs only when frequencies lower than 20 or 30 Hz are being emitted. At such low oscillation rates, the movement of light is slow enough to be discerned by the naked eye. However, this problem is unlikely, because the engineering in most radiant plasma units makes it difficult (if not impossible) for the machines to emit frequencies in such low ranges.

Aside from the abovementioned effects of these very low frequencies, a fair number of experimenters experience visual disturbances when the equipment is using the *gating* feature (sometimes called "pulsing," discussed later in this chapter). These disturbances can occur when the unit is transmitting any frequency. The solution is simple. If the light is flickering and it bothers you, look away, or close or cover your eyes. The frequencies work whether your eyes are open or shut.

Hand-Held Radiant Plasma Unit

History

The tubes on Royal Rife's machines got too hot to touch because of the very high-energy, high-frequency RF (radio frequency) fields. Some modern tube devices can be held because they don't utilize these exceptionally high frequency fields. If they do emit RF, it's at a low enough power level that the tubes can be touched.

Frequency Emitting Component (Tube)

A handful of device manufacturers design machines with "cold" tubes that can be either held by the user or used in radiant mode with the user sitting a few feet away. One popular model contains two 6-inch long glass cylinders embedded in plastic. The rifer holds one tube in each hand. After the unit is turned on, the plasma inside the tubes is ignited by the user's skin contact with each glass cylinder. Because the tubes are creating a circuit that the user completes, it's important that they not be allowed to touch each other. If the person lets go of the tubes, or of even one tube, the circuit will be broken and the tubes will not remain lit.

Other devices run one or more tubes of the same electrical potential, together with a grounded foot plate or water bath as the return. (There must be at least one positive and at least one negative side to complete the circuit.) Having a "ground" can greatly increase the effects of the signal because the energy is drawn to the ground instead of dissipating into the atmosphere.

Although most tubes are cylinders or balls, one company offers a spiral glass tube to be worn like a bracelet for wrist injuries such as carpal tunnel.

Gases inside the hand-held tubes are generally argon, neon and krypton. Users often mention how good the tubes feel to them (as well as comfortably warm). There are reports that some manufacturers put mercury into their tubes. Mercury is among the most poisonous elements on the planet, something to consider if the glass ever broke. But even if the glass remains intact, as this is an energetic therapy it seems unwise to use a poison as part of the frequency emission process. Ask the manufacturer what gas is used.

Power and Frequency Emission Range

Frequencies from the contact light units have a radius of several feet. Therefore, someone close by who is not touching the tubes may feel the effects.

How the Unit is Used

Although the subject usually holds the tubes, s/he can also put the cylinders someplace else on the body (under the armpit, resting on the knees), or slip the tubes inside clothing. Two people can receive equal benefit of rifting if they sit next to each other holding hands, with the free, outside hand holding one tube. Although each person is holding only one tube, their joined hands are completing the circuit, thus allowing both to be treated.

Advantages

Some people don't mind being attached to a device. A few tell me they prefer holding the cylinders instead of merely sitting in the same room with a bulb because it gives them something to do. The simple act of holding a couple of cylinders helps them feel more in control of the session—and thus their illness, because feeling in control helps stimulate immune function. Also, if there's a specific area that needs work—a localized digestive disturbance, kidney infection, or tooth abscess—it may be more beneficial to place the tubes directly on the area.

I have seen mixed results with children. One man stopped giving sessions to his 7-year-old son when the boy insisted on using the glass cylinders as drumsticks, beating out a rhythm on the back of a chair. Fortunately, the glass is sturdy and did not break. It can be unreasonable to expect a child to remain still while holding the cylinders. However, sometimes this system offers an unexpected bonus. One woman had a 10-year-old son who was very resistant to even the idea of rifting until he saw the pretty lavender plasma oscillating inside the cylindrical tubes. He was so enamored of the dancing light show whenever

a new frequency flashed through the gases, that he exclaimed, “Really cool!”—and then became quiet. He fell asleep for the remainder of the session. If a child can initially be persuaded to sit still, the frequencies usually have a calming effect and the child may go to sleep. (This also applies to grown-ups.)

Disadvantages

There are obvious limitations of having to remain stationary to ensure that you don't accidentally knock over the unit. Also, some people are bothered by the plasma moving inside the clear cylinder—although, with the hands covering most of the glass and the option of slipping the tubes inside one's clothing, this is a minor issue.

Electrode (Pad) Unit

History

The freestanding tube from Royal Rife's original invention was placed within 6 inches of the subject. John Marsh and John Crane, who later worked with Rife to adapt the technology, replaced the tube with metal electrodes that touched the body. Modern electrode units, sometimes called “pad” units, are based on this design.

Frequency Emitting Component (Electrodes)

Modern electrode devices transmit frequencies in an entirely different way than plasma light devices. Frequencies are imparted directly into the body via electrical current that flows through two wires to electrodes that touch the user's body. The electrodes can be in the form of cylinders, flat plates, or small patches that stick to the skin. Optional equipment (discussed shortly) can be used in lieu of electrodes.

Power and Frequency Emission Range

Pad units transmit frequencies only to the person touching the electrodes. Other people in the room will not feel the effects of the frequencies.

How the Unit is Used

- ◆ *Cylindrical Electrodes.* About 6 inches long, they're usually hand held but can be placed elsewhere on the body—for instance, slipped inside the waistband at opposite sides of the abdomen. According to Richard Loyd, most toxins are removed by the hand (or foot) contacting the positively-charged electrode. He found that wrapping a layer of wet paper towels around the hand cylinders helps release toxins, which otherwise could bounce off the metal and remain in the body.

- ◆ *Foot Plate Electrodes.* These are thin, flat metal sheets on which the user places his or her feet. The arch of the foot usually creates a gap between the sole of the foot and the plate. The user can increase the amount of current flowing into the foot by placing a wet cloth between the soles of the feet and the foot plates. (This will also allow toxins to exit the body.) Plain water conducts electricity, but conductivity will increase even more if salt water is used.
- ◆ *Electrode Patches.* These flat, flexible pieces come in a variety of shapes and sizes, ranging from about ½ square inch to a few square inches. A thin electrode wire leads to the piece and the entire surface conducts electricity. The patches stick to the skin and are meant to be reused until the surface is no longer sticky. A neutral electrode conductive gel, applied to the inside of the patch, extends its life and permits greater conductivity.
- ◆ *Wet Pads.* A flexible metal sheet, placed inside a wet cloth, molds to the body when strapped on with ace bandages. Wet pads are usually used on the abdomen, lower back, and under the ribs to detoxify areas such as the colon, kidneys, and liver before using other frequency programs. A session with wet pads first may allow the body to more efficiently handle the waste materials produced by the frequencies. As with the foot plates, the cloth should be wet. Salt can be dissolved in the water for greater conductivity.
- ◆ *Pan of Water.* The cords of some units lead to simple alligator clips at the end, which the user attaches to metal pans containing warm water. The user rests the feet in the pan and receives the frequencies through the water. Use filtered water to prevent heavy metals, bacteria and other contaminants from entering through the skin. If you use distilled water, adding salt is essential to provide conductivity.
- ◆ *Optional RF Signal Emitter.* With a pad unit, signal penetration may be lessened because the skin tends to dissipate some of the electrical current. To ensure greater signal penetration inside the cells, one company sells an accessory RF (radio frequency) carrier box to use with the electrodes. This allows the user-selected, “main” frequency—which matches a specific pathogen or condition—to combine with the much higher RF signal. RF ensures that the signal penetrates deeply into the body. Because the RF is emitted directly into the body without traveling through the air, no Federal Communications Commission laws are broken.

Advantages

Some people don’t mind being attached to a device. They prefer holding electrodes instead of merely sitting in the same room with a bulb because it gives them something to do. The simple act of holding cylinders helps them feel more in control of the session—and thus their illness. (Feeling in control stimulates immune function.) Also, if there’s an area that needs work—a localized digestive disturbance, kidney infection, liver pain, tooth abscess—it can be beneficial to place the tubes directly on the area.

Electrodes have another advantage. When they contact an acupuncture point at the skin’s surface, energy appears to be transmitted to the entire acupuncture meridian associated with that point. Simply holding the electrodes in the hands can affect major organs, glands and systems, even those deep in the body. Users familiar with Chinese medicine can be highly effective with creative electrode placement.

Disadvantages

Electrodes devices restrict mobility, and some people are concerned about accidentally dropping the unit if they move suddenly. Perhaps the greatest disadvantage is the electrical current itself. Even at low levels, with some people the current stings, itches, or elicits a skin rash.

Don’t use a pad unit if you are wearing a pacemaker or have a heart condition. Sending any kind of current—whether carried by RF or not—through the body can upset the heart rhythms and seriously injure or even kill you!

Sweep-Only Units

A few machines, rather than being programmable for specific numbers, emit frequencies sequentially over a very wide range of thousands of Hz.

Earlier I explained that a sweep incorporates a (limited) number of Hz on either side of the main signal. The purpose is to catch stray or mutated pathogens whose oscillation rates vary slightly from the programmed number. A general sweep unit is not meant to target individual frequencies. But the manufacturer isn’t concerned with specific MORs. The premise is: if you don’t know which frequency to use, you might as well expose yourself to all of them.

People who don’t want to fuss with precision, frequency lists and more complex programming may find such a unit very helpful. In fact, some experimenters have successfully eradicated symptoms with this method. However, if you use this type of unit for the same amount of time that you would use a frequency-specific device, you won’t receive adequate coverage of the needed frequency from among the thousands emitted. This is why, when using a general

sweep machine, you must expose yourself to the emissions for a much longer period than when using a frequency-specific device.

Most of the higher-range general sweep frequency devices are not intended to devitalize pathogens, but to provide energy to the cells. One of many machines is the Multi-Wave Oscillator (MWO), which ranges from 750 KHz (kilohertz) to 3 MHz (megahertz), with additional harmonics up to 300 GHz (gigahertz). I'll briefly describe the MWO because other devices are based on its design.

The MWO was invented by Russian electrical engineer Georges Lakhovsky, author of the 1935 book *The Secret of Life*. Lakhovsky, observing the difference in the electrical properties of healthy cells versus unhealthy diseased cells, discovered that high frequency radio waves could energize malfunctioning cells. Each cell, due to its RNA-DNA spiral, acts as a transmitter and receiver of frequencies. A cell that's properly energized can absorb nutrients and excrete wastes more easily than non-energized cells. Be aware that the MWO and similar devices, although they use frequencies, are technically not considered "rife." Royal Rife was primarily concerned with destroying pathogens (or at least, this was what he publicized).

Frequencies on CDs, DVDs, and Home Computers

In this modern post-Rife era, some companies embed frequencies onto CDs (or DVDs) that usually can be played through an ordinary desktop computer.

An old form of frequency generation uses a PC's *internal speaker* (not the sound card, which is a built-in sound system common to most new computers and laptops). The internal PC speaker—originally designed by IBM to report the condition of the computer system by beeping—generates a beep under certain conditions. After finding that the beep can be manipulated with certain software, Rife researchers began experimenting with it for therapy.

Frequencies pressed onto a CD are played through a PC, which acts as the generator. The signal is eventually sent to a high voltage RF driver hooked up to the computer, which lights a plasma tube. Alternatively, frequencies from an internal speaker are played through a stereo audio amplifier; cables wired to the output jacks of the amplifier can be attached to hand and foot electrodes or to electrode patches.

Rife researcher and machine builder Brian McInturff advises that frequencies generated through PCs instead of equipment specifically designed for rifting are less effective because they're not as accurate. Jimmie Holman, inventor of the now discontinued "poor man's rife machine," explains why.

Coil Machines ("Doug" and Other Devices)

History

Neither Royal Rife nor his colleagues ever built coil units. In 1988, Panos Pappas invented the PAPIMI. In the 1990s, Doug MacLean developed the "Doug" Device to treat himself (successfully, he stated) for Lyme disease. With coil units, a generator attaches to a cable ending in a donut-shaped coil, which the user places on or near the body. Some units attach to external equipment that runs the frequencies. Coil machines emit a very powerful pulsed magnetic field. To output 15 Hz, the field goes on and off 15 times a second; for 200 Hz, on and off 200 times a second, etc. The safety of coil units depends partly on their power output.

Cautions

- ◆ The magnetic field from the coils can interfere with or permanently damage credit cards, hard drives, and computer-driven medical devices such as pacemakers, defibrillators, and insulin pumps.
- ◆ Coil units may cause excessive warming in areas where there are metal implants (stents, pins).
- ◆ The coils may overheat and create a fire hazard.
- ◆ Lack of safety is due to excessively high power levels in some units. The intense magnetic field has caused adverse reactions in people with heart conditions, and miscarriages in pregnant women. Consider that with magnetic resonance imaging (MRI) tests—to which coil units are sometimes compared (to assure users of safety)—the administrators of the tests are always shielded. Concerns about prolonged exposure are legitimate.
- ◆ Users may believe that they're experiencing die-off (Herxheimer) reactions when they're in fact reacting adversely to the unit. A die-off response abates as health improves, but with a constant "Herx," the unit is harming you (see pages 563–564).

Benefits for Some

The original PAPIMI, when used correctly and as designed, was very effective for promoting healing of injured joints, soft tissues, and limbs. There were also reports of cancer remissions. However, not all accounts were favorable. Similar mixed results are reported with more recent coils. However, one population that claims benefits from coils are Lyme sufferers. Because the *Borrelia* spirochete hides in the body fluids and tissues, it's difficult to treat. Lyme sufferers understandably want the extra penetration that coils provide. Nevertheless, caution is strongly advised, due to the potentially excessive strength of the magnetic field. A few plasma frequency units have the penetration power without the overload.

Electrical Terms for Non-Engineers

Voltage: The amount of electromotive pressure, or force, that's driving the signal. Measured in volts or voltage. The higher the voltage, the larger the amplitude, or height, of a wave; and the more intensely you'll feel the signal. The lower the voltage, the smaller the amplitude of the wave; and the less intensely you'll feel the signal. It's like the difference between a little wave and a huge tidal wave at the beach. The tidal wave has a much bigger amplitude (height) than the tiny wave, but both will get you wet.

Current: The number of electrons that flow across a given surface, such as a wire; rate of flow. Measured in either amps (short for amperes) or milliamps (thousandths of an ampere). Because the exact number of electrons cannot be counted, one amp is a specific, hypothetical number of electrons flowing past a point per second. The larger and/or thicker the wire, the more electrons are able to flow. In a frequency device, current is typically limited for consumer protection. Current is limited by introducing resistance into the circuit (see below).

Resistance: The amount of opposition to the electrical current. Measured in ohms. The conductor (wire) is made of materials that slow or impede this electron flow. The more resistance there is in the circuit, the less current will be available.

Capacitance: The amount of electrical charge that can be transferred between two unconnected plates. Measured in farads or microfarads (one millionth of a farad.) As a charge builds up, electrons flow from negative (–) to positive (+). The more capacitance between two plates, the more charge or current flow there will be between the plates. This is considered desirable with electrode (pad) units.

Note: Some devices, such as the Bare-Rife unit, are high current/low voltage devices and need relatively large amounts of power to operate. The tubes on these units should not be touched, other than the few seconds that might initially be needed to ignite the tube. On the other hand, PPET/P3 devices (from Pulsed Technologies) and EMEM units (often handmade by electronics technicians) are high voltage/low current, and in general they use much less power to operate. Some of the high voltage devices allow for direct contact. The low levels of current are well tolerated by the body at the frequencies used by most experimenters and researchers.

Both a PC computer speaker system and a PC sound card have deficiencies in both frequency accuracy and waveform output (although the latter can be significantly corrected). Due to hardware flaws, limitations of the circuitry clock and processor speed, and inherent mathematical constraints of the PC design itself, there will *always* be differences in the frequency you want and the frequency that is actually being generated. Sometimes this difference is within acceptable limits, but sometimes it's off by quite a bit.⁹

Although sound cards are flawed, the copious amount of fluids in the bloodstream and the bodily tissues can respond favorably to frequencies in the form of sound. Life Frequencies offers the BZtronics software that utilizes sound over headphones and speakers, with good to excellent results in many cases. Likewise, the popular FreX program, created by Australian massage therapist and rife Ken Uzzell, has many satisfied users. (See Appendix A for both listings.) Uzzell's database can be used with a home computer, audio speakers, electrodes, coil units, and even plasma technology. One enterprising woman reported transmitting the frequencies through an earbud placed at her navel. Every 20 minutes, the entire blood supply passes through a major blood vessel at the navel; so an earbud conveying one frequency covers the entire system in a single 20-minute period.

Why might sound work? I believe it's the mechanical vibrations to which the water in the body responds. Thus, this method of frequency conveyance is definitely worth trying if you're on a limited budget. However, if Rife Therapy doesn't work for you with these methods, I suggest using equipment solely designed for rife sessions. This is especially important if you have a life-threatening condition like cancer or a serious infection such as Lyme.

Combination Unit

One popular frequency device contains the basic standard features of hand and foot electrodes; but for an additional cost, users may add an RF amplifier to augment the signal, and if desired, a freestanding radiant plasma attachment. Another rife technology unit has, as standard equipment, two sets of hand-held electrodes—glass tubes containing noble gases, and the more conventional metal cylinders—along with metal foot plate electrodes. Several machines come with a variety of (optional) different color LEDs, giving users the advantages of LED technology combined with rife frequencies.

For more information about LEDs and lasers, see the next page.

Laser and LED Accessories

Within the last decade or so, some laser and LED (Light Emitting Diode) manufacturers have endowed their equipment with the ability to emit rife frequencies. Conversely, a few frequency device companies have begun offering optional LED attachments. The LEDs and lasers that I will be discussing use single-wavelength light for healing, a process called *phototherapy*.

Some rifiers discover LEDs and lasers after purchasing a frequency device, but monochromatic light therapy has existed for decades. Most of the early research and published data, spanning the late 1970s to the early 1980s, were from Russia. Later, various medical organizations and government agencies all over the world—including the National Aeronautics and Space Administration (NASA) in the US—also began using this modality. Today, phototherapy is becoming mainstream as more medical studies and research papers are published.

Most laser and LED therapies differ in some important ways, but they also share similarities. Both light technologies are based on the energetic behavior of electrons. Normally, electrons occupy a fixed place in one or more orbital rings that sequentially surround the atom's nucleus. When they become excited, electrons move faster and jump to higher orbits. When they relax and return to their original position, electrons release energy in the form of light, or photon units. The wavelength of a photon—in other words, its color—is determined by the amount of energy released when the electron drops to a lower orbit. *It is this emitted light that is harnessed in all forms of laser and LED technology.*

Lasers and LEDs can be made to produce any wavelength, and hence any color. The emission of the light (whether it's a red, green, blue or other color wavelength) is never due to colored glass, paint or pigment—it's solely the wavelength of the light itself that gives the emission its characteristic color. The wavelength is always one single frequency, so the color is known as *monochromatic*.

The most popular lasers and LEDs emit the color red, which ranges from about 630 to 670 nanometers. Some clinicians prefer a 660-nanometer wavelength, maintaining that this length wave is the easiest for the tissues to absorb. Others prefer a 630-nanometer wave, based on research published in the *Journal of Clinical Medical Laser Surgery* that bluntly states, "A wavelength of 630 nm appeared to be most commonly associated with bacterial inhibition. The findings of this study might be useful as a basis for selecting LLLT [low level laser therapy] for infected wounds."¹⁰ In this case, "bacterial inhibition" is the retardation of the growth and functioning of pathogens.

Regardless of one's favorite red wavelength, all researchers and practitioners who use red light find that it stimulates blood circulation, increases lymphatic drainage, and promotes cell metabolism. With some exceptions (explained in a moment), the light can be applied to every part of the body—skin, soft tissue, muscle, bone, brain, organs, lymphatic fluid, glands and blood. Used on an artery location, the light can improve the condition of immune white cells, T-cells and B-cells within the bloodstream so they can more efficiently disable viruses, bacteria and parasites. The reason for such a widespread benefit is that, as discovered by Dr. Tiina Karu, professor of Laser Biology and Medicine in Russia:

There are photoreceptors at the molecular-cellular level which, when triggered, activate a number of biological reactions: DNA/RNA synthesis, increased cAMP levels [cyclic adenosine monophosphate, a molecule involved in many biological processes], protein and collagen synthesis, and cellular proliferation. The result is rapid regeneration, normalization and healing of damaged cellular tissue. In essence, light is a trigger for the rearrangement of cellular metabolism.¹¹

Cell metabolism is stimulated when the light reaches photoreceptors in the mitochondria, which are the fuel burning units in each cell. The photoreceptors are able to respond to only a single wavelength of light. If different wavelengths are simultaneously applied to the tissue, the cell receives conflicting signals and cannot respond properly. A phototherapy device can be built to house a single light or many, but only one wavelength at a time should be shone on the body.

Monochromatic light also activates acupuncture points. The light maintains its integrity while radiating, so it can travel along the meridians of the body without being dispersed into the surrounding tissues. This makes it very useful for Chinese medicine treatments.

The light of LEDs and lasers can also be set so that for a duration of time at regular intervals, the beam is on, off, on, off, etc. A continuous, steady emission sedates pain, whereas *gating* the beam to go on, off, on, off (sometimes called "pulsing") stimulates healing. Gating is explained more fully later in this chapter.

Lasers and LEDs are sometimes regarded as interchangeable modalities, but their differences are important. I will explore lasers first.

Laser is an acronym for *Light Amplification by Stimulated Emission of Radiation*. The monochromatic light emitted by lasers is *coherent*. This means, from a physics standpoint, that all the peaks and valleys of the waves line up. The

waves are high at the same time, and low at the same time. In practical terms, this means that the light is *directional* and *focused*. The concentration and precision of this light allow lasers to do the work for which they are best known: penetrating an object without touching it.

There are two types of lasers, “hard” and “soft.” Most people are familiar with the so-called “hard” lasers—high-intensity, high-power instruments that are used by industry (to cut through steel and other metals), or by doctors (used during surgery to make clean cuts into the body, cauterize wounds, and remove unwanted tissue). These high-intensity lasers are legally restricted devices, for obvious reasons.

True “soft” lasers—which are low-intensity and low-power, sometimes also called “cold” lasers—emit less power (under 50 milliwatts) than their restricted high-intensity counterparts. (Some lasers that are over 50 milliwatts in power are also confusingly called “soft.” However, this increase in power means that they can heat and damage tissue. So, despite the unregulated and misleading use of the word “soft” to describe these devices, I am not including them in this discussion of true “soft” lasers.) The cellular healing therapy described earlier that uses genuine “soft” lasers is also known as *low-level laser therapy*, or LLLT. Sometimes these “soft” lasers are used for acupuncture treatments instead of needles. With a little practice, they can be employed safely and effectively for healing by practitioners and knowledgeable laypersons. Keep in mind, though, that with any laser—be it “hot” or “cold”—care must be taken to avoid shining the beam directly into the eyes or even on the closed eyelid, as this can cause tissue damage and eventually blindness. Some practitioners recommend shining it in the open eye, but this is dangerous advice and it should not be followed.

Now I’ll discuss LEDs. *LED* is an acronym for *Light Emitting Diode*. An LED is sometimes erroneously called a *soft laser* or *laser*, but it’s not a laser; the monochromatic light emitted by LEDs is *incoherent*. This means, from a physics standpoint, that the peaks and valleys of the waves do not line up. The waves are emitted at random intervals.

In practical terms, this means that the light is *multi-directional* and *diffuse*. Its lack of beam precision prevents an LED from slicing through flesh or any other substance. However, this very lack of coherence also makes LED therapy safe enough to be used by anyone, even a child—and difficult to abuse. LEDs can be used directly on the eyelid to regenerate injured eye tissue. An LED array is much less expensive than a soft laser. Proponents of LED therapy cite studies showing that LEDs are 80% as effective as lasers when used for the same amount of time. And LEDs have widespread applications. “In Israel,” report Cocilovo and Rosen, “medical doctors utilize incoherent light transmitted by light emitting diodes (LED’s) in the practice of neurology, dentistry, dermatology, physiotherapy, and in cosmetic applications to promote collagen and elastin formation.”¹²

Until the 1980s, low-level lasers were used almost exclusively for phototherapy because researchers thought that the light needed to be coherent—and prior promising research with *incoherent* light was nearly forgotten. Subsequently, some clinicians determined that coherency did not make a huge difference. “Dr. Karu,” state Cocilovo and Rosen, “contends that coherent light is not necessary, that incoherent light is equally effective at producing clinical results. Furthermore, she found that coherent light is converted to incoherent light in the body. The exact effect depends on the wavelength, dose and intensity.”¹³

Whether you are using Rife-style equipment with LED or laser attachments, combining these modalities can speed healing. They may also bring better results than if one modality alone were being used. (However, an LED isn’t a mandatory accessory; and when properly used an LED can be effective all by itself.) Royal Rife himself did not use accessories with his ray devices. However, I see no reason to limit ourselves. Times change, technology advances, and people’s needs have multiplied in today’s complex world. If Rife were alive today, I like to think that his inventiveness and curiosity would have carried this technology a lot further.

Zapper

Sometimes referred to as “the poor person’s rife machine,” in some cases a zapper can actually be more useful than a rife-style frequency device. Dr. Richard Loyd—an experienced and skilled practitioner who also makes and sells some of the equipment he uses—has been investigating the electronics of frequency instruments for many years. He writes:

Some years ago, Dr. Hulda Clark discovered that a positive DC offset square wave would slowly kill most, or even all, infections—even if the correct frequency was not used. Thus, the Clark zapper was invented. With a positive DC offset wave, we could treat a non-toxic organism such as *Staph* with a *Staph* frequency, and at the same time we could slowly kill toxic organisms such as Lyme or *Candida* with that same *Staph* frequency. We can reduce *Staph* quickly, which we want, and we can also slowly reduce Lyme or *Candida*, which we also want. All at the same time. We will also be slowly reducing infections that we do not know about, also desirable.¹⁴

Many people use zappers with good results. If you have a rife-style electrode unit, you can create an effect similar to the effects of a zapper if you set the unit to emit a DC offset wave. If you do this, wrap a layer of wet paper towel around the hand cylinders. The paper towel absorbs the toxins and prevents them from returning to the body. It also prevents the electrodes from becoming stained and tarnished due to the impurities. Dr. Loyd found that this setup also helps reduce the level of mold toxins in the body. When mold toxins are reduced, treatments of other conditions are much more effective.

Make Rifing Easy

Design is unique to each machine (size and shape of the unit; knobs, dials or touch screen, etc.). However, most people have never even seen a frequency device. So before buying a unit, ask the manufacturer or dealer detailed questions about the device and request a catalogue with pictures and unit specifications.

Electronics buffs are more willing to operate sophisticated equipment than people who don’t have an affinity for electronic gadgets. A frequency unit should be made so that the average person can operate it, although some are easier to program and use than others. If you like extra accessories, such as LEDs, or require more

functions, you may prefer a more versatile and deluxe machine. However, if you are very ill or pressed for time, consider getting a simpler device. If you don’t want to spend a lot of time learning how to operate a machine, tell your seller.

For most people, the biggest decision is whether to buy a freestanding radiant plasma light unit or an electrode device. But whatever type you choose, and regardless of how many accessories it comes with, your unit *must* transmit the frequencies you select. If the frequencies aren’t accurate, and aren’t accepted by the body, your rifing won’t be successful!

WHAT TO LOOK FOR IN A MANUFACTURER OF FREQUENCY EQUIPMENT

Your Expectations

If you’re reading this book, you either already have a rife machine and want to know more about how to use it, or you’re considering purchasing a rife machine and are seeking guidance on the “best” unit. In either case, you need to know what’s realistic to expect.

I’m guessing that you, or someone you care about, has a medical condition that you’re hoping this equipment will help resolve. While Rife technology is extremely helpful, understand that there are many factors involved in becoming ill (see the beginning of Chapter 1). This therapy can play a very useful role in your recovery as long as you use it as part of an overall wellness protocol. For most people, there are no single substances or protocols that can make them better.

You also need to understand that in many instances, rife machine manufacturers are not allowed to explore medical issues with you—and for this reason, access to information may be limited. People living in countries where Rife Therapy is freely used in hospitals and clinics have access to more data than those living in countries that legally prohibit sellers from making medical claims. Thus, the average consumer must rely on word-of-mouth referrals and anecdotal accounts of success. Although Internet access makes shopping easier in some ways, it can be difficult to assess a machine’s track record if the seller is legally forbidden to tell consumers how to use the equipment for medical conditions or what protocols have proven successful. Once you locate prospective equipment dealers or manufacturers, be aware that they are probably restricted legally from sharing medical information. They can give you the specifications of the machine and tell you how to operate it, but they’ll be unable to discuss

your medical condition with you or tell you which frequencies to use. In the eyes of the law, this constitutes medical advice. If such conversations do take place and are discovered, the seller can go to jail for practicing medicine without a license, and the company may be forced to close.

For these reasons, you will not—or should not, if the company is obeying the law—find references to the diagnosis or treatment of disease in company literature, be it printed or on a website. But remember, this isn't the manufacturers' fault. (In fact, many machine builders I know personally became interested in the technology when they themselves became ill, or they wanted to help their family and friends. They'd probably love to help you if they could!) If the seller doesn't want to discuss your disease, it's important to respect their boundaries.

Below are some codes of behavior that are reasonable to expect from a seller, along with guidelines on what to look for when you're in the market to purchase a rife machine. The following are common sense suggestions, so they could apply to any electronic equipment and any supplier. However, they're especially important concerning a machine that you're buying to restore your health and possibly save your life.

Your Needs

For what purposes are you buying this equipment, and for whom? Do you want something to use for a brief period or for long term? Is this equipment intended for a group to use at the same time (in which case, you'll need a radiant plasma unit) or for an individual (in which case, you can purchase a cheaper electrode unit)? Is it for a human or an animal (in which case, you'll need a radiant plasma device)?

Accessibility of Manufacturer

Know who you are dealing with before you buy, and make sure the seller is accessible. I would not buy an expensive piece of medical equipment without knowing the name of the seller, having a way to reach him/her by telephone rather than just by email, and being able to verify all contact information. If you have questions about how to use the device, or if your machine breaks, you want to be able to contact the seller easily and quickly. A bona fide company has a contact person, a phone number and a physical address (not just a post office box), and a staff that returns your calls within 24 to 48 business hours.

If possible, purchase a unit that can be serviced in your own country. And make sure it's a reputable company or dealer rather than someone who sells machines “on

the side”; you want a company with the facilities for rapid service, tech support, and repair. I've heard several stories from upset people who, after paying for their devices, had problems with the equipment and tried to contact the vendors. The sellers didn't answer the phone, or didn't even seem to have a phone. These customers were then stuck with equipment that didn't work. (I wonder, did it ever do the job for which they bought it?) Unfortunately, there are charlatans in the health field, as in any other market. A few unscrupulous individuals who take advantage of desperately ill people can ruin the good names of the far greater number of honest sellers. I strongly advise against purchasing a unit from an “under the table” company, even if the unit is much cheaper than others. Your health and life, or the health and lives of your loved ones, may depend upon it.

Customer Service and Technical Support

It's important to feel comfortable with the seller, who is a vital link in your support network as you embark on your healing protocol. You have every right to expect technical support—which includes phone conversations, and not just emails—for setting up the equipment, using it correctly, and troubleshooting for malfunctions. Expect a staff member to return your calls within 24 or 48 business hours, or even sooner if you're ill and it's an emergency.

A reliable manufacturer will always test and re-test the unit before it's shipped. Does he or she expect to make improvements to the machine? As machine technology becomes more sophisticated, upgrades can be important. Ideally, the machine should have been made to easily accommodate future additions and upgrades with a minimum of expense. The company should provide upgrades (if applicable) either for free or for a modest sum.

People with cancer must use their equipment each day—at least once, and even twice—and they can't afford to be without it. Some vendors are nice enough to send out a “loaner” until the customer's is fixed. This is great customer service indeed.

Don't expect to be given medical advice. This isn't the job of a manufacturer or dealer, even though you might be tempted to ask for it (especially if your doctor doesn't know anything about this technology). It's understandable if you want the seller to provide medical advice and even emotional support. But remember that in some parts of the world, *dispensing medical advice, in conjunction with selling equipment not legally mandated for medical purposes, is against the law.* The seller could be heavily fined and even go to jail for breaking this law. As a buyer and

experimenter, you have every right to expect courteous assistance. But that's all. Should the seller offer any kind of advice, referrals or suggestions about products, that's entirely up to him or her.

Sometimes, frustrated sellers tell me that they spend hours on the phone with a prospective customer, who then purchases the same unit from someone else for a few hundred dollars less. Although this act might initially save the buyer some money, it's counterproductive because the second vendor is unlikely to provide comparable customer service. When you purchase a unit, you're also paying for the seller's expertise: ongoing tech support, and proper maintenance of equipment that could save your life. I respect the seller's time and energy. Buying from someone who cares enough to provide tireless and courteous customer service more than makes up for a slightly higher price. You get what you pay for.

One more thing. Vendors commonly tell me about getting calls from frantic users who think that the machine has made them sick, when in fact the frequency technology has simply done its job. Remember to drink more water. You may also need to adjust your diet, get into the sauna, and use other protocols. Chapter 3 is all about effective and safe therapies that complement rifting.

Warranty

A standard warranty for most electronic devices is one year for parts and 90 days for labor, or one year each for parts and labor. Some frequency device vendors may guarantee the unit for longer. Is an extended warranty available? If the vendor doesn't have it, ask for one.

Money Back Guarantee

Some sellers offer a 30-day money back guarantee. They may also charge a restocking fee for depreciation of the unit, as it can no longer be sold as new. The restocking fee can range from one to several hundred dollars. Don't begrudge the seller this charge; it takes time to pack, insure, and ship a unit. The restocking fee is no different from that levied by a seller of other items. Consider the restocking charge as a rental fee.

A money back guarantee, even with a restocking charge, is a generous policy. Using a frequency device for, say, \$400 on a one-month trial basis is a wise investment, as it may restore your health and even save your life.

Repair Record

Many people are using this equipment to treat cancer, which usually means sessions twice a day. (See **Frequently Asked Questions** later in this chapter for information on using the equipment for cancer.) Find out how well the unit operates with heavy use. If it needs to be repaired, how easily can you pack and ship it? And how quickly is it returned to you? If your unit malfunctions, you need it repaired and returned to you without delay! What is the fee for repairs?

Ease of Shipping the Unit

This is especially relevant if you need to return the unit for repair or upgrade. Consider:

- ◆ *Size and shape of the unit.* Is it easy to wrap, box, and ship? Is it easily breakable? Find out the shipper's reimbursement policy if the machine breaks in transit.
- ◆ *Location from where the instrument is shipped.* Is the manufacturer in the same state or province? Or in another country? If the manufacturer isn't local, can you send the unit to a dealer or distributor in your own country? Dedicated rifers don't like to be without their machines for long, so proximity to the service location can be important. Also, it's usually expensive to ship your unit overseas. Ask what kind of service comes with the unit before you buy.

Fair Price

Some people new to this technology are surprised when they open the package and see a little square box with two 6-inch metal cylinders and some cables. "You spent two thousand dollars for *that*?" family members exclaim, horrified. And if your doctor—knowing nothing about this technology—starts to criticize and sneer, your doubts can escalate even more. How can you become a confident, successful rifer with so many potential obstacles to overcome—even before the unit is plugged into the wall?

Nonetheless (and I speak from personal experience), a good unit is worth the price. The cost of rife equipment varies, though, and price isn't always a good indicator of quality. Some units are nothing more than standard, off-the-shelf frequency generators sporting a new logo and repackaged with a few wires and electrodes. These devices, which should be the least expensive, sometimes cost as much as better, custom designed equipment. And in the pricier, custom designed units, the better features sometimes aren't obvious because they're built into the internal components. This chapter gives you the

information you need to converse intelligently with the seller and ascertain the sophistication of the unit.

You can buy an effective (electrode) frequency device for about one thousand dollars. Although even this may seem too expensive, consider how much you have already spent on health care. Did it resolve your issues? Now think about how much money you'll save on health care in the future by owning a rife unit now, and how much more it may cost the longer you delay owning a machine. Remember, too, that you're spending this amount all at once, so the initial outlay may seem overwhelming. However, factoring the cost of a machine over a period of many years, you'll pay less than all those doctor visits you made or would like to make—most of which might not even produce the results that a frequency device would. With a good warranty and proper servicing, a rife device should last a long time, work for many different conditions, and can be used by you, your family, friends, and even your pets and livestock.

One more thing. If you're importing your unit from another country, you need to factor in the shipping costs, which are usually much higher than what you'd pay for a machine shipped locally. And don't forget applicable customs charges and taxes. These fees can raise the price of a unit by several hundred dollars.

Claims

It can be difficult to correctly evaluate all the different frequency devices on the market—especially if you, or someone close to you, are ill and need to buy something quickly. Many people don't learn about Rife Therapy until they've exhausted their other options (usually allopathic). But at the point they're ready to buy, they are desperate, and easy prey to any unscrupulous salesperson. Here are some sales tactics you should be aware of when attempting to purchase frequency equipment.

- ◆ *"Making claims such as "Our machine is superior to all others on the market."* This claim pervades the marketplace, and it's usually false. Sellers sometimes post charts on the Internet comparing their units to other companies' units. The problem is, they're judging their modern equipment against outdated, older models from their competitors—thus making their own units seem more advanced than they really are. This is dishonest, and there's no excuse for it. The manufacturer I most respect refuses to make a sale by disparaging other units. He also refuses to sell his equipment to customers who are "looking for a bargain" or who choose hype over honesty. He prefers to let his design and the (actual, not fabricated)
- specifications speak for themselves. He wants only informed consumers as his customers, he says, because being informed is better—both for the rifer and the manufacturer, who will have fewer business problems later if the customer knows what to realistically expect.
- ◆ *Providing misleading specifications ("specs").* Sadly, specs can be designed to deceive, and when engineering and electronics are involved, it's difficult for the average consumer to evaluate them. For instance, a company might boast that its equipment has the highest possible power output. This might indeed be true. *But the highest power level does not necessarily mean that the signal will successfully penetrate the body. Nor does it ensure that the body will accept the signal.* (I discuss this in depth later.) Another devious sales tactic is the use of fancy language when providing the machine's specs. This language may consist of made-up words that sound like impressive engineering terms, but in reality don't mean anything. Or, genuine engineering terms may be used incorrectly—misleading the average person into believing that the equipment is superior, when in fact it's not. Please take the time to read this chapter carefully. An unethical salesperson will be less able to cheat you if you understand the different types of machines that are available, if you know what you need, and if you have knowledge of basic terms. Don't be afraid to ask the seller to define terms. And *keep asking questions until you're satisfied.*
- ◆ *Allegations that a machine is modeled and built exactly according to Royal Rife's specifications.* As explained in detail in Chapter 2, there are many reasons that Rife's original technology did not survive. Certain parts are no longer made, and laws have changed that make it impossible to make machines exactly as Royal Rife did, way back in the 1930s. Also, as technology has advanced since Rife's time, there's no reason to assume that only his equipment could offer the most benefits. Associating a piece of modern equipment with Rife's original units is unfair and misleading.
- ◆ *Using the name of Rife or his original Beam Rays equipment in either the name of a frequency unit or the company that makes it.* People unfamiliar with Rife history or technology could be misled into thinking that they're buying the "real thing." I admit to feeling outright hostility toward these gimmicks, which are obviously used to increase sales. If a piece of equipment is effective and is being sold at a fair price, it will survive in the marketplace.

FREQUENTLY ASKED QUESTIONS

Frequency Equipment

Q. I have a radiant plasma unit. How far from the light should I sit or lie down?

- A. One company suggests being as close to the light as possible. Another company advises sitting at least 6 feet away. Another source conducted studies showing that the tube is effective at a range of 30 feet. Each unit is made differently, so check with the manufacturer.

Q. Will the light from a plasma tube hurt my eyes?

- A. Plasma can emit both beneficial infrared (felt as heat) and ultraviolet-B (UV-B) radiation, which is harmful. Quartz offers no protection from UV-B. Some instruments have leaded glass to filter out the UV-B.

Regarding glass tubes that are not shielded, one researcher assures me that as the radiation is negligible if you're at least 3 inches away, there's no reason to be concerned. Nevertheless, if the tube emits UV light it's a good idea not to stare at it—just as you wouldn't stare directly into the sun because it could cause the retinas of your eyes to become burned. Some manufacturers explicitly state that they make tubes from leaded glass or Pyrex® to filter out the UV rays.

No matter what material comprises the glass, with frequencies lower than 20 or 30 Hz, each individual flash of light may be slow enough to be discerned with the naked eye. Very sensitive people might experience this as mesmerizing or disorienting. Nevertheless, these reactions are not common. So feel free to experiment with ray tube machines. If the flashing lights bother you, close or cover your eyes.

By the way, don't touch the tubes unless the manufacturer gives a specific reason for doing so.

Q. What if something is blocking the light?

- A. Some believe that the best results are achieved if the wave from the radiant plasma tube is not obstructed by furniture or other objects. However, results depend on the equipment being used. The effects of emissions from a Pulsed Technologies radiant plasma machine have been experienced in a house next to the one where the equipment was actually running.

Ask the seller if there are conditions that make the equipment perform optimally.

Q. I have been warned about X-rays coming from the plasma tube. Is this a legitimate concern?

- A. You don't have to worry, advises engineer and rifer Dave Felt.

It takes very high voltages and a high vacuum condition to get any X-ray radiation from a plasma-type lamp. None of the plasma lamp machines currently on the market have those voltages or that high a vacuum. So there is no need to be concerned about receiving X-rays from the Bare-Rife or EMEM [Electro Magnetic Energy Machine] plasma light devices. Also, the light tubes used in EMEM and Bare-Rife devices simply don't have any mechanism to produce alpha, beta or gamma radiation with normal use."

Dave also points out that some plasma lamp devices may *magnetically* induce signals in the electronics of some radiation detectors. "This may lead one to conclude that there is 'radiation' being given off by the plasma lamps. But there is no radiation."¹⁵

Hertz Conversion

12 Hz	12 Hz (hertz); cycles per second, single units
12,000 Hz	12 KHz (kilohertz); thousands of Hz
120,000 Hz	120 KHz (kilohertz); thousands of Hz
1,200,000 Hz	1.2 MHz (megahertz); millions of Hz
12,000,000 Hz	12 MHz (megahertz); millions of Hz
1,200,000,000 Hz	1.2 GHz (gigahertz); billions of Hz
12,000,000,000 Hz	12 GHz (gigahertz), billions of Hz
1,200,000,000,000 Hz	1 THz (tetrahertz); trillions of Hz

Q. Can I be harmed by the radio frequency (RF) emitted by a device?

- A. This is a huge area of contention and debate among Rife researchers. Some manufacturers claim that RF (radio frequency) is necessary, while others say it's dangerous. I'll present both sides, and you can decide for yourself if you want to use a unit that emits RF.

A discussion about RF can be confusing because different wavelengths have different properties. Therefore, let's define RF first. Radio waves span an extremely broad range on the electromagnetic spectrum, ranging from 300 GHz (with a wavelength of 1 millimeter) to 3 KHz (with a wavelength of 100 kilometers). In our modern world, RF is utilized for all sorts of functions. One obvious use is radio transmissions, including CB (citizen band) that's transmitted at 27.125 MHz. This particular frequency is also used in medical, industrial and scientific devices, according to an international agreement that assigns specific frequencies for particular uses. Microwaves, ranging from 300 MHz to 300 GHz, are technically a subset of the RF spectrum. Sometimes they're simply called "microwaves," and sometimes they're referred to as "RF." A major reason microwaves are dangerous is that they cause living tissue to heat (which is how they cook food; see Chapter 3, **Food** for details).

Not all RF wavelengths produce thermal (heating) effects, but the RF wavelengths that don't heat tissue aren't necessarily safe either. Some RF wavelengths are known to cause harm while the effects of other wavelengths are less researched. Dr. Samuel Milham's famous study of active amateur "ham" radio operators revealed a 25% higher rate of leukemia than in the general population, due to their frequent exposure to RF fields.¹⁶ Similarly, a 1997 article called "Radiofrequency Field Exposure and Cancer: What Do the Laboratory Studies Suggest?" from the World Health Organization in Geneva, Switzerland, stated: "Some animal studies suggest that RF fields accelerate the development of sarcoma colonies in the lung, mammary tumors, skin tumors, hepatomas, and sarcomas."¹⁷ In one experiment, the specific frequency of 2.45 GHz aimed at live mice "increased the number of single and double-strand breaks in brain cell DNA when assayed 4 hr [hours] after RF exposure. . . . These experiments challenge the belief that RF fields are unable to break molecular bonds." (Interestingly,

The scientist is not a person who gives the right answers, he is one who asks the right questions.

—Claude Lévi-Strauss
French anthropologist, author,
philosopher and professor
(1908–2009)

treating the rats immediately before or after exposure with the hormone melatonin, at the dose of 1 mg per kg of body weight, blocked the formation of the DNA breaks. This demonstrates the protective nature of melatonin.)¹⁸ The author also cited some harm due to "exposure to very low levels of amplitude-modulated RF fields. Such exposure, *at levels too low to involve heating*, reportedly altered electrical activity of the brain in cats and rabbits; activity of the enzyme ODC, levels of which may be elevated during tumor promotion." [emphasis added]¹⁹ Despite this data, the author also mentioned studies that were inconclusive (and probably conducted or funded by the telecommunications industry, which has a vested interest in finding RF safe).

Considering this information, the average person who wants to utilize frequency therapy may understandably be confused or worried. What about RF in rife machines? Is it safe? Well, it depends—on the person, their health condition, the power level of the RF in the equipment, how long the person's exposure is, their proximity to the unit (see Sidebar, "RF Isn't Always Helpful"), and perhaps other factors that we don't know about yet. It should be noted, as Rife researcher Char Boehm points out, that not all of Royal Rife's equipment utilized RF.

How is RF used in Rife Therapy today? RF can be a carrier wave for other frequencies, the MOR itself, or an emission "byproduct." With radiant plasma units, most that are low-voltage and high-current use RF to produce the plasma. Most of the high-voltage low-current units don't specifically use RF to produce the plasma. However, in the act of switching the power on and off very rapidly (which activates and deactivates the plasma), such units—particularly EMEM and similar machines equipped with a spark plug or spark gap—do produce RF as a byproduct. (*Spark gap* simply means that the voltage is arcing in the space between two metal parts inside the unit.)

One machine that uses an RF carrier wave (albeit at low power) is the PERL M+, a radiant plasma unit from Resonant Light in Canada. The PERL M+ is a Rife-Bare (also called a Bare-Rife) machine, so named because its design is based on a patent held by US chiropractor James Bare, who for a fee licenses the design to companies who wish to manufacture it. Two other popular radiant plasma units from the United States also use RF: the BCX Ultra, and the M.O.P.A. (which attaches to the electrode-equipped GB-4000

generator). The electrode feature on the GB-4000 has an optional RF switch that can be turned on and off. The manufacturers should be contacted directly for the RF specifications used in their equipment, as the signals may periodically be changed.

Rife researcher Bruce Stenulson has had considerable negative personal experience with RF, in addition to observing highly negative responses in others. He maintains that there's no reason to include an RF carrier wave in modern-day frequency devices (either deliberately, or as an incidental result of design). RF can sometimes even affect even those who don't normally consider themselves electrosensitive.

Some electrosensitive individuals cannot even ride in most autos; they are unable to tolerate even low levels of exposure to a common internal combustion spark ignition system without experiencing aggravation and deterioration of their condition. The situation is compounded because people who are highly electrosensitive may also become chemically sensitive. And with people who were already chemically sensitive, their reactions are now heightened. . . . a person who had previously led a "normal" life can become extremely electrosensitive from supposedly innocuous exposures.²⁰

For this reason, Stenulson states, he constructs his units so that they don't emit RF. He also points out that what many people believe is a detoxification response from microbial die-off (discussed later in this chapter) may be a negative response to RF. He emphasizes that as long as the frequencies are emitted cleanly and the pathogen is correctly targeted, a user can obtain excellent results without the use of RF of any kind.

Based on some personal experience and observations of others, I concur that some people indeed react poorly to RF exposure. When exposed to very high RF frequencies from a rife machine, they feel unwell and develop undesirable symptoms ranging from headache and muscle pain to increased infections. The symptoms may vary with each individual, as do the frequencies that cause the symptoms. In our modern society in which we're constantly exposed to electrosmog—from cell phones, computers and other electronic appliances and gadgets to motors and transmission towers—it can be difficult to determine which specific frequencies might be especially problematic for an individual and which RF signals should be avoided.

Nevertheless, based on reports from satisfied rifiers as well as some researchers, there could be a huge advantage to using equipment that specifically

RF Isn't Always Helpful

Not everyone can tolerate being near an RF carrier wave, even if that wave is conveying frequencies intended to restore one's health. Here is one rifer's experience.

The walls and roof of my entire house (though not floors and windows) are shielded from radio frequencies (RF). Friends who come over with their mobile phones have to go outside to use them because the phones don't work in the house. So I have a good experimental space in which I can test RF frequencies.

When I stay too close to my RF plasma system for too long, what I experience is what I call RF loading, and not a Herxheimer or detoxification effect [which occurs due to the die-off of pathogens in the body]. (I'm talking about an RF field generated by a clean high frequency, and not a chaotic signal generated by a spark plug.) For me, RF loading affects the upper body tissue in the form of compression. The neck and skull muscles, known as the occipitals, become tight; this might be due to fascia tightening on these muscles. When these muscles get restricted, they can affect the cervical artery—that is, reduce blood flow out of the brain, which increases pressure in the brain and will produce nasty migraine headaches that can linger for days and not be relieved by drugs. This binding down of tissue on blood and nerve channels can easily lead to other symptoms.

When I sit outside the subjectively discernible RF field that the plasma transmitter produces, I do not experience these symptoms. However, I still obtain the benefits from the generalized electromagnetic field that conveys the MOR frequencies.

—Ken Uzzell

Australian massage therapist and rifer, 2006

generates RF. Jeff Sutherland, PhD, says that in his experience, non-RF units are helpful for most conditions except cancer. He maintains that RF breaks up tumors precisely *because* of its chaotic, "noisy" signal. Richard Loyd, PhD, agrees. For example, he finds an EMEM machine successful for just about every condition except cancer—probably, he guesses, because the metal pieces involved in the voltage sparking tend to get dirty, which prevents the machine from emitting RF as a "by-product" of the signal. When this happens, the overall energy levels fall so much that tumors don't shrink.

Electro-sensitivity is usually cumulative. After prolonged exposure to electrosmog, an encounter with RF from a rife machine may be the final load that creates more sensitivity and health problems. How can you tell if your unpleasant symptoms are due to the RF from a frequency machine? Here are some simple tests:

- ◆ *Step 1.* Sit one to three feet from your RF unit. Run 10,000 Hz, a frequency that helps with cellular repair but doesn't kill pathogens. If you feel bad, you're probably responding to the RF.
- ◆ *Step 2.* Now you need to see if being farther away from the RF unit will help. Sit at least six feet (or seven feet, maximum) from the machine—again, keeping the test signal constant at 10,000 Hz. If you do feel better, you'll know that the RF is no longer affecting you negatively.
- ◆ *Step 3.* Now you need to know if the machine will be effective for you at the distance you selected. Did you feel better because no RF reached you, because of the 10,000 Hz signal—or both? To test whether a frequency will reach you, sit the same distance away from the machine (six to seven feet) and run a frequency that targets an infection you know you have. If your infection dwindles, you'll know that the distance you selected is effective. Plus, you have just confirmed how far away from the machine you need to be to safely use RF.

An alternative test can be done if you have two units, one that uses RF and one that does not. Both can be either radiant plasma or electrode. Run 10,000 Hz on each and see which feels better to you (or if there's no discernable difference).

If you have cancer, should or shouldn't you use a unit that emits RF? Consider the possible long-term advantages of eliminating the disease over the possible short-term disadvantages of RF exposure. Many users report that an RF frequency device has saved their life.

Whatever your condition, the signal must reach its target. You always have the option of using a machine that has a deeply penetrating signal but is RF-free. The radiant plasma and electrode units from Pulsed Technologies (which has offices in the US and Romania) drive the signal into the body via a different, but very effective, method. The photo section in this chapter shows the oscilloscope pictures of the specially manipulated wave forms being sent to, and emitted by, a Pulsed Technologies tube.

Royal Rife stated that the RF from his equipment never harmed him. We have no way of confirming this. However, we also know that compared to modern equipment, Rife's machines were constructed very differently, used a different RF carrier signal, and in general were used for much briefer periods.

One more thing. *RF equipment must be legal.* See Sidebar, "Frequency Devices and Electronic Interference."

Q. Different machines use different RF carrier waves. Does it matter what the carrier wave is?

- A. As discussed in the previous question, different areas of the RF spectrum have different properties. Ask the manufacturer why a given RF signal has been chosen, and if possible, test the unit before you buy it to see if its energy feels good to you.

Q. I have an electrode (pad) unit. Where should I place the electrodes?

- A. *Be careful when using electrodes.* Generally, electrodes shouldn't be used on the face. However, I have done this for dental infections (discussed later in this chapter). *Never place electrodes over the carotid artery* (beneath the bottom of either ear on the side of the neck). This can severely disable or even kill you! Don't ever use electrodes over the heart, and don't use foot plate electrodes if you're pregnant; it might adversely affect the baby. Reread the first pages of this chapter for details.

The most common types of electrodes used for frequency devices are the following:

- ◆ *Hand-held Electrodes.* Two metal tubes, 4 to 6 inches long, are either held in the hand or placed with the targeted area between them.
- ◆ *Electrode Patches.* Up to ¼ inch thick, in the shape of squares, circles or ovals, the patches are generally ½ inch to 2 inches with wires that connect to cords that go into a unit. Equipped with a conductive gel, the patch electrodes stick to bare skin. They're commonly placed on areas that are hard to reach, require detoxification, or contain localized infections. You can place the patches at the armpit (rich in lymph glands), throat (for directly addressing the thyroid or lymph), lower back (the location of kidneys and adrenal glands), or any other area needing focused attention.
- ◆ *Foot Plate.* Metal, sized to accommodate bare feet.
- ◆ *Thin, Flexible Metal Sheets.* Attached to alligator clips, and then to wires that lead to the machine, the sheets are always wrapped in wet cloth or paper towels and wrapped around the body.

Electrodes are useful for focusing on specific problem areas. Some suggested placements are:

- ◆ Either side of the afflicted area. If, for instance, you want to eliminate parasites in the large intestine, hold the electrodes (or stick electrode patches) on

either side of the abdomen. For kidney problems, place one patch electrode at the lower back on either side of the spine.

- ◆ Front and back of the body. For a pulled muscle, for instance in the shoulder, place the electrodes at the shoulder in the front and back of the body.

Placing the electrodes closer together makes the signal more intense. You may need to turn down the power (“volume control,” which makes the *amplitude*, or height of the wave, smaller) when experimenting with the pads close to each other. For more penetration (and better results), wrap wet paper towels around the metal electrodes, and wet the electrodes again when they begin to dry. The water is conductive; wetting the electrodes with salted water will make them even more conductive. Electrode patches should be refreshed (if necessary) with conductive gel or aloe vera gel.

Q. Sometimes when I use the electrodes, my skin develops a rash or blisters. What should I do?

- A.** Crusts, small blisters, and even eczema-type “weeping” are occasionally reported to appear at the sites of the electrodes. “Skin burn” may be alleviated by the use of wet cloths or electrode conductive gel. The gel contains electrolytes (minerals) to lower skin

resistance and increase the ability of the current to flow. The better gels contain aloe vera to minimize skin irritation. You can also use aloe afterward. You may have the power (“volume control”) of the unit set too high. Skin in different parts of the body has varying degrees of sensitivity; so adjust your power setting according to where you’re using the electrodes.

Many experimenters prefer square waves not because of the harmonics, but because they feel gentler on the skin. (Harmonics were discussed in the earlier Insert, “Signal Penetration: Wave Shapes, Harmonics, and Duty Cycles.”) The word “experiment” is apt. You really do need to experiment to find a comfortable wave shape that produces the results you want. This also applies to the frequency. Try a higher harmonic or lower sub-harmonic of the suggested frequency and see if it works while being kinder to your skin.

A few electrode machines are equipped with an optional feature that allows you to use RF (radio frequency) as a carrier for the actual frequency. The RF allows for ample penetration at low power; but as you might feel bad with RF, you’ll have to experiment.

If you have factored in all of the above and you’re still sensitive to electrical current, you may be better off with a radiant plasma device. Some people simply don’t respond well to electrodes.

Frequency Devices and Electronic Interference

Some radiant plasma units emit signals in the RF (radio frequency) range. Before you purchase a radiant plasma unit, make sure that the RF it transmits are in the range allowed by the Federal Communications Commission (FCC). The FCC’s job is to allocate radio frequency bands for specific uses—such as broadcasts, aeronautical and marine transmissions, search and rescue, radiolocation, and amateur (ham) transmissions—as well as to license the users of those bands. Allocation and licensing ensure that vital communications do not interfere with each other. If an operator of equipment causes electronic interference and does not correct the problem, s/he can be fined as much as \$10,000 for each violation and \$75,000 for repeat or continuing violations. For manufacturers and sellers of obstructive devices, fines are even higher! If a machine manufacturer requires you to sign a disclaimer that you absolve the manufacturer from liability if your unit causes interference, there’s a chance that the signal is illegal.

Not all devices require licensing. The FCC allows *low-power* transmitters to share frequency bands with licensed high-power transmitters if certain restrictions are met, including a transmission range of no more than 200 feet (61 meters). This is important for both device manufacturers and the rifers who use them. (Shielding methods such as Faraday cages or mu metal are expensive and impractical for the average person, so won’t be discussed here.)

How do you know if your equipment won’t cause problems? In North America, one of the RF ranges that medical devices are allowed to use—as long as they don’t exceed low-power limitations—is from 26.957 MHz to 27.283 MHz. (Most Bare-Rife equipment uses this range.) This is called the *ISM band*, short for “Industrial, Scientific and Medical.” Rifers have a responsibility to ensure that their machines do not cause electronic interference for their neighbors.

For more information, see:

fcc.gov/mb/audio/lowpwr.html

fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet63/oet63rev.pdf

fcc.gov/oet/spectrum/table/fcctable.pdf

Q. Can I use an electrode and radiant plasma unit at the same time?

- A. This isn't commonly done, perhaps because most people own just one frequency device. However, rifiers who have tried this method report that when they use electrodes on a specific area while using plasma for a systemic condition, their healing is accelerated.

One Rife researcher found that running the same frequency from two plasma units at the same time produces a more rapid positive change than running a frequency from a single device. However, if you use two machines at one time for two separate conditions, there's a slight chance that your body might become confused. More input—be it from drugs, homeopathic remedies, herbs, nutritional supplements, or frequencies—is not always better. See how you feel.

Q. Is it true that radiant plasma devices work better than electrode devices?

- A. Everyone is unique, with different preferences and needs. A machine that pleases me may not please you. Also, the strengths of each type of device may make it more suitable for certain conditions and not others.

Opponents of pad units point out that because Royal Rife never enthusiastically endorsed them, they shouldn't even be used. However, a more valid concern is how deeply into the body the electrical current penetrates. Consumers are understandably puzzled by contradictory claims from manufacturers of each type of unit, so let's address this briefly.

The body is comprised of about two-thirds water, which contains dissolved mineral salts (electrolytes) that naturally conduct electrical charge. For insulation against the constant bombardment of (external) electrical impulses that threaten to confuse our inner electrical environment, we have a barrier of skin. This explains why an electrode's signals coming into the body don't sustain the same shape once they penetrate the skin. Nevertheless, although the skin does prevent some charge from reaching the body, it *does* conduct some electricity. For example, when my engineer friend Howie used a pad unit on his feet, his instruments detected a discernible electrical charge at his head, a clear indication that the current was flowing throughout his entire body. Researchers may not know how much protection the skin offers, or if there's a significant difference between individuals; but nevertheless, the argument that the body doesn't receive enough power from electrodes to impart any benefits, simply isn't valid.

Interestingly, some health professionals obtain even better results with pad than plasma units for certain conditions. One colleague offers a novel explanation for the success of pad units. The path of least resistance to the electrical flow is along the acupuncture meridians. *If the current from an electrode unit falls on or near enough to an acupuncture meridian, that energy is transmitted along the entire meridian and will directly affect the organs, glands, or other body areas that belong to that meridian system.* It's already established that light from a "soft" (non-coherent) laser shining onto an acupuncture point will travel along the entire meridian, so why not current from a pad device? (Users who increase the power on their machines—which increases the voltage, or amount of force driving the signal—find that their muscles start to twitch. This mechanical motion could conceivably destabilize pathogens, but most engineers don't consider muscle twitching necessary or even desirable, because even a low-power signal gets into the body.)

The simplest promotion of electrode devices is made by archivist and researcher Peter Walker: "The argument that electrical energy applied through pads does not reach every cell has been shown to only apply to *short treatments*. After 10 minutes [per frequency] of treatment, the body reaches [its] saturation point." [emphasis added]²¹ Therefore, users of pad devices should simply extend the time of each frequency.

Some wonder whether it's the electrical charge per se, rather than a specific frequency of electrical charge, that destroys the microorganisms. How do we know the pathogens weren't just electrocuted (or stunned)? If this were the case, rifiers would not consistently and emphatically prefer some frequencies over others. For example, many people (including myself) feel their lungs and sinuses clear when they use 1234 Hz.

Some conditions appear to respond better and faster to machines that use electrodes rather than plasma. These conditions include spasms, cramping, pain, and stiffness in the muscles and joints. For these conditions, many users apply the frequencies with patch electrodes.

Here are specific examples of how electrodes might be used. One acquaintance had a severe case of shingles, an infection from the *Herpes* virus that affects the nerves and causes horrible pain with skin blistering and rashes. He almost completely eliminated his condition using a pad unit, perhaps due to increased concentration of electrical charge along the surface of the skin. Another man had a serious, longstanding, huge lump in his neck caused by parasites. After trying

every type of unit on the market without success, he found relief after running frequencies through a metal pan of water into which he immersed his feet. In his case, the current introduced into the water helped when no other method could, including a more conventional use of electrodes.

In my own experience, a severe gum infection responded better to a pad machine than to a radiant plasma unit. Instead of electrodes for the hands or feet, I took special electrodes patches typically used for TENS units, stuck them on my cheeks, and rified once a day for six days. I held salt water in my closed mouth during the entire session to ensure good conductivity. (I began with a small amount of salt water in my mouth—not enough to completely fill it—because the saliva flow increases as time passes, and during this protocol you shouldn't swallow.) Current near the face is always tricky, even when the machine's power setting is low. If you put electrodes on your face, you are experimenting at your own risk!

If electrode units were ineffective, thousands of experimenters would have abandoned them years ago. Pad devices are very popular (and legal for medical use) in Europe. My personal experimentation with rife technology began, in fact, with a standard laboratory frequency generator attached to two handmade electrodes made from plumbing pipes. For two years, I saw my symptoms decrease from frequencies transmitted by this very primitive equipment. Had I not experienced positive results with an electrode unit, I may have discounted Rife technology entirely.

That said, I know experimenters who did not benefit from using electrodes, but saw their condition rapidly improve when they switched to a radiant plasma unit. Everyone is different: only you can evaluate if a unit is helping you. Lifestyle, genetics, degree of comfort with electronic equipment, and health conditions vary. There's room for many different types of frequency machines (and other electromedical healing devices).

Q. My machine doesn't allow me to program frequencies into it. Instead, it uses code numbers that correspond to channels with preprogrammed frequencies. Does it matter that I don't know what frequency I'm getting?

A. Some devices are pre-programmed with code numbers that represent frequencies. For example, on one machine code number 1 corresponds to 10 KHz, code number 2 corresponds to 1050 Hz, and so on.

There are many disadvantages to machines that use code numbers in lieu of frequencies. The frequency

emitted is hidden from the user. Even if the operator's manual reveals which frequencies belong to which code numbers, what if you want to use a frequency that hasn't been programmed into the machine? With the escalation of new virulent pathogens and the discovery of frequencies for them, the inability to program a unit with an actual frequency is a serious handicap.

Some manufacturers of coded equipment offer upgrades as new frequencies become available. The customer sends in the unit, and the new frequencies are added at the factory. However, this feature keeps the user perpetually dependent on the manufacturer for improvements—not to mention the cost of shipping, and the disadvantage of not having your machine when you need it. Consider these points before purchasing a unit that relies solely on code numbers. There are similar problems with equipment that uses CDs.

Coded machines can be convenient, though. For the very ill—who often lack the energy and brainpower to run their devices—pre-programmed channels, which require only one simple number to bring up many frequencies at a time, are easy to operate. However, most manufacturers of user-programmable devices are now also offering preset programs. The frequency banks are already in the unit (either as a regular feature at no extra cost, or by special request for an extra fee if the customer asks for it). In such non-code machines, the convenience and ease of pre-programming are available while still allowing the user to remain completely in control of his or her health regimen.

Serious Rife researchers never work with coded machines. If frequencies cannot be programmed or verified, reproducible protocols—or improved technology—cannot be developed.

Q. My rife machine has a feature called *sweep*. What does this do?

A. Organisms all have a Mortal Oscillatory Rate (MOR). However, when threatened by a hostile environment, pathogens protect themselves by mutating—mutations which correspond to a slightly different MOR. We can compensate for these variations by programming the rife machine to run some frequencies on either side of the main frequency, a process known as *sweeping*. This sweep targets both pathogens that have the typical (and expected) MOR, as well as those that deviate from the average MOR. Another way of describing sweeping is *micro-stepping*, *incremental stepping* or simply *stepping in increments* or *sweeping in increments*.

Sweeping depends mainly on how a machine is set up to be programmed. Here are several possibilities:

- ◆ *Example #1.* Enter the main MOR frequency into the machine. Then indicate how many Hz to vary on either side of the main signal. Most machines move in increments of one Hz, but—depending on the sophistication of the unit—some move in smaller steps of, say, .001, 0.01, 0.05, or 0.1 Hz on either side of the main signal.
- ◆ *Example #2.* The sweep function makes the signal oscillate between two numbers. Say you want the unit to run frequencies between 2000 and 3000 Hz. Two thousand is the lower number you program into the unit; 3000 is the upper number.
- ◆ *Example #3.* The main signal is 728. The program runs five additional, 1-Hz steps going upwards from 728: 729, 730, 731, 732, and 733. There may also be five additional, 1-Hz steps going downwards from 728: 727, 726, 725, 724, and 723, so that eleven frequencies total are run. Each manufacturer may call this function by a different name.

Important! *When you run a sweep, lengthen the time of the overall session.* You're cramming many more frequencies into a program, so you want each micro-stepping frequency to linger long enough to do its job. If you don't devote enough time to each frequency, you'll stimulate the pathogens instead of devitalizing them. So when you're rifting, the more frequency steps you include in the sweep, the more time you'll need. If your unit requires 90 seconds on each frequency, add 90 seconds for each increment. If your unit requires 2 minutes on each frequency, add 2 minutes for each increment, and so on.

Incidentally, the instability of Royal Rife's units was probably beneficial, as the treatments inadvertently swept around the single target frequency. The "main" pathogen was targeted along with the adjacent mutated offspring. Today's machines are much more stable; so we must intentionally program specific, incremental frequencies in a controlled manner.

Q. My rife machine has a feature called *converge*. What does this do?

- A. *Converge* is similar to a sweep. This is built into the equipment to ensure that all the pathogens are targeted in case any mutations arise. Normally, pathogens may escape the effects of frequencies by contorting their

cell walls. When the pathogen changes its shape, it changes its frequency. Theoretically, a symmetrical sweep enables a pathogen to keep contorting in sequential and regular intervals, just a little more with each frequency increment. With a converge, though, the pathogen can't adapt as easily because the changes it must go through are more complex and less predictable—the frequency alternates above and below the target number in random order. For example: 728 is the main or target frequency, and five frequencies below it and five frequencies above it will also be run. But the order of the frequencies might be 733, 723, 732, 724, 731, 725, 730, 726, 729, 727, 728. Because the order is random, the pathogen will be less likely to adapt. Some Rife researchers believe that to prevent mutations and cover all possible MORs of a harmful microbe, a converge works better than a sweep.

Q. My rife machine has a feature called *gate*. What does this do?

- A. Normally the body becomes impervious to a signal that's constant, steady and unwavering. Say someone is stroking your arm with a constant rhythm and pressure. At first you notice the motion and sensation; but after a while, the nervous system compensates for the unrelenting (but non-dangerous) stimulus by becoming anesthetized. This is a natural adaptation; it frees the senses to focus on new stimuli that might require more attention. Similarly, the area of the body harboring the pathogens may become resistant to the frequency device signal. If the body blocks the signal, the pathogens won't be affected.

To bypass possible resistance from both microorganisms and body tissues, engineers add a *gating* feature to their equipment. Gating causes a regular pause in a steady signal, similar to the opening and closing of a gate. The gate is opened to allow a series of signals through, closed briefly, and then opened to allow another series of signals through. This "on, off, on, off, etc.," feature causes a sudden spike on the wave, which drives the frequency into the body so forcefully that the body does not interpret this as a foreign signal and thus does not resist it. This type of wave with an abrupt spike is said by engineers to have a *rapid rise time*.

Most rifers find this spiked waveform desirable (as did Royal Rife himself). However, not all researchers

I've found out so much
about electricity that
I've reached the point
where I understand
nothing and can
explain nothing.

—Pieter van Musschenbroek
Dutch physicist and
mathematician
(1692–1761)

find gating effective. Jimmie Holman writes: “If you are already using well designed equipment that’s capable of accurate and consistent delivery at higher frequencies, the use of gating is actually *counterproductive* because it acts as a break in the steady transfer of energy.” He illustrates his point with the example of soldiers marching on a bridge, who are ordered now and then to “break step.”²² Because their *unison marching rhythm is a wave—in other words, a frequency*—this can make the bridge shake and sway. Sudden halting breaks the rhythm, dissipates the momentum, and stops the swaying. Clearly, the benefits of gating (or the need for it) depend on how the equipment is transferring energy into the body. The goal is to get the body to accept the signal so it can utilize the energy. Holman’s devices, manufactured by Pulsed Technologies, can do this without using a gate feature, and the proof that this works is seen in the results. However, with other equipment, the gate feature is needed and works well.

Among those who prefer a gating feature, there is some debate as to the most effective rate. One analysis of an original Rife Ray revealed an incredibly rapid gating cycle; but as its rapidity was intricately tied to how the unit was configured to transmit frequencies, the rate cannot be applied to modern equipment. Some contemporary manufacturers have a precise formula for the amount of time the signal is on versus the amount of time the signal is off. For example, in one machine, the signal is on two-thirds of the time and off for one-third of the time. Some manufacturers build their units to be programmable with varied gating rates. Dr. Richard Loyd even has a formula for gating percentage according to the which frequency is being used.

Ultimately, the on-off rate of gating may be less important than the fact that the unit can be gated at all. The purpose of gating is to ensure signal penetration; so as long as both the body and the harmful microbes are receptive to the frequencies, that’s the most important thing. One researcher is experimenting with higher-than-usual gating cycles. However, they appear to produce physiological responses rather than kill harmful microbes, and their effects are still largely unknown. Thus, they aren’t recommended for the average user. Be aware that most RF plasma units cannot sustain abnormally high gating cycles.

One more thing. *Do not use the gate and the sweep functions at the same time, ever!* Some of the frequencies will run during the period when the signal is in the “off” portion of the gate, resulting in incomplete coverage of those frequencies, or even missing coverage of those frequencies entirely.

Q. My rife machine has a feature called *pulse*. What does this do?

A. Many rifers (who are not engineers) use the term *pulsing* when they really mean “gating” (discussed in the previous question). This can be confusing, because the word “pulse” is used in the phrase “Pulsed Electromagnetic Fields” (PEMFs), which means something else entirely. My personal preference, then, is to use the term “gate” instead of “pulse.”

Q. My unit already contains some protocols. Did someone program frequencies into the unit and forget to erase them? Was I sent a used or reconditioned unit?

A. Many rife machine manufacturers pre-load programs into their new units as a courtesy to their customers. They realize that some people are too ill to program the units themselves, and thus welcome this convenience. Some of the custom programs are popular frequencies for common ailments, while others may be for cancer. By the way, because your machine cannot be sold as a medical device (see pages 560–561), the cancer programs might not be called “cancer.” Instead, the readout might say “CAN” or something else.

Ask the seller if your machine is used. If it was, you should have received a discount in price.

Q. I’d like to decrease the amount of time I spend rifing. Some machines can transmit several frequencies simultaneously. Are they reliable?

A. There are two well-known frequency machines that can deliver more than one frequency at a time: the radiant plasma PERL M+ from Resonant Light, and the GB-4000 pad unit from AAA Productions. With the PERL-M, the radiant plasma part of the unit is powered by a portable generator called a ProGen 2. Two or three ProGen 2 generators can be hooked up together in sequence, which allows two or three frequencies to be emitted from the radiant plasma tube at the same time. With the GB-4000, up to eight different frequencies can be transmitted simultaneously through the hand-held electrodes.

To answer this question, I’ll provide the engineering perspective first. One engineer (who does not sell equipment himself) measured the waveforms emitted by the device on an oscilloscope, and found that the integrity of the frequencies may be compromised. Jimmie Holman of Pulsed Technologies describes how this could happen:

Imagine swinging on a swing. If someone pushes you at the right time, the amplitude (height) of your swing increases and you can go very high. But the pushing has to be in tune with your natural frequency. If someone pushes you at random intervals, chances are it will not cause you to swing much higher. In fact, another hand pushing the swing at a different frequency, at just the right point in time, might even disrupt the momentum already gained and built up, and make you swing less.²³

This principle applies to more than swings. Earlier, I mentioned soldiers “breaking step” after rigorous marching in synchronous rhythm. The synchronous marching makes the bridge sway, while not marching at the same time halts the swaying. If everyone walks across the bridge at their own pace, in staggered steps, the bridge no longer sways. It might shake, but any momentum produced by one long, continuous wave is considerably reduced or eliminated entirely. Apply this principle to many frequencies being emitted simultaneously: a session’s effectiveness will suffer.

Also consider power. With more frequencies sharing the same power level, the output of each frequency is lessened. Thus, from an engineering perspective, effectiveness is greatly reduced by the multi-frequency function. Even Jeff Garff, designer of the multi-frequency GB-4000, concedes that simultaneously transmitted frequencies can interfere with each other.

Nevertheless, in real life, the majority of people who use such machines report major or complete relief from their ailments. This leads to the question: If a waveform consisting of combined multiple frequencies has less power than each individual frequency alone, why are the GB-4000 or the PERL-M (to use two examples) reported by users to be effective? Their success may be due to an RF (radio frequency) *amplifier*, which drives the signal more deeply into the body. Other principles may also be involved—for instance, the host’s cellular function has improved due to the recharging of cells, independent of any pathogen devitalization that might be occurring. Ultimately, it’s the user’s experience that determines effectiveness.

Q. Do rife machines require special care?

- A.** High quality electrode equipment generally costs around a thousand dollars, while radiant plasma units can be five thousand dollars or more. *Make sure to*

use a surge protector, as you would with a computer, DVD player, or other electrical equipment. This will protect the delicate components from being damaged from unwanted surges of power (which can occur during lightning storms). *You cannot afford to have this equipment break down.* Some surge protectors guarantee against equipment damage to \$50,000. It’s worth investing thirty or fifty dollars for a good surge protector to preserve and extend the life of your rife unit. As with other electronics, keep the rife machine away from extremes of moisture and temperature. And wipe it clean according to the manufacturer’s instructions. You can cover it when it’s not being used.

Q. Will my rife machine affect other electronic equipment?

- A.** This depends on the type of rife machine and how it’s manufactured. Electrode units don’t interfere with other machines because the frequencies are not transmitted through the air.

A plasma unit won’t affect other electronics unless it’s not properly grounded, although an RF carrier wave might still cause a problem. All plasma instruments emit audio signals that are audible in certain ranges and can be heard through telephones, TVs, and some other appliances. This is normal and temporary, and doesn’t hurt either the rife machine or the other electronics. If there’s too much interference, plug the rife machine into a different electrical outlet, even one in another room. Or buy a clamshell RF choke from an electronics supply store and clip it around the electrical cord of your rife machine. This will reduce the effects of a “noisy” machine.

Q. My large heavy unit, which runs on a computer, is on a metal cart so I can wheel it from room to room. When I turn it on, the display is distorted. Why?

- A.** A metal object can act as an antenna: it can absorb, dampen, conduct, change, or otherwise interfere with the plasma tube’s signal. Assuming there’s nothing wrong with the cables or ground wires leading in or out of the device, the problem is due to signal interference from the metal cart. The change in the monitor’s picture indicates distortions in the magnetic field around the monitor as the metal conducts a portion of the field back into the circuitry of the machine. Use a wood or plastic cart.

Hand Built EMEM Equipment from Experienced Engineers

EMEM, or “Electro Magnetic Energy Machine”

Bubble-shaped plasma tubes are common. This machine is equipped with two tubes. Frequencies are manually dialed using the front knobs, characteristic of all analogue units. A frequency generator such as the ProGen 3 (next page) can be plugged into the external input jack, providing many automatic features to make the unit digital.

Courtesy of Dave Nelson

another EMEM plasma unit

Like the above unit, frequencies are manually dialed using the front knobs, making this EMEM analogue. A frequency generator such as the ProGen 3 (next page) can be plugged into the external input jack, providing many automatic features to make the unit digital and able to perform many signal processing functions found on fancier units. Users have reported feeling its output strongly.

Frequency Equipment from Resonant Light Technology Inc.

PERL M+

Size: about 17.5" wide $\times$ 5.5" high $\times$ 12.5" deep

This radiant plasma unit, based on the patent held by James Bare, uses an RF carrier wave and comes with an optional hard case for traveling with storage for extra light tube, accessories and manuals. (ProGen 3, the generator in the front that runs the unit, looks much larger than it actually is.)

ProGen 3

Size: about 6" $\times$ 6.5" $\times$ 1" deep

Newly designed, it has over 8000 channels for frequency sets that can be saved after being programmed.

Emits frequencies up to 3.1 MHz.

It can run the PERL M+ at the same time as two contact accessories such as hand-held electrodes or patch electrodes.

The PERL M+ can be run with up to three ProGen 3 generators, permitting up to three different frequencies to be emitted by the single tube. The screen in background is optional. It can be plugged into an auxiliary port to emit frequencies inputted from a computer or other instrument.

Frequency Equipment from Subtle Light & Sound Technology

BCX Ultra

Small and portable, with hand-held electrodes, foot plates, and hand-held ray tubes that use an RF carrier wave. Digital readout displays the frequencies, times, and custom gating and waveform features. (Further specifications unavailable from manufacturer.)

Radiant plasma tube, which connects to the BCX Ultra, is a circular spiral with a large open core. The subject usually sits or lies near the machine, but can also place a hand, wrist or forearm at the center of the spiral to treat injuries.

Frequency Equipment from Pulsed Technologies

PFG 2Z (Precision Function Generator)

Size: a compact 6" × 3.5" × 1"

Designed for a USB interface with a computer, it's controlled by the PFG Lab software (included). A Universal AC power supply comes with plug adaptors for most countries.

P3Pro (Precision Pulsed Plasma for Professionals)

Size: about 16" wide × 10" high × 3.5" deep

Its embedded PFG 2Z Precision Function Generator can emit frequencies via electrodes or radiant plasma. Designed to interface with a Windows-based PC, notebook, or tablet computer, it's run by the PFG Lab software (included). The P3Pro includes the imprintable Colloidal Silver maker.

Frequency Equipment from Pulsed Technologies continued

P3 (Precision Pulsed Plasma)

Size: 16" long, 4" diameter

The integrated feet at the bottom allow for tilt positioning.

This unit is controlled by the PFG Lab software and the PFG 2Z Precision Function Generator.

Its power supply is universal.

The P3 Plasma system can be easily added to any existing PFG 2Z (or earlier) system.

No Pulsed Technologies unit uses an RF carrier wave.

Instead, unique engineering changes the waveforms.

Photos depict waves from two Pulsed Technologies plasma units as seen on an oscilloscope.

Bottom: Waves sent from the function generator to the tube.

Top: Waves emitted from the tube.

The manipulated waveform sent into the tube by the frequency generator is entirely different from the waveform coming out of the tube.

The fast rise times and sharp points to the waves drive the signal deep into the body.

Frequency Equipment from Pulsed Technologies continued

iCS (imprintable Colloidal Silver) maker

Connects to Pulsed Technologies PFG 2Z (*right*), earlier model generators, and the P3Pro. To manufacture colloidal silver, it uses Pulsed Technologies PFG Lab software (included). The ionic silver solution is created with silver particles up to 50 ppm. A second, optional step imprints the fluid with frequencies the user selects. The solution can be used in the same manner as any homeopathic or colloidal silver solution.

VSG (VitaSet Generator) Size: 7.5" × 9.5" × 1.5" deep

VSG, controlled by microprocessor, aids those affected by high electrosmog environments.

Day Mode: Cycles throughout the five primary natural Schumann Resonances.

Night Mode: Cycles through certain subharmonics of Schumann Resonances corresponding to regenerative brainwave states to help induce sleep (via brainwave entrainment).

Unit can be set to automatically switch between day and night modes, or it can be manually overridden. Operates on universal AC or battery for travel; adaptor and plugs included.

Frequency Equipment from Health Balances

F-Scan®

Size: 8.5" × 6.1" × 5.5"

This Swiss-made device has a touch screen.

It uses any type of electrode, including cylinders and patches.

To analyze which frequencies the person needs, it scans the body for resonating frequencies or “hits,” and then delivers them to the user.

The F-Scan® with its touch screen in operation. Peaks on the graph show resonant hits.

F-Scan Compact®

Small enough to fit into a pocket.

Frequencies can be downloaded into it from the larger unit, or it can be programmed by itself.

Compact is also equipped with built-in frequency programs. A more advanced Compact model can also scan.

Rechargeable battery lasts for up to 3½ hours.

Frequency Equipment from Health Balances continued

Live blood, before session with F-Scan®

Live blood, after session with F-Scan®

Rife researcher Richard Loyd, PhD, comments: “In September 2001, I had the privilege of taking part in a seminar in Tokyo. At the seminar, a dark field demonstration was done on a volunteer. The blood was sticky and there was a lot of fibrin, which is often caused by infection. Frequencies were administered using the F-Scan. A second sample of blood showed that the stickiness had broken up and the fibrin was gone. I was told that this demonstration is often done with similar results. Since then I have tried this several times and have noticed that 62,000 Hz and 63,000 Hz are very common hits. The blood always looks much better after the frequencies are applied.”

Frequency Equipment from AAA Production

GB-4000 (*right*)

A frequency generator with a 3.1 MHz carrier frequency, it emits and sweeps from 1 to 20 million Hz.

Can be used as a contact device with either hand or foot electrodes.

Can simultaneously run two frequencies from 40,000 Hz to 20 million Hz, or as many as eight frequencies up to 40,000 Hz.

SR-4 amplifier (*optional, left*)

Has a variable power output.

Size of each: 9.5" wide × 4" high × 8" deep

M.O.P.A. (Master Oscillator Power Amplifier), plasma tube on top (*left*)

Size (components in box): 17" wide × 10.5" high × 10.5" deep

Size (tube only): 15" wide × 9" high × 7" deep

Inspired by Royal Rife's 1930s Beam Rays Corporation design, it uses a tank coil and vacuum tube and outputs sideband frequencies.

The tube is sold by a company separate from AAA Production.

The GB-4000 (*right*) runs the radiant plasma M.O.P.A.

The Ergonom Microscope from Grayfield Optical Inc.

Ergonom 500

One of several Ergonom models.

In 1976, Kurt Olbrich invented a microscope with slightly higher magnification levels, better depth of field, and more vivid color contrast than Rife's instruments.

Operating on different principles than Rife's microscopes, the Ergonom is considerably easier to use as it requires no staining, oil immersion, or complicated focusing.

Amphipleura pellucida, a type of microscopic algae, as seen through the Ergonom.

The finely detailed markings on this species are not as clearly visible under typical microscopes.

Various diatoms, as seen through the Ergonom. These microscopic algae come in different shapes.

Close-up of a diatom from the above group.

Q. I'm nervous about running equipment that's used for serious therapy. Aren't rife machines difficult to operate?

- A.** The ease of rifting depends on how comfortable you are with electronic equipment, the features of the machine you're using, and how ill you are. Some units are no more complicated to operate than a simple DVD player, while others are more complicated, especially if they have multiple programming options. A surprisingly large number of people are leery of rife technology because they're intimidated by machines. If you're technophobic, ask someone who has grown up with computers and fancy electronics gadgets—your son, daughter, grandchild or a kid in the neighborhood—to help you. With a little practice, you'll soon be comfortable operating the machine.

People who are very ill often require extra assistance, even if the device is user-friendly and the seller provides competent telephone technical support. If you have a serious health condition, ask a relative or friend to help you set up and operate the machine. The following story illustrates how important this can be.

A woman with a debilitating case of Lyme once sought my help because she was having trouble with her unit. She sent it back to the manufacturer for repair soon after she bought it. After she received it a second time, it still didn't work for her. Fuming, she returned the unit and demanded a refund. Knowing that the manufacturer is very ethical, I called the owner in great surprise and asked what the problem was. She explained that the machine had worked perfectly each time it was tested in the company's lab. However, she said, they would refund the customer's money anyway because she was apparently too ill to operate the machine properly. This appraisal made sense to me, as the customer had told me herself that one of her symptoms was "intense brain fog." Unfortunately, this woman did not have any friends or family members who could operate the machine for her. So, if you want to use a rife machine but feel too ill to run it, I urge you to find someone to program the unit—and if necessary, even push buttons for you—until you're well enough to run the equipment yourself.

A reliable vendor will include an operator's manual with your unit (printed, on disc, or downloadable

online). Note that an operator's manual is limited to the features and care of the device, and how to operate it to transmit a signal. Unlike a frequency manual (such as Chapter 5 of this book), an operator's manual does *not* describe what conditions the frequencies themselves are designed to address. It can't, for legal reasons.

Q. Diagrams on the Internet explain how to build a rife machine. How hard could it be to construct my own?

- A.** *Be very careful! Do not assume that these units are simple or cheap, or that anybody can build them.* To those unfamiliar with engineering or electronics, constructing a rife technology device might seem simple. Yet there are many variables that help make a machine successful: voltage, the gases in the tube, the pressure of the gases, how the wiring inside the tube is wrapped, the positions of the internal components, the lengths of the cables, the shape of the wave—and the combination of all these elements. Also, different gases amplify the frequencies in different ways and these gases subjectively feel different. Unless you're skilled in electronics and really know what you're doing, you may create a device that not only doesn't work properly, but that could seriously injure you.

I'll never forget a man I met at a holistic health conference about two decades ago. Having just begun to tinker with electronics, he fancied himself an expert and boasted that he could build a better rife machine than those built by other people with much more experience. Then he inadvertently discredited himself by sharing what happened when he built his first unit. It's hard to know whether he made so-called improvements to the schematic or simply built it incorrectly—or even if the plans were accurate. At any rate, he didn't notice anything unusual after turning on the unit, but his wife began to suffer excruciating pains in her chest. She repeatedly asked him to turn off the machine; but as he was focused on his handiwork and not her, it took a while for him to respond. By the time he turned off the machine, she had suffered heart damage.

Don't let this story dissuade you from buying a unit or borrowing someone else's; I told it to make a point. Your unit should be made by an experienced engineer. Although the plans for a rife machine might seem simple, it's not worth risking your life, or the lives of those you love, by building dangerous or malfunctioning

Knowing others is intelligence;
knowing yourself is true wisdom.
Mastering others is strength;
mastering yourself is true power.

—Lao-Tzu

Chinese philosopher and writer,
the founder of Taoism, and
regarded as the author of the
Tao Te Ching
(died 531 BCE)

equipment. If you're a beginner in electronics, a rife machine is not a wise first project! Even if the unit you build is merely ineffective rather than dangerous, if you intend to use it for a serious or life-threatening condition, you'll lose valuable time working with a machine that doesn't produce results. Reliable companies thoroughly test their units before releasing them for sale.

Q. Why do manufacturers charge so much? Don't they care about people's lives?

A. The best answer is from a frequency device builder.

These machines are built from custom components that must be shipped in from all over the world. The same holds true for the oscillators, front bulb connectors, many internal parts and components, shields, grounding tubes, and just about everything else that is developed to improve this technology. The bulbs are hand blown.

Hours are spent in research and development. Something as simple as upgrading to a new oscillator may involve up to a hundred hours to retrofit it into a previous machine. Few people understand or realize what is behind this technology. And the work doesn't stop with the sale. Frequently I give ten hours of additional support or more to each customer. There is also the cost of providing warranty service.

If these machines were mass produced like computers, the prices would be a fraction of what they are now. But at this time, frequency devices are used by a limited number of people. Consider, too, the constant risk factor from various medical and government agencies that may decide to destroy your years of investment at any given time. It is a wonder that anyone is willing to produce these machines at all. [This pertains to the US and Canada; in many European countries, devices are less expensive because they're legal for medical use.]²⁴

Manufacturers have to eat, too. Earning a living wage from the sale of rife machines can be an honorable profession. (Compare this to unproven drugs from companies that routinely lie to the public.) If a particular device isn't suitable for your needs, keep looking. Appendix A lists some manufacturers as well as Internet rifting groups. Many experimenters are eager to share their experiences, and will tell you what has and hasn't worked for them.

Q. I'm convinced that I need to buy my own unit. Should I try to obtain a real rife machine?

A. If by "real rife machine" you mean Rife's best Beam Rays device (from 1934), it's almost impossible to find a working model available for public use. Also, as Rife researcher Jason Ringas has stated, "There is no true Rife technology, only true Rife methodology."²⁵ Modern frequency machines aren't exactly like Rife's original devices due to three factors: legal restrictions (manufacturers aren't permitted to use the high RF carrier wave that Rife used); the availability of different components; and incomplete knowledge of how Rife's equipment worked. However, although contemporary devices don't work exactly the same way as Rife's original machines, they do devitalize pathogens and help normalize body systems.

The best modern frequency equipment has a good to excellent track record in restoring health. Considering the toxic effects of drugs and the trauma of surgery, I can't imagine why anyone wouldn't want to at least give Rife Therapy a fair trial. By the way, the FDA is hostile toward any equipment associated with the name "Rife." The few companies whose units *are* legitimized by the FDA never use the word "rife."

Q. Some rife units in the United States are approved by the FDA. Are these machines better than the ones that aren't approved?

A. It's highly unlikely that a rife machine is "approved" by the FDA. "Approval," when used in conjunction with the FDA, is a legal term that refers to *medical devices only*. I'm not aware of any modern equipment, promoted as based on Rife's technology, that the FDA categorizes or has approved as a medical device. It costs billions of dollars to get a piece of equipment approved for medical purposes, and I don't know any rife machine manufacturers who can invest huge sums of money. Even if the funds were available, you may recall from Chapter 2 that the FDA has always been hostile towards Rife and the doctors who used his equipment, as frequency therapy can equal lost income from pharmaceuticals. Except for some experiments that use a modified Bare-Rife unit in a medically supervised setting (see Appendix E), that climate—at least in the US—has not changed very much since Rife's time. Chances are, any company claiming that its units are "approved" either doesn't understand the terminology or is using a misleading marketing ploy to sell machines (at the risk of getting into extensive legal trouble).

The FDA has very specific guidelines regarding what it does and does not allow. Briefly, medical equipment is *cleared* (not “approved”) by the FDA if the agency has determined that the equipment is substantially equivalent to another device that has already been legally marketed. New and different medical devices are generally considered “high-risk,” so they must be submitted for *approval* and are subjected to a much more stringent and critical review.

Because of the sums of money involved in getting a medical device approved—and the chance that a non-invasive, genuinely healing machine might *not* be approved—some manufacturers of electromedical equipment (whether “rife” or not) apply for FDA clearance. *Clearance* means: “If it’s like something that’s already legally on the market, you can sell it.” As it turns out, the one medical device that’s already legally on the market is the well-known *TENS* unit, which stands for “Transcutaneous Electrical Nerve Stimulation.” The TENS unit is a convenient standard for FDA clearance, even if the equipment that’s cleared is very different in principle from a TENS machine. Avazzia instruments and the Tennant Biomodulator® have been classified as TENS units. The website of a coded frequency machine also states that the unit has been cleared by the FDA in the TENS category.

Not surprisingly, a TENS unit doesn’t heal. It operates on very different principles, and has vastly different effects on the body, than any rife-style machine. TENS was developed specifically for *pain relief*, but the means by which it controls pain is anything but natural: it emits current at *much* higher levels than that produced by the body’s own nervous system. These high levels of current numb and deaden certain nerve fibers so pain is no longer felt. The machine “works” by temporarily suppressing symptoms, not by restoring cell and tissue function.

Rife’s technology works not only by devitalizing pathogens (which brings us into the forbidden medical realm, as far as FDA approval is concerned), but also by energizing cells, not deadening them. However, if a rife machine company wants to avoid legal problems, it must obey the law. If a holistic electromedical device is FDA-cleared, the company is legally prohibited from discussing, advertising or promoting its product for anything other than what the FDA has allowed. (This means that the company is obliged to publicly

undervalue the capabilities of its unit.) All uses other than the TENS-related pain relief function are *off label*. This term is often used for practitioners, who at their own discretion may choose to use a piece of equipment (or drug) in a manner that hasn’t been approved by the FDA.

If a rife machine company falsely claims that its unit is “approved by the FDA”—or if it associates the names of diseases, or the words “cure” or “treat” with its machine—it’s breaking the law. To some laypersons, as long as the equipment works these legalities may

not matter. However, I prefer dealing with companies that know and obey the law. And to a doctor, naturopath, massage therapist, chiropractor or other licensed professional, it may matter a great deal to buy and use equipment only from companies that obey the law.

By the way, anyone who sells or manufactures a rife machine and uses the word “device” to describe the unit, could go to jail. (People not involved with sales or manufacture are free to use the word.) See Sidebar on page 562, “The Appropriation of Language.”

Believe nothing,
no matter where you read it,
or who said it,
no matter if I have said it,
unless it agrees with
your own reason
and your own common sense.

founder of Buddhism, born in Nepal
in the 5th or 6th century BCE

Rife Sessions—When Using Any Machine

Q. What is a *Herxheimer* reaction?

A. A *Herxheimer* reaction is a fancy name for detoxification response. It’s named after the German dermatologist Karl Herxheimer (1861–1942) who described it. He found that “Herxing” was the result of the foreign proteins released by dying pathogens. (Sometimes this response is called the *Jarisch-Herxheimer* reaction, after Austrian dermatologist Adolf Jarisch (1850–1902) as well, who published his description of the same phenomenon seven years before Karl Herxheimer did.)

Excessively large amounts of microbial waste prevent the body from adequately eliminating it through the usual channels (breakdown by the liver, and through the colon or urinary tract). Instead, the toxic material is discharged through the lungs, sinuses and skin. Symptoms often feel like the flu: fever, with or without chills; heavy perspiration or night sweats; headache; malaise; diarrhea, nausea and vomiting; pain in joints, muscles and bones; and itching, flushing, and red areas of skin. Lower back pain may also be involved, as the kidneys (located in the lower back) are responsible for filtering out debris.

The Appropriation of Language

Most people aren't aware that the word "device" has been appropriated by the FDA. The common(sense) definition of the word, used in normal and casual conversation, is "a piece of equipment or a mechanism designed to serve a special purpose or perform a special function [such as] smartphones and other electronic devices."²⁶ Based on this definition, it's natural to assume that the phrase "frequency equipment" or "rife machine" can be used interchangeably with the phrase "frequency device." However, according to the FDA website, when used in a context that suggests medicine or the elimination of a health problem, a "device" can "range from simple tongue depressors and bedpans to complex programmable pacemakers with micro-chip technology and laser surgical devices." The FDA website further states:

If a product is labeled, promoted or used in a manner that meets the following definition in section 201(h) of the Federal Food Drug & Cosmetic (FD&C) Act it will be regulated by the Food and Drug Administration (FDA) as a medical device and is subject to premarketing and postmarketing regulatory controls. A device is: "an instrument, apparatus, implement, machine, contrivance, implant, in vitro reagent, or other similar or related article, including a component part, or accessory which is: recognized in the official National Formulary, or the United States Pharmacopoeia, or any supplement to them, intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease, in man or other animals, or intended to affect the structure or any function of the body of man or other animals, and which does not achieve its primary intended purposes through chemical action within or on the body of man or other animals and which is not dependent upon being metabolized for the achievement of any of its primary intended purposes."²⁷

The FDA has appropriated other words as well. If a frequency equipment manufacturer uses the words "treatment," "disease" and "cure" in conjunction with their equipment—and the unit has not been approved by the FDA for medical purposes—then the manufacturer can be legally accused of falsely labeling a machine for medical purposes, and could go to jail.

Q. What can I expect to feel during a rife session?

A. There are several possibilities.

- ◆ *Changes in energy levels.* You may feel more relaxed or more energized. This primarily relates to the beneficial effects of many frequencies on cell metabolism and the normalization of tissues, independent of pathogen devitalization.
- ◆ *A Herxheimer reaction.* If a pathogen is being devitalized or deactivated quickly, you may feel the effects of a die-off (see the previous question, "What is a *Herxheimer* reaction?"). However, normally it takes several hours or even a day to experience this type of response. If your equipment is truly devitalizing or killing pathogens, you'll experience *less of a Herx reaction* the next time you use the equipment—assuming that your next session is within a few days. If you wait a week or longer between sessions, this will give the pathogens an opportunity to recolonize.
- ◆ *A physiological response.* You may respond to a certain frequency that feels like a "hit." Australian rifer and massage therapist Ken Uzzell defines a hit as "an immediate physiological response that the body generates as a result of a frequency."²⁸ Any notable sensation felt during a session could be a hit: itching, prickling or burning on the scalp and skin; watering eyes; the clearing of sinuses or runny nose; chest tightness; churning stomach; altered breathing; quickening pulse; tingling nerves; noise in the ears; pressure in the joints or muscles; and twitches (some of which might be focused in the feet or hands). You may simply have a vague sense that "something" is happening. Uzzell reports that users experience tingling at the site of tumors and fatty lumps that are being kneaded while his plasma device is running. Hits seem to be felt primarily when frequencies below 20,000 Hz are being used, because these are in the range of the nervous system. Jason Ringas, of the now-defunct Rife Research Group of Canada, once wrote: "When people talk about feeling a 'hit,' what they are describing is clearly a physiological response. There might also be an MOR effect taking place, but that effect can't be felt because when you're targeting an organism it takes time for it to clear out of the body and for the damaged tissue to repair. The audio frequency physiologic effect is very important in its own right, but it cannot be explained in terms of the MOR effect."²⁹

- ◆ *A negative reaction from the pathogens you're targeting.* You might be feeling bad because the pathogens you're targeting are feeling irritated instead of becoming disabled. "A surprising number of people," remarks scientist and equipment manufacturer Jimmie Holman, "misinterpret their reactions during and after rifting when they incorrectly assume that what they're experiencing is a Herxheimer or 'die-off' reaction. *When the Herx reaction is reported over and over again, at the same level*, it's unlikely that the intended die-off is occurring. Instead, what these rifers are experiencing *is the result of irritating a pathogen that is successfully fighting back*. This happens especially in the case of Lyme, when the spirochete is releasing its neurotoxin."³⁰
- ◆ *A negative response to the equipment you're using.* If your equipment is using an RF (radio frequency) carrier wave, or if there's another especially strong signal to which you're extra sensitive, your body could be metabolically disrupted. See the next page for instructions explaining how to tell if you're having a negative reaction to RF.

Royal Rife himself reported that subjects did not feel any sensations. However, his equipment was made very differently from modern machines, and it ran very high frequencies. If you don't feel anything while rifting, don't be concerned. What happens *after* the session is more important.

Q. What's the difference between a detox (Herxheimer) reaction from rifting and actually being sick? They feel similar.

- A.** On one level, it doesn't really matter *where* the symptoms are coming from when you're feeling awful. But there are important differences between the two as well as similarities. First I'll describe a Herx reaction, also known as a healing crisis, and then I'll define illness.

The symptoms of illness are the body's attempt to eliminate toxic debris. Fever is a strategy to literally "cook" pathogens to death, as most of them cannot survive above certain high temperatures. Coughing is a natural reflex of the respiratory tract to expel germs that have become embedded in the mucous membrane lining of the lungs. (The production of excess mucus itself is the body's way of trapping pathogens and other debris that might otherwise seep into the bloodstream.) By sneezing, the body tries to expel foreign particles (such as dust or pollen) that have migrated up through the nose. The throat feels sore from lymph nodes in the neck that have become swollen from the extra white blood cells they create to fight infections. Vomiting and diarrhea are the body's way of discharging poisons (spoiled food or dangerous chemicals) in the stomach. And an eruption of hives, boils or a rash signifies too much waste for the body (usually the liver) to handle internally, making it necessary for the debris to be expelled through the skin.

On Physiology, Fascia, and Rifting

Pathogens are probably the cause of some responses people feel during rifting. When the right frequencies are used on people suffering from *Candida*, colds and flu, the "hit" is felt strongly at the pathogen location in the body, and the symptoms totally fade from a few minutes for colds and flu, to a few days for heavy *Candida* infections. Hits can also be experienced at the site of cancer tumors and cells, although I wouldn't know if this response comes from the cancer cells themselves, or associated pathogens, mold and fungus present at the cancer site.

I have also observed fascial release in frequency sessions on friends. The fascia, a thin membrane encasing the muscles, can become traumatized, bound up and tight, restricting movement. During rife sessions, I have seen the fascia release trauma and thus function better—correctly hydrate again and instantly encourage a huge improvement of electrochemical and fluid movement within the body's pathways. I believe that this is a major contributing factor when people experience an almost instant normalization of blood pressure and a very fast return to health during massage. I also believe that this is the mode at work when we hear of miracle healings attributed to frequency therapy sessions. When deep and complete levels of fascial release occur, miracle healings are to be expected, as the body has huge resources to quickly combat disease.

The fascia is a good tissue for resonance and response, from a frequency session standpoint. A trained massage therapist can easily check to see if a major fascia trauma release response has occurred, which I have noted at times. From my observations, frequencies between 50 Hz and 1,000 Hz generate this release. As the bound fascia structures will always be different in the body (even different from day to day), the frequencies [that you need] may differ as well.

—Ken Uzzell, Australia
massage therapist and rifer, 2006

Thus, “symptoms” are merely the body’s ways of trying to eliminate what doesn’t belong in it. *Preventing the body from doing its job by trying to suppress fevers, coughing, sore throat, vomiting, diarrhea, rashes, sneezing, etc.*, can be counterproductive because many of the toxic waste materials will remain. Small amounts of living pathogens (or *their* waste materials) may exist at what’s called a “sub-clinical” level—too low to be detected by standard allopathic tests, but present in enough quantity to make a sensitive person feel unwell. Thus, when people try to alleviate or abolish “symptoms,” they’re usually halting a process that should have been allowed to finish, as long as the symptoms themselves aren’t life-threatening.

Back to rife sessions: when someone correctly targets one or more type of pathogen while rifting, even if s/he didn’t feel particularly ill before, s/he may feel ill now due to a detox response. Detoxification and illness often feel similar because *a detoxification response can result from an arrested disease*. When the pathogens that have remained in the body are finally targeted by the correct frequencies, we may feel as though we’re getting sick all over again: waste materials are released, causing the body to again go through an elimination cycle (sore throat, skin rashes, nausea, diarrhea, etc.).

A detoxification response can also result from *incompletely metabolized foods and incompletely discharged waste materials* that are unrelated to pathogens. Many people who go on a juice fast, or a simple diet of raw fruits and vegetables, experience uncomfortable, even painful symptoms such as nausea, runny nose or muscle weakness. The lighter diet

rests the digestive organs and evokes a cleaning-out response in the body as old junk gets pulled out of the fat cells and other tissues. Toxins—previously stored, and now circulating through the bloodstream—can make us feel worse if we can’t excrete them fast enough. This is why experimenters commonly take herbs, clay, activated charcoal, and/or protease enzymes to help bind and excrete toxins before the toxins can again migrate back to vulnerable tissues.

The line between a healing or detox response and a disease crisis is crossed when the body can no longer eliminate poisons, and begins to degenerate. During a healing response, the body rids itself of accumulated waste and then revitalizes itself. During a disease crisis, the body can no longer revitalize due to weakness or too many poisons, at which point medical intervention is required. See Sidebar, “Distinguishing a Healing Response from a Disease Crisis.”

Some people believe that if they’re not experiencing discomfort, then the rife sessions aren’t working. This isn’t true. Plenty of rifers get good results without undergoing what they perceive as a Herx.

Regardless of whether you’re experiencing a detox response or disease crisis, if pathogens are involved, they need to be disabled or killed. Frequency devices can also help restore cell function, which is why rifting is useful for many different circumstances.

Q. How do I know if I’m having a detox (Herx) reaction from rifting or if I’m feeling ill because of the RF from my unit?

A. Here’s a simple test:

Distinguishing a Healing Response from a Disease Crisis	
Healing Response	Disease Crisis
Person feels bad, but then feels better.	Person feels bad, with little or no relief.
The response occurs over a short period. A general rule is one month of healing for every year the person has been ill.	The response occurs over a long period. A health care professional can help assess how long is “too long.”
There is a retracing of prior symptoms, often from decades ago.	There is a continuation of prior symptoms, often with the addition of new ones.
Organs, glands, and the body in general function better.	There is wide-ranging degeneration of organs, glands, and perhaps the body in general.

- ◆ *Step 1.* Sit one to three feet from your RF unit. Run 10,000 Hz, a frequency that helps with cellular repair but doesn't kill pathogens. If you feel bad, you're probably responding to the RF.
- ◆ *Step 2.* Now you need to see if being farther away from the RF unit will help. Sit at least six feet (or seven feet, maximum) from the machine—again, keeping the test signal constant at 10,000 Hz. If you do feel better, you'll know that the RF is no longer affecting you negatively.
- ◆ *Step 3.* Now you need to know if the machine will be effective for you at the distance you selected. Did you feel better because no RF reached you, because of the 10,000 Hz signal—or both? To test whether a given frequency will reach you, sit at the same distance away from the machine (six to seven feet) and run a frequency that targets an infection you know you have. If your infection progressively dwindles, you'll know that the distance you selected is effective. Plus, you have just confirmed what you must do to safely use an RF unit.

Alternatively, if you have two machines—one that uses RF, and one that doesn't—you can perform this simple experiment. Sequentially run 10,000 Hz on each machine, sitting the same distance from each (between four and six feet). If you feel the same from both machines after 20 minutes or so, you'll know that RF doesn't negatively affect you. If you feel bad with the RF but good (or neutral) with the non-RF equipment, you'll know that RF signals don't agree with your system.

Q. Why do some people feel worse immediately after having a rife session, while other people feel better?

- A.** Assuming that you're not reacting to RF or something else related to the equipment, how you feel largely depends on the ease with which your body detoxifies.

During or after a rife session, you may feel better—lighter, clearer, less congested, a decrease in pain, or a partial or even complete elimination of symptoms. But you may also feel worse, depending on the amount of microbial die-off. Symptoms of die-off can closely mimic feelings of illness or detoxification. (They may also mimic some of the physiological responses felt *during* a session.) These sensations can include dizziness, moodiness and irritability, an inability to focus, fatigue, aching or swelling in muscles and joints, nasal congestion, churning stomach or nausea

(with or without cramping), skin rashes, a temporarily irregular heartbeat and/or quickening of the pulse, slower or faster breathing rate, watering eyes, and other signs that waste materials are being released into the bloodstream. If your urine has turned bright yellow (and the intensified color isn't due to excess vitamin supplements), this means that pathogens were killed and are being excreted as waste. Some people find large numbers of parasites or worms in their stool.

Mild toxicity can produce lethargy and headache. Moderate toxicity can cause nausea and vomiting. And severe toxicity can induce rashes or boils, indicating that there's so much extra waste material in the body that the excess is being eliminated through the skin, rather than being processed through other detox pathways (liver, colon, urinary tract). *These reactions indicate that the body is trying to eliminate poisons, rather than a sign of illness per se.*

Detox symptoms can be alleviated or eliminated entirely by drinking mineralized water. However, if your diet, stress levels and lifestyle are encouraging pathogens to proliferate, water alone will not quell the symptoms. You will need to evaluate what is allowing the pathogens to proliferate. Chapter 2 discusses the many environmental conditions that contribute to the recurrence of symptoms.

The part of the microorganism that was devitalized or killed may also play a role in how ill you feel. Some frequencies target a portion of the pathogen's DNA, a protein inside the cell wall. This devitalizes the microorganism and causes it to die slowly, over the course of days or even weeks. Other frequencies target its cell wall and cause it to shatter within minutes. When a harmful microorganism is simply being immobilized, the immune cells of the host's body can scavenge it whole. But if a pathogen's cell wall is broken, waste oozes out and circulate throughout the bloodstream—leaving much more poisonous material, and over a greater area, for the body to eliminate. James Bare's video (on the Internet, and featured in many films about Rife), which shows a paramecium being disemboweled and disintegrated from a plasma wave, is a good illustration of the mess that shattering can create. While dramatic, this manner of killing microorganisms suggests that a less rapid immobilization—while requiring more sessions—may be preferable, as it's easier on the body.

Are you spending enough time with your unit? You may need to approach your condition more aggressively, either by doing sessions more often or allotting more time per frequency.

Rifers typically experience changes during their first session or shortly afterward. Some people sense a shift in the first 10 minutes, but reactions can be delayed. As a general guideline, if you don't feel something within 6 hours after the rife session, you haven't used the correct frequencies. However, everyone is different, so responses will vary.

Be extra careful if you have a sluggish colon, kidneys, liver or lymph system; a history of long-term viral infection such as polio or Epstein-Barr; a chronic condition such as Candida or Lyme; or a potentially life-threatening cancer. Make sure that your organs of elimination can handle the sudden release of toxins into the bloodstream. (See Chapter 3, **Detoxification** for more information.)

Pace yourself according to the requirements of your condition, your intuition, and the advice of your health care provider. If you feel better after your session, you can do another one the next day. If you have an extreme negative reaction, wait until you feel tolerably better before rifeing again. This pertains to most conditions *except severe progressive illnesses like cancer*. If you have cancer, most Rife researchers agree to a protocol of rifeing twice daily to eliminate the spread of abnormal cells and ultimately reverse the condition.

Healing may not be so much
about getting better, as about
letting go of everything
that isn't you—all of the
expectations, all of the beliefs—
and becoming who you are.

at San Francisco School of Medicine
and Founder-Director,
Institute for the Study of Health and Illness
(born 1938)

Q. Due to a Herxheimer response, I cannot rife as often as I need to. How can I lessen or eliminate these detox reactions?

A. A *Herxheimer* response is a detox response, named after the doctor brothers who first catalogued it. Drink enough water! But—unless you need to drink a lot at one time, due to having exercised, sweated or been in a sauna—don't drink too much at once. Four ounces per half hour is the customary amount of fluid that the kidneys are able to process. Also, make sure you replenish your mineral supply because minerals will be flushed away with the water and the body uses more minerals than usual when it detoxes. See Chapter 3, **Water**, for more information about kinds of water and the desired mineral content of water.

In addition to trace minerals, make sure to obtain adequate amounts of magnesium, potassium, selenium, sodium, and zinc. All of these minerals should be chelated (bound), to another substance to make them

more absorbable (for example, calcium citrate, zinc gluconate, etc.). The major minerals are mostly used to process debris that can cause detox reactions. Brian McInturff has found that if a good quality salt, with all its trace minerals intact, is put into the water, that alone may be enough to supply the minerals necessary to fight the reaction. "I know someone," he says, "who used a frequency device to fight a large malignant tumor and suffered horrible detox reactions. He started using water with ever increasing amounts of natural salt until he found the amount that would quickly relieve him of his detox symptoms."³¹ (**Water** in Chapter 3 discusses the importance of drinking mineralized water daily, even when you aren't sick.)

One of my physician colleagues advises two grams of Vitamin C immediately before a session; 1 teaspoon of baking soda in water immediately after; and for the next 24 hours, as much homemade lemonade as possible, consisting of 2 tablespoons of fresh lemon juice and 2 tablespoons of maple syrup in 8 ounces of water. Sometimes a half teaspoon of cayenne pepper is added. He says that he has not seen a full Herxheimer reaction since suggesting this protocol. For clearing the digestive tract, some people take ¼ teaspoon to 1 teaspoon of Vitamin C powder with plenty of water.

The salt-and-C protocol has become popular among those with Lyme disease, but people with other chronic ailments have also reported benefits. The protocol consists of taking between ¼ and 1 teaspoon each of salt and Vitamin C every hour, 12 times a day, or as often as you can tolerate. Table salt without additives is okay to use, although many people prefer the healthier Celtic sea salt from France. Those who use salt and Vitamin C report greater effectiveness in eliminating pathogens and cleansing symptoms when both salt and Vitamin C are taken together than if only one or the other were used alone. The salt-and-C protocol is also discussed in Chapter 5, in the section on Lyme.

Enzymes also substantially lessen detox reactions, as they are used by lymphocytes (immune cells) to scavenge pathogens and clean up debris. In Germany, Wobenzym® (which contains pancreatic and other enzymes) are the most popular non-prescription anti-inflammatory. In addition to fighting pain, enzymes rebuild body tissues. When taken on an empty stomach, the enzymes go directly into the bloodstream

and are used for repair and immune support rather than the digestion of food. Virtually all enzymes can be taken safely in large amounts. Raw foods, especially fresh squeezed vegetable juices, are excellent sources of not only enzymes but vitamins and minerals.

Many different kinds of herbs and nutritional supplements can cleanse and stimulate a clogged or sluggish digestive tract, the kidneys, or liver. See Chapter 3, **Detoxification** for more information.

Q. If a temporary irregular heartbeat is one possible consequence of microbial die-off, how can this be distinguished from the medical condition known as arrhythmia?

- A.** According to Rife researchers, temporary irregular heartbeat may indicate not only microbial die-off, but also mineral depletion, because the body uses up its nutrient stores in the process of detoxifying from debris. The most basic minerals include magnesium and selenium (important to the heart), as well as potassium, calcium and sodium. It's very important to consume adequate amounts of these minerals, along with water—no matter what your condition, and especially if you have any heart problems.

Temporary arrhythmia may also indicate food allergies. If there's a history of heart trouble in your family, if you believe that there is a problem with your heart, or if you suspect that you have allergies, consult a health professional.

Q. How many frequencies should I use per session?

- A.** Use your judgment and common sense. Most people tackle the symptom picture that has existed the longest, is giving them the most trouble, or poses the greatest threat to their well-being or survival. Increase the number of frequencies until the desired results are achieved.

Q. For how long should each frequency be administered?

- A.** The short answer is usually 3 minutes per frequency, based on the performance of the average machine. However, this is a general guideline. There are many variables that influence the transfer of energy in the body (between cells and within the cells), and govern the body's response to the signal. These include:

- ◆ *The condition of the rifer.* This includes your stamina, body chemistry, diet (amounts of

nutrients and salts consumed), and resiliency and clarity of your detox pathways. You must keep your lymph channels moving, your colon clear, your liver unclogged, and your kidneys optimally functional. Drink plenty of mineralized water to flush the toxin load from your system. Additional detoxification protocols may be required, such as colonics, a liver or kidney cleanse, and sauna therapy (all explored in Chapter 3). Sometimes there's too much toxic debris for your system to handle. If you suspect you're too ill to handle a sudden onslaught of toxic die-off, consult a knowledgeable health professional. If your diet has played a role in supporting the proliferation of harmful microorganisms, change it.

- ◆ *The severity of your condition.* Sometimes an illness is so severe and debilitating that you need to start slow. This is especially true with Lyme. Many researchers advise caution, doing initial sessions of no longer than 15 *seconds* per frequency. For sensitive people, including those with Lyme, 10 minutes a day or less is sufficient until they're stronger.
- ◆ *The urgency of your condition.* When an illness is life-threatening, the need to shorten the rife sessions due to systemic toxicity becomes secondary to the need for an aggressive approach that could save your life. This is especially true with cancer and similar conditions that cause rapid degeneration. With most equipment, people use 20 or 30 minutes per frequency, and sometimes a full hour. (The longer sessions, typically for cancer, are usually divided into two equal sessions with at least a 4-hour break in between.) Please seek supervision from a health practitioner who can help you clear your detoxification pathways and closely monitor your response to the frequencies.
- ◆ *The penetration ability of your machine.* Radiant units typically require less time per frequency than electrode units. The most effective plasma machines suggest 1 to 3 minutes per frequency. For cancer, I'd use much longer periods for difficult conditions like cancer (at least 30 minutes per frequency, and preferably a full hour). Most electrode devices require more time per frequency—at least 3, and up to 10 minutes per frequency, to ensure that the signal saturates the body tissues. The exception to this time frame is the electrode unit equipped with an optional RF carrier wave amplifier (the GB4000), which drives

the signal into the body more deeply and more quickly. Another exception may be the hand-held radiant plasma unit (the BXC Ultra). The Pulsed Technologies radiant plasma units usually require less time as well, due to their spiked waveforms.

- ◆ *The body's resistance and the pathogen's response to the signal.* The body may become resistant to a steady signal that's being emitted for several minutes or more. Similarly, a pathogen can mutate and thus require a slightly different frequency than the original number given. This is a good time to use the gate feature of the machine if it has one. See the discussion on gating earlier in this chapter.
- ◆ *The time of day that you are rifting.* I don't recommend that people rife at night because the body is meant to repair itself during sleep—which is difficult to accomplish if there's extra microbial waste to process. Also, when you're sleeping you can't drink water. If there's too much waste in the bloodstream you can awaken in the morning with an awful headache. However, not everyone agrees with me; some people do very well when they use the machine before bedtime or even during sleep. This circumstance varies between rifers, and even with the same person over time.

Rifing (as with real medicine) is both a science and an art. Royal Rife recommended no more than three minutes per frequency, but this was based on his machine. Today's equipment and increased chemical and microbial loads require longer session times, as well as a greater number of frequencies.

People's responses to the technology are unique. Here's an account from one creative rifer. "Usually, on the basis of what Royal Rife himself recommended, I run frequencies for no more than three minutes. I found that this was sufficient until I had a problem: certain frequencies aggravated the very conditions they were supposed to be helping." Realizing he had nothing to lose, he decided to flood his system. "I turned on the machine and let it run without limiting myself with time," he reported. "I did household chores while the unit was on, so it didn't interfere with what I needed to do. By dealing with my condition in this manner, I got better in a very short time."

This approach can backfire, though: sometimes rifing aggravates conditions. An experimenter ran some frequencies that elicited so much toxic debris that she developed arthritic symptoms. When the symptoms did not improve with the use of arthritis frequencies, she stopped using the equipment, drank

more water, and took some nutritional supplements. Once her pain abated, she resumed rifing. She observed what was happening to her, and then used her intelligence, logic and intuition to formulate and implement a plan that worked for her.

A long enough period of time with any protocol for one person may be too short for another, and vice-versa. *Everyone is different.* Monitor your responses and adjust your protocol accordingly.

Q. How many days should I allow between sessions?

- A. This depends on your situation. Here's a good general guideline: If you experience uncomfortable symptoms of toxic die-off, wait until the reactions abate before beginning your next rife frequency session—especially if your daily functioning is severely impaired or you have a particularly weakened immune response. This may mean rifing every third or fourth day. *However, Rife researchers agree that if you have a condition like cancer, a growing tumor requires a much more aggressive approach.* People with cancer usually rife themselves twice a day, each session consisting of up to 2½ hours. If you have any questions about how fast you should be going, consult a qualified health care practitioner.

Handling detox reactions properly during a serious illness is critical. In some instances, severe detox reactions impede healing. Make sure you have adequate time to recover from the effects of the microbial die-off. For some people this might be a couple of hours; others may need a couple of days. You won't know how much "recovery" time you'll need, especially when first experimenting with sessions. Therefore, allow yourself at least one day where your presence elsewhere isn't essential, so you can see how you feel from the rifing. The more experience you have with this technology, the better you can pace yourself.

Q. After I'm free of symptoms, for how long should I continue the sessions?

- A. For common ailments that aren't too severe, stop when you feel completely well. If you want to make sure that you eliminated all the pathogens, give yourself a few more sessions, perhaps every other day or every few days; there's no definitive rule about this. For stubborn conditions such as Lyme disease or so-called terminal illnesses like cancer or leukemia, most researchers suggest continuing on a similar maintenance program for four months to perhaps a year after all symptoms have disappeared. Use your judgment and experiment; each person is different.

Q. I'm elderly, and very weak from being ill for so long. How should I proceed?

- A.** Anyone old or young who's severely debilitated—from an infection or degenerative condition, acute or chronic—should begin with the organ and tissue support frequencies before dealing with pathogens. You can find them under the alphabetized listing **Regeneration and Healing** in Chapter 5. Although 40,000 Hz is the main or overall “master” healing frequency, there are other frequencies specifically for various organs, glands and even bone repair. Depending on your condition, you may need to use the tissue support for several days or even weeks before you embark on a protocol designed to debilitate pathogens. If you have questions about your suitability for rifeing, consult a holistic medical practitioner who can help you strengthen your system before embarking on a detox or pathogen-killing protocol.

Q. Can I address more than one condition at once, or should I use my device for different conditions on alternate days?

- A.** This depends on why you're using the equipment. If you desire more vitality but aren't severely debilitated (see above question), run a session for both tissue regeneration and pathogen devitalization. Start and end with the regeneration frequencies.

You may also need some detox frequencies. If you find them too stimulating, reduce the number of minutes you use them, the regularity with which you use them, or both.

What if you're dealing with two separate conditions or infections? Try the frequencies for both in one long session. However, if you have Lyme—which is often present with co-infections such as Babesia and Bartonella—you may have to deal with one infection at a time. Begin slowly, due to die-off. Remember to drink plenty of water to flush out the toxins.

Pay attention to how you feel. This will help you further customize your protocol.

Q. Can I rife after eating or drinking?

- A.** Extra water is needed to flush out toxins, so drinking extra fluid before or during sessions is not a liability. Eating, however, is a different matter. Digestion slows the detoxification process. The body generally starts to detoxify as soon as the frequencies are administered. The body can't put its energy into cleansing when it's busy digesting food, so one or the other (or both) may suffer if you rife on a full stomach. Eating and rifeing

can cause nausea from the toxins and killed pathogens that start flooding your system. Therefore, it's optimal not to have a heavy meal in the stomach while rifeing—although you don't want to be distracted with hunger, either, so eat something if you need to. It usually takes about two hours for food to leave the stomach after it has been eaten.

Q. Should I wear special clothing for the sessions?

- A.** With a pad device, the frequencies usually enter the body through the hands and/or bare feet. With a hand-held plasma tube unit, the frequencies are activated when the tubes touch bare skin—generally the hands, but sometimes people slip the tubes inside their shirt or pants. Frequencies from a freestanding plasma light unit can penetrate clothing and go right into the body.

For all types of machines, your clothing should be somewhat loose. This provides direct access to body areas if necessary, as well as maximum comfort during your therapy. Some people with external tumors expose their skin directly to the light. Although the radiation from a plasma light tube does penetrate clothing, it may work better (depending on the equipment) not to be covered with piles of blankets. Make sure the room is a comfortable temperature for you so you can wear light clothing.

Q. Can I wear metal jewelry or glasses?

- A.** Remove all metal jewelry if you're using an electrode unit. Metal conducts electricity. If you're wearing a ring or bracelet and they contact the electrodes, you'll get an uncomfortable shock.

By the way, some people feel more comfortable removing their metal-framed glasses. Health practitioners who do kinesiology (muscle testing) find that metal touching the body—especially if it cuts across the face or the center meridian (“Conception Vessel” in Chinese medicine) that divides the two body halves—has a weakening effect on the system. This is why many people report feeling more energized after they replace their metal eyeglass frames with plastic.

Q. Should there be special lighting, temperature or moisture for either the machine or me?

- A.** For any electronic device, extremes in temperatures and high levels of moisture may adversely affect the equipment. For you, very hot or cold temperatures or lots of moisture won't interfere with the sessions, but it's better if you're comfortable.

The type or degree of lighting shouldn't make a difference to the machine. With radiant plasma, it's the electromagnetic field, and not the illumination, that's doing the job. Use whatever lighting is comfortable.

Q. Can I run my equipment at night?

A. Rifers differ on this point. Generally, I believe that it's better not to rife in the evening for these reasons:

- ◆ *Sleep time is used by the body to repair itself.* If the rife session pushes the body too hard with excessively high levels of immune and detoxification activities, you may not feel rested.
- ◆ *Extra microbial waste (die-off) could irritate the nerves and keep you awake.* Conceivably, the waste could also negatively influence dreaming.
- ◆ *You cannot drink water while you're sleeping.* Seven or eight hours of not being able to flush out your system with water may allow the toxic load in your body to accumulate. Thus, the following morning you may feel awful with a headache, dry mouth, aches and pains, or other symptoms.
- ◆ *Some people report feeling energized by the equipment.* This is probably due to the increase in metabolic processes catalyzed by the frequencies.

That said, some people prefer rifting at night and benefit greatly from it. One woman told me that whenever she runs her plasma unit at night, she sleeps particularly well (despite the extra illumination from the light tube). A physician, who suffered from Lyme and Lyme-induced insomnia, told me that she had the best sleep in years after running 40,000 Hz all night. Bryan Rosner, author of several books on Lyme disease, confirms that many Lyme sufferers prefer rifting at night because it helps them sleep. And a physician recently reported that he and his wife have run their machine all night for nine hours over the course of a year and a half, and they always enjoy restful, uninterrupted sleep with only positive results.

Everyone's different. Experiment to see what works.

Q. With my electrode unit, do I have to feel the current in order to know that the machine is working?

A. The "power control" on a frequency device increases the *amplitude*, or *height of the wave*, thus sending more voltage through the body. *Voltage* is the *force* with which the electrons are being sent, and is experienced as the *intensity of the signal*. Some people, believing

that more is better ("no pain, no gain"), increase the signal intensity so much that they feel pain. But you don't need an excessively strong signal for the frequencies to be effective! In fact, if the signal is strong enough to cause pain, the body will become impervious to the signal. It's sufficient to feel a mild tingling sensation. If you experience pain or discomfort, or if your muscles start to twitch, the intensity is too high. The body may become resistant to the frequencies if the signal hurts or is too forceful.

Any current above 10,000 Hz oscillates so rapidly that most people cannot feel it even if the voltage is high, but frequencies below 10,000 Hz are commonly felt. Turn down the power when you switch from a higher to a lower frequency so you don't jar your system. Even if the amount of voltage remains the same, low frequencies such as 9.6, 20 or even 95 Hz subjectively feel stronger than the higher numbers set at the same intensity. (This phenomenon occurs because the waveform of low frequencies is larger than that of higher frequencies. See Appendix C, "Healing with Electromedicine and Sound Therapies," for more information on waveforms and their characteristics.)

If the frequencies skip around, you may experience an abrupt, sharp, prickly jolt when the machine stops transmitting a high number and suddenly skips to a lower one. Therefore, because of how the body perceives lower vs. higher frequencies, many people program the frequencies sequentially from the smallest number to the highest number. As your program transitions from lower to higher frequencies, you can increase the power gradually if you wish.

Whichever system you use when working with an electrode unit, the current will penetrate your body more deeply and more quickly if you wrap the cylinders in wet paper towels before holding them—or use another "wet" method of applying frequencies, such as wet towels on foot plates, or using alligator clips on the two wires coming from the unit, and attaching them to separate pans of water for the feet.

Q. I have a serious wound that I want to treat. Can I put an electrode directly on it?

A. An open scab or wound contains moisture. If touched by an electrode, the water in the raw flesh will conduct electricity much more efficiently than dry skin, and cause discomfort or pain. Therefore, don't apply electrodes (or electrode patches that stick onto the skin) directly onto a scab or wound. Bandage the wound. Place electrodes on either side of the wound (to focus current where it's most needed) about two inches

from the edge of the wound, and gradually move them closer as long as the sensation is comfortable.

Q. Is it true that the metal in the electrodes can get into the body? If so, what can I do to minimize harm?

- A.** It's true that the body can absorb toxic metals from metal electrodes. Electricity sent through metal causes a phenomenon known as *electrolysis*, wherein electrons break off from the metal and migrate into the surrounding area. For this reason, copper pipe electrodes should not be held directly. Stainless steel electrodes probably emit fewer metal ions during use. Gold plating is sometimes favored, although it's expensive. If you have any type of problem with toxic metal accumulation, cover the metal electrodes according to the instructions immediately below. (You might obtain better results as well.)

Q. I use an electrode unit. How can I ensure that the signal is getting into my body?

- A.** Dr. Richard Loyd discovered that the signal penetrates the body much more quickly (and perhaps more deeply) if the electrodes are surrounded with either (preferably organic and undyed) cotton fabric or (preferably unbleached) paper towels that are saturated with salt water. Dr. Loyd's clients report a faster elimination of symptoms if they hold electrodes (or place their feet on electrodes) that are wrapped in wet paper towels or cloth. As water is a great conductor of current, you'll have to lower the power setting of the unit.

Q. Can I use WiFi while I'm using the equipment?

- A.** With WiFi technology, electronic devices—such as a laptop, “smart” meter, iPhone or eBook reader—can connect wirelessly to the Internet, via radio waves in the range of 2.4 GHz. (As of this writing, there are plans to use even higher signals of 5 GHz and more.) Rife machines don't utilize those high ranges, so the WiFi shouldn't interfere unless a particular frequency resonates in those higher harmonics (which is doubtful). However, interference is a minor issue compared to the extreme danger of WiFi radiation! I strongly advise against using it.

Today, almost everyone uses WiFi; so even if you don't have a wireless network in your home, you're probably being bombarded by a 2.4 GHz (or higher) signal—from your neighbors, or in a public space such as a coffeehouse or library. Nevertheless, you can minimize or entirely eliminate the effects of this

dangerous radiation. For details, see the Chapter 1 Insert, pages 11–16, “Electromagnetic Fields and Your Health.”

Q. Can I do other therapies along with the rife sessions?

- A.** I can't think of any holistic therapy—acupuncture, bodywork, colonics, herbs, homeopathy, meditation, nutritional supplementation, ozone therapy, saunas, etc.—that would be incompatible with rifting. If you have any questions about the suitability of a protocol, consult a holistic health care provider. Chapter 3 contains detailed information on modalities that can complement your frequency sessions.

Q. Do I need a special diet or nutritional support while rifting?

- A.** Most people are missing vital nutrients because they eat the wrong things (and often, too much of the wrong things). Refined carbohydrates, grains, blood sugar-altering sweets, and junk loaded with chemicals, preservatives, and dyes create illness rather than wellness. See Chapter 3, **Food** for information on real food versus fake food, and the different types of food plans that people can use when they're ill.

When rifting, it's best for the body to focus on eliminating toxic materials instead of digesting food. As some people respond to the presence of microbial wastes with nausea and even vomiting (a classic detox response), it makes obvious sense to not have a stomach full of food. Two hours is the average time it takes for the stomach to become empty. However, don't wait too long after eating to do your rifting, either, because you might become overly hungry mid-session.

I have already mentioned the need for extra water and minerals. Briefly, rifting requires enough water to flush out the microbial poisons. The amount of water needed depends on how much high-water-content food is eaten; but an overall recommendation for the average adult is about 2 quarts per day. However, drinking that much water may flush out the water-soluble B vitamins and Vitamin C, along with minerals (especially potassium, sodium, calcium and magnesium). Therefore, you'll need to replenish them. Consult a knowledgeable health practitioner if you have questions about your requirements.

Nutrient needs increase during illness, with or without rifting. See Chapter 3, **Nutritional Supplements**.

Q. I'm doing many complementary therapies in addition to rife sessions. How do I know which protocol is helping me?

- A. Unless you have access to sophisticated electromedical diagnostic equipment or are being monitored by a holistic health practitioner, you may not know which therapy among several is the most helpful.

It's reasonable to want to eliminate repetitious or unnecessary protocols, especially if they're costly and time-consuming. However, there are many facets to health. Several approaches are usually needed, as they all provide complementary support. Understanding the *functions* of the different therapies will help you decide which ones you need and which ones you don't need at a given time. Generally, however, major lifestyle changes are mandatory. These include proper diet and exercise, suitable sleep, avoidance of chemicals and electrosmog, and psychological stress reduction.

Q. My partner is ill, and uses a radiant plasma machine daily. Will my children or I be negatively affected if we're in the same room?

- A. Many of the frequencies are for the Mortal Oscillatory Rate (MOR) of pathogens, while others solely enhance cellular function. Still other frequencies appear to both negatively affect pathogens and benefit body tissues.

If you're harboring a pathogen whose MOR is being transmitted by a nearby rife unit, that pathogen will be affected by the machine's field. Therefore, you may experience a die-off reaction (within 24 hours): thirst, nausea, fatigue, weakness, or another indication that a detox process is occurring. If you're *not* harboring pathogens that correspond to the MOR being emitted, then being near the device will simply have no effect and you won't experience detox reactions.

On the other hand, frequencies that help normalize or add energy to body tissue may have an effect—albeit a beneficial one. You may experience increased energy or an augmented feeling of well-being.

If you're using radiant plasma equipment and there are other people or animals in the room who should not be rifed, keep them out of the room. The checklist of candidates for rifing is at the very beginning of this chapter. If you think that others could benefit from the frequencies, even as “incidental recipients,” treat them as you would any other rifer. Monitor their responses and be prepared for possible detox reactions. Make sure they drink enough water to handle the effects of microbial die-off, should they experience this. And ask them if they feel better from the rifing.

Q. Rifing with my radiant plasma device helped me eliminate a cold. My daughter, who also had a cold, said that she felt the signal when she was in the next room. She's no longer sick. Can the frequencies really penetrate a wall?

- A. Some radiant plasma units are powerful enough to send their signals through walls. Even though the gases in the tube light up to produce the frequencies, it's the resulting *electromagnetic field* (what some rifers call the “field effect”) that conveys the healing, not the luminescence from the light when the tube is on.

The human body transmits and receives many different kinds of EM fields. Years ago, when I had a plasma unit equipped with two hand-held glass cylinders, several people reported feeling its energy about 8 feet across the room as soon as I activated the tubes by picking them up. On other occasions, a very sensitive woman could tell as soon as she entered the room that a (different) plasma device had recently been turned on. Sometimes people can feel signals from rife machines through walls or sense “after-images” from lingering radiation, even over longer distances.

Q. How do I use the stimulating and normalizing frequencies?

- A. There's a difference between frequencies (or substances) that normalize or regulate, and those that stimulate. *Normalizing* or *regulating* an organ or gland calms it if it's overexerting, and gives it more energy if it's lethargic. However, *stimulating* an organ or gland increases its output of activity. Whereas depleted body parts may benefit from carefully applied stimulation, organs or glands that are already overworking should not be forced into more activity. The few frequencies that appear to be stimulating to various organs or glands (as opposed to simply normalizing) may have an unwanted effect on you if you do not want that particular body part to be stimulated.

As always, pay attention to how you feel and stop rifing if it's not helping your overall wellness.

Q. Does it matter which direction the light tube is facing?

- A. People can be affected by the plasma tube's energy field regardless of the direction in which the tube is facing. However, you'll probably get a stronger effect with a directional light. The tube on most units has a piece of metal across one side that acts as a reflector. Face the portion of the light toward you that isn't covered by the metal.

Q. What if I don't get any results from the frequency sessions?

- A. See the Insert at the end of this chapter, "A Short Course on How to Give Yourself a Rife Session." It suggests what to do if you're not getting results.

Q. I was getting very good results when rifting for a chronic condition until I took a two-week break. Now the same frequencies don't seem to be working. Why?

- A. There are two possibilities. One, you may have given the pathogens a chance to become resistant to the frequencies. The few remaining hardy stragglers could have changed their rate of oscillation so that frequencies which used to work no longer match the current MOR of the pathogens in your system. Two, the rifting did such a good job at reducing the microbial load that you're no longer infected by the pathogens.

If your machine has the capability, run a converge or a sweep to address possible mutations. Also try different frequencies. This situation illustrates the importance—especially for those with chronic, difficult or life-threatening conditions—of doing Rife Therapy consistently for longer periods of time.

Q. Can the frequencies in *The Rife Handbook* be converted into radionics rates? If not, what's the difference between rifting and radionics?

- A. *Radionics* is a healing modality characterized chiefly by intent, and is sent over a short or long distance. Anything can be sent radionically: essential oils, herbs, vitamins, minerals, good wishes, bad wishes, a desire for healing or harm, or frequencies emitted by a rife machine. Radionics is one form of non-local, *subspace* healing (see Chapter 6). Quantum physicists refer to connection at a distance as *quantum entanglement*. In quantum experiments, subatomic particles that are connected remain connected, even when separated by thousands of miles. An act performed on one particle affects the other. This is true in the macrocosmic world as well, with biological materials. In one study, white blood cells were taken from a subject and put into a Petri dish. The subject was attached to electrodes and shown an upsetting film. He felt anxiety, which the electrodes recorded. Miles away, in another laboratory, his white blood cells registered the same electrical activity at the same time.

A radionics *machine* is designed to send information in the form of energy to someone else. The person can be in the same room or across the ocean. The radionics

practitioner places a client's photo, saliva sample, lock of hair, a speck of blood, or some other representation (called a "witness") in a chamber of the radionics machine. A vitamin, mineral, herb, etc., is placed in the machine with the witness. Then the energy of the healing substance is sent to the person via subspace.

Radionics machines work on a completely different principle than rife units. They may use numbers called "rates," but these rates are not the same as frequencies that are measured in hertz or multiples of hertz. Rates are arbitrarily assigned numbers—reference points for the equipment operator—and each radionics machine manufacturer uses different rates. The operator's skill determines the rates (and success of the sessions).

On the other hand, the frequencies used during rifting *can* be used radionically. Put another way, Rife Therapy can be sent subspace, and rife machines can be used radionically to convey frequencies.

Here is a true story. Several years ago, I was contacted by an avid rifer whom I will call Jane. Jane had been giving long distance rife sessions to a friend with the flu. She wrote his name on a piece of paper, pinned the paper onto her shirt, and held the electrodes of a rife machine. Essentially, she was giving herself the same session she would have given him if he were physically present. The problem is, by helping him in this manner Jane was not only assuming the identity of her friend, she was also taking on his condition! Jane's friend got well, but she was coughing and sneezing and even had a fever—the very symptoms that she had eliminated in him.

Factors Influencing Us as Empaths

- ◆ **Receiving.** Our sensitivity as receivers will factor into how much energy we pick up.
- ◆ **Sending.** Some people transmit their energy more strongly than others, and the depth of the emotions that they are experiencing will also turn up the volume that they are sending out.
- ◆ **Awareness.** The unaware person may be just as sensitive as the aware person. The latter will understand why they have mood swings; the former will not.
- ◆ **Emotional Connection.** The stronger the emotional connection is, the less important the physical proximity is.
- ◆ **Physical Proximity.** Neighbors and strangers will influence us based on physical proximity. This is true for the people living in our neighborhood and the strangers we brush up against in the shopping mall.

—Trevor N. Lewis and Abbigayle McKinney
excerpted from *Thriving as an Empath*, 2016

Jane wanted to know how she could avoid becoming ill while giving surrogate sessions to her friends and family. I told her that she did not need to pin the names of other people to her own body. Nor did she need to even be in the same room while the frequency device was operating, especially because she already had such a powerful intent. I advised her to place either her friends' photos, or papers with their names on them, on the footplates attached to the actively running unit. Or, she could place the photos or names next to the plasma tube while it was running; it didn't matter.

At first Jane sat right next to the machine when she gave sessions. Once she was satisfied that her friends were receiving the healing, she allowed herself to do other things while being in the same room as the machine. Soon she felt comfortable switching on the machine and letting the frequency programs run while she left the room or even the building. Obviously, this woman felt very connected to her friends.

Three fascinating books that explain the physics of intention and various energetic therapies, along with lots of cutting-edge scientific data and the history of the scientists, are *The Secret Life of Plants*, *The Field*, and *Psychic Discoveries Behind the Iron Curtain*.

Frequency Selection and Pathogen Response

Q. How do the frequencies work?

- A. The frequencies harm pathogens, benefit the body, or both. First I'll discuss the effects on pathogens.

A popular film from James Bare (which is often included in documentaries on Rife and shown on many Internet sites) depicts a protozoan through a microscope as it's being exposed to a Bare-Rife machine emitting a 1150 Hz signal with an RF carrier wave. In fewer than 15 seconds, a portion of the protozoan's membrane is punctured and its guts explode. However, the shattering of a microorganism, although visually dramatic and compelling, doesn't actually explain how frequencies disable it. Simply put, the frequency equipment matches wavelengths, or *resonance*, with the pathogen. This transfers electrons (energy) to the microbial cell wall. The increase in energy disturbs the pathogen's electrical charge, *changing its shape and pattern*—its structural integrity. This causes *electroporation*, or a bursting of the pathogen's outer layer, which is why its innards spill out. When a pathogen's structural integrity is compromised, it destabilizes rather than shatters.

The disruption of the electrical charge on or inside the microorganism can:

- ◆ Disable certain proteins.
- ◆ Devitalize certain enzymes.
- ◆ Disrupt the pathogen's ability to metabolize.
- ◆ Disrupt the pathogen's ability to replicate.
- ◆ Disrupt the pathogen's ability to reproduce.
- ◆ Disrupt the pathogen's ability to recombine.

Independent of killing or disabling noxious microorganisms, some frequencies benefit the body because they normalize or stimulate various organs, glands, tissues or body functions by:

- ◆ Beneficially reorganizing the RNA/DNA.
- ◆ Making the flow of ions across cell membranes more efficient.
- ◆ Increasing the number of stem cells (which speeds healing).
- ◆ Focusing the immune cells on a pathogen that was not previously recognized as a threat.

The recently deceased Dr. Robert P. Stafford, who had worked with Royal Rife, John Marsh and John Crane, believed that the frequencies stimulated the adrenal glands and may have had other immune-enhancing properties. Perhaps the signals cause or speed the leakage of unhealthy cells, thus encouraging their removal. (Normally, when cells start to die from old age, infection or disrepair, fluid leaks out of their membrane. Immune cells recognize this leakage as a message to scavenge what is now waste.) *Blast It!* author Carol Nichols, drawing on many years of experience with pad devices, writes that electrode units in particular "have a unique ability to stimulate atrophied muscle tissue, increase circulation of blood and lymph, stimulate regeneration of damaged nerve pathways, and rectify low tissue conductivity."³² Peter Walker, who reports on rife technology in Europe and also highlights pad devices (which are extensively used by European doctors), writes, "Pad devices have a positive effect because they can tonify the body and help improve its energy levels. Plasma units are great for killing parasites."³³ And the late engineer Aubrey Scoon believed that "magnetic and electric fields are inducing electrochemical changes in cell membranes which affect electrochemical pumping mechanisms."³⁴

Any electromedical device that causes the electrical charge of a cell to improve will assist with healing. Cells and other structures that are too weak or diseased to contain the charge that a healthy cell can hold, will

lose their structural integrity and become part of the body's waste load (as they should). And pathogens that absorb too much energy (more than they can hold) will undergo a similar fate. A healthy body whose cells have the proper resistance, capacitance, and inductance—simply put, are functioning correctly and have the proper electromagnetic signature—will be more impervious to pathogens, and will perform their jobs more efficiently.

At some point, you may hear researchers talk about the *rife effect*. This effect can be any or all of the effects just described.

Q. How were the frequencies in *The Rife Handbook* calculated?

A. The frequencies are from several sources. These include:

- ◆ *Royal Rife's Original Lab Notes*. Fourteen frequencies listed in the Frequency Directory (Chapter 5) are believed to have been used with Royal Rife's #4 machine. These frequencies correspond to some common microorganisms such as *Bacillus anthracis*, *Clostridium tetani*, *E. coli*, *Salmonella typhi*, *Staphylococcus*, and *Streptococcus*.
- ◆ *In Vitro Studies*. Researchers view pathogens on microscope slides or Petri dishes to see how they respond to various frequencies. For example, in experiments in Romania supervised by Jimmie Holman and Paul Dorneanu, pathogens were cultured, exposed to different frequencies, allowed to incubate, and then meticulously counted so the rates of slowed or stopped growth could be calculated. For experiments on living pathogens, researchers use either a dark field microscope that reveals larger pathogens such as bacteria, or the higher powered Ergonom that can reveal tiny viruses (see below).
- ◆ *Live Blood Analysis*. This is done with a *dark field microscope*, which uses a glass slide immersed in oil to better illuminate the features of a living specimen. During a live blood analysis, a specially trained microscopist examines freshly drawn, living blood before and after a subject has been exposed to various frequencies to see which ones were effective. The blood is examined for pathogens and debris. The shape, motility, functioning, and clustering (or not) of the red and white blood cells are also examined. For viewing blood, a dark field microscope doesn't need to be as high-resolution as a Rife or Ergonom microscope.
- ◆ *Muscle Testing or Applied Kinesiology*. This method was developed in 1964 by Michigan chiropractor George Goodheart. The practitioner pushes or pulls on parts of the body—usually fingers or an extended arm—and, based on the muscular weakness or strength, determines the client's allergies and conditions. Later practitioners include John Thie (author of *Touch for Health*), and John Diamond (author of *Your Body Doesn't Lie*).
Related modalities include Touch for Health and Contact Reflex Analysis (CRA). The tester exerts pressure on reflex points in the body to obtain information. All these methods have been used to determine which frequencies the subject needs. This method is related to dowsing, below.
- ◆ *Dowsing*. This method uses a *dowsing rod*, which is a stick of metal or wood, or a *pendulum*, which is a weighted ball or other object hanging from a cord or chain. These low-tech instruments amplify the electrical signals in the nervous system and externalize them into muscle movements, similar to movements that are detectable through Applied Kinesiology or muscle testing. Dowsing can be performed by both the subject and an experienced tester who links to the subject without necessarily physically being in the same location. With dowsing, unlike Applied Kinesiology, the subject uses an external object instead of the body to detect the responses to a frequency or substance. Some people find dowsing very effective to find frequencies. Even though dowsing is not respected in some circles, it actually has a scientific basis. See Sidebar on page 576, "Dowsing and Muscle Testing."

Prominent rifers who have found frequencies include:

- ◆ *Richard Loyd, PhD*. Working in a clinical capacity, Dr. Loyd uses muscle testing to find frequencies for a great number of conditions. He further refines these frequencies to determine which ones work best, relying on reports from his clients and occasionally their lab tests. These numbers, along with listings for new conditions, are offered and always updated at royalrife.com.
- ◆ *Hulda Clark, PhD*. The late Dr. Clark used a testing device that she developed called a *synchrometer*. Many rifers use her frequencies (which are also listed in this *Handbook*). You can find plans to build your own synchrometer, inexpensively, at synchrometer.com.

Dowsing and Muscle Testing

You turn on the machine and select a frequency. "Is this a good frequency or not?" you wonder. One way is to see how you feel after running it. But if you dowse or muscle test, that's another way.

You can use a dowsing tool called a Bio Tensor Adjustable Rod. You can also use your fingers or arm or a pendulum. The frequency of whatever you're testing will strengthen or weaken your electromagnetic energy field.

You can train yourself to learn. Basically keep an open mind to find out, "Is this good or bad? What's this frequency going to do?" It's best to ask questions that can be answered with a "yes" or "no." I don't ask weird questions like, "Am I going to have a baby boy or a girl." I just find out if there's a positive or negative response to a given field.

To have a baseline comparison, take something you know isn't good for you, like aspartame or sugar, and hold it next to your body. Your response should be negative: your muscles will be weak. Then find something that's good for you, and your response should be positive: your muscles will be strong. Now you know your negative and your positive.

This is how I conducted my Multiple Sclerosis research from 1999–2000. The program was designed to facilitate nutrient uptake at the cellular level. Which nutrients and frequencies should I choose? I gave the subjects nutrients based on lab work that identified deficiencies, but the frequencies for neurological function were chosen through dowsing. Everyone got better.

How does it work? Every substance in the universe has its own resonant frequency. Your body has a whole catalogue of frequencies it's transmitting and receiving. When you put a substance in proximity to your body, there's going to be an interaction. It's called a "destructive interference field" or a "constructive interference field." Your nervous system is a sensor. Your fine motor control is unconsciously controlled by your brain stem and spinal cord. When you know how to properly dowse or muscle test, you'll get a clear response if you get your conscious mind out of the way. You'll get a positive or a negative. You're using your own body as a sensing tool to evaluate whether or not this particular frequency is healthy or good for me—and also, how long should I be running it.

This is why dowsing and muscle testing have a scientific validity.

Rife Frequency Therapy, Electromedicine,
and Holistic Health conference
October 8–9, 2016 in Phoenix, Arizona
(DVDs available at nenahsylvr.com)

- ◆ *Jeff Sutherland, PhD.* After extensive experience with the F-Scan (which detects frequencies with which a subject resonates), software inventor and National Institutes of Health grantee Jeff Sutherland developed a method to find frequencies for specific organisms and various mutated cells with a sensitive dowsing instrument called the Cameron Aurameter. Cross-checking the frequencies obtained from the Aurameter with those obtained from the more mechanically objective F-Scan, he combined these two approaches into a single diagnostic tool. He offers frequencies for many conditions at frequencyfoundation.com.

In Chapter 5 of this book I include only a handful of Dr. Sutherland's frequencies that are already in public domain. For a much more extensive repertoire of frequencies that you can purchase, see his website.

- ◆ *John Garvey, LAc. and Marty Monahan, DC, NMD.* Acupuncturist, homeopath and rifer John Garvey calculated some very effective frequencies which he publicly released in 1993. Dr. Garvey's frequencies are in this *Handbook* (and also in Brian McInturff's Consolidated Annotated Frequency List or CAFL, newer versions of which are sold online). Chiropractor and naturopath Dr. Marty Monahan, partnered with Garvey before the latter retired, provided additional frequencies that he has tested in his practice in Florida, US.
- ◆ *Jimmie Holman and Paul Dorneanu of Pulsed Technologies.* *In vitro* studies; see page 575. Their studies are scientifically verifiable.
- ◆ *Charlene Boehm.* Ms. Boehm's method of determining frequencies is unique as well as scientifically verifiable. As a musician and mathematician, it was natural for Char Boehm to perceive numerical patterns. So she applied her keen scientific mind to develop a complex mathematical formula that calculates a pathogen's MOR. In a paper entitled "A Look At the Frequencies of Rife-related Plasma Emission Devices," Boehm describes her thought processes and what led to her discovery. "What exactly might be the destructive mechanism that is affecting each organism?" she initially asked herself.

Is it a resonance related to its full size, or perhaps that of the nucleus, mitochondria [tiny fuel-burning units inside a cell], or capsid [the outer protein shell of a virus particle]? Is it a correlation with some type of biochemical resonance? Why does each organism seem to need a specific frequency?

Could the phenomenon be related to its DNA, and if so, what is the resonance relationship? These questions and more have kept folks that use or explore Rife-related technologies awake into the wee hours of the morning on many occasions, and have been the focus of endless animated discussions.³⁵

Boehm knew that the physical length of any object correlates to its wavelength: “For instance, a person’s height has its own resonant wavelength and resultant frequency.” Therefore, she wondered, “Is it possible that an organism’s entire DNA genome [genetic material] could also possess a resonant wavelength and frequency related to its total length?” After examining the published analyses of DNA structure from biologists, she worked out a formula for calculating the wavelength of a microorganism. Then she utilized a common physics equation to determine the frequency. “It is interesting to note,” she writes, “that this frequency falls at the high end of the infrared section of the electromagnetic spectrum (near visible light), and in the general area of the spectrum that Royal Rife had under consideration in his microscopic work.”³⁶

To obtain the numbers for her calculations, Boehm uses a government database that contains measurements of an entire pathogen or portions of its structure (a modern convenience not available to Royal Rife). Her final step is to convert these very high figures to workable numbers that accommodate the permeability of both human and animal body tissues, and can be transmitted by modern frequency equipment. It’s not a coincidence that Boehm’s numbers for the pathogens that Royal Rife was working on very closely correlate with the frequencies in Rife’s original lab notes! Sometimes her frequencies exactly match those of Rife and modern researchers; other times, they’re within one to five Hz. These differences seem negligible.

Boehm was awarded a patent by the US Patent Office (#7,280,874) for her DNA frequency method, formally titled “Methods for determining therapeutic resonant frequencies,” on October 9, 2007. Her work holds enormous promise for the

successful use of rife technology as newer and more dangerous microbes continue to emerge and we need to find the debilitating frequencies quickly. For a very nominal fee, she provides customized frequencies on her website, dnafrequencies.com. Serious researchers have found Boehm’s frequencies to be highly effective, and most rifers who use this service report being very pleased with the results.

Please note: since the last edition of *The Rife Handbook* was published, Ms. Boehm formally established her frequency creation service as a

business. Out of respect for her patented intellectual property, I have not included any of her data that was not in the public domain. However, her work is invaluable. The frequencies in this *Handbook* will not apply to everyone. If that’s the case for you, I highly recommend Boehm’s database, which has an excellent chance of succeeding—providing you know the exact microorganism you’re dealing with and your rife machine is accurate.

Knowing others is intelligence;
knowing yourself
is true wisdom.
Mastering others is strength;
mastering yourself
is true power.

—Lao-Tzu

Chinese philosopher and writer,
the founder of Taoism, and
attributed author of *Tao Te Ching*
(died 531 BCE)

Q. I have a diagnosis from my doctor. How do I know which frequencies to use?

A. The beginning of Chapter 5 explains how to use the Frequency Directory. However, be aware that although many people are satisfied with the results they get from the frequencies in this book, additional frequencies may be needed. If you have a diagnosis of a specific pathogen, the best site for custom frequencies is dnafrequencies.com. For a very nominal sum, you can get a customized program of frequencies that are mathematically calculated using the measurements of portions of the pathogen’s own DNA.

Q. What if I don’t have a diagnosis, and don’t know which pathogens are involved in my condition?

A. These guidelines will help you decide which frequencies to use (whether they’re from this *Handbook* or another source). During and after your session, don’t forget to monitor your responses so you can determine which frequencies offered the greatest relief.

- ◆ *Diagnosis that is pathogen-specific.* In many cases, it would be best to have the name of the particular harmful microbe that’s infecting you. Simply look up the frequency for it, as in *Babesia*, for example.

You Know More Than You Think

There's a reason the gut, or belly, is called "the second brain." Over 90% of all neurotransmitters—which we consider "brain" chemicals—reside in the gut and not the brain. This simple but powerful technique will help you (re)connect to knowledge you already possess.

Neutral. Close your eyes. How do your muscles feel? Relaxed or tight? Pay attention to your breathing. Is it fast or slow, noisy or quiet, deep or shallow, even or erratic? Feel your gut. Is it tight or relaxed, tense or easygoing? Imagine what your energy field is like. Do you sense it as dark or bright, dense and compressed or light and airy? This gives us a baseline before we move on.

Negative. Keep your eyes closed. Now think of a person or situation that made you feel really bad, uncomfortable, wrong. Don't worry, we won't stay here; this is to get a sense of how you feel in a negative circumstance. How do your muscles feel? Relaxed or tight? Pay attention to your breathing. Is it fast or slow, noisy or quiet, deep or shallow, even or erratic? Feel your gut. Is it tight or relaxed, tense or easygoing? Imagine what your energy field is like. Do you sense it as dark or bright, dense and compressed or light and airy?

Positive. Keep your eyes closed. Now think of a person or situation that made you feel really good, comfortable, right. How do your muscles feel? Relaxed or tight? Pay attention to your breathing. Is it fast or slow, noisy or quiet, deep or shallow, even or erratic? Feel your gut. Is it tight or relaxed, tense or easygoing? Imagine what your energy field feels like. Do you sense it as dark or bright, dense and compressed or light and airy?

Back to Ordinary Reality. Now shift your attention back to where you're seated. When you're ready, open your eyes. You have just reminded yourself that there are distinct differences between when you're in a neutral state, when you encounter something that's not right for you and makes you feel bad, and when you encounter something that *is* right for you and makes you feel good.

Your body is a measuring tool, a way of telling you when something is right and when it's not. You can use these kinesthetic, visual and auditory signals as clues or guidelines to help you figure out which frequencies to use. You can also use this technique to help you with any other decision in your life. These are your gut feelings. You can learn to trust them more.

—Nenah Sylver, PhD

adapted and excerpted from a presentation at the
Rife Frequency Therapy, Electromedicine,
and Holistic Health conference
October 8–9, 2016 in Phoenix, Arizona
(DVDs available at nenahsylver.com)

- ◆ *The name of a disease or illness.* Often, the name of a disease is a slight variation of the name of the pathogen. For example, Babesiosis is caused by the parasite *Babesia*. Borreliosis is caused by the spirochete bacterium *Borrelia*, and so on.
- ◆ *Diagnosis of an illness, pathogen unnamed.* If your doctor says that you have amoebic dysentery, you can rife for amoebic dysentery or the protozoa *Entamoeba histolytica*, which causes dysentery. Chapter 5 contains all this information, cross-referenced. It makes no difference which listing you choose because the frequencies are for the same problem.
- ◆ *General symptoms without a diagnosis, usually affecting specific parts or areas of the body.* Choose the body parts or systems that are manifesting the most severe or uncomfortable symptoms: respiratory tract, gastrointestinal tract, and so on. Chapter 5 contains frequency listings according to which body parts or systems are affected. As you read each entry associated with that body part or system, you will learn to detect what's ailing you.

Be aware that most diagnoses do not indicate the *cause* of the ailment. For example, multiple sclerosis can be caused or exacerbated by a particular pathogen and its wastes, chemical toxins, or heavy metals. A migraine can be caused by an allergy, toxified liver, or *Candida albicans*. You'll have more success with frequency selection if you consult Chapter 5 to learn a bit about how the body works, and how a pathogen can cause different symptoms in different areas of the body.

Some common frequencies that are often implicated in a majority of symptom pictures include 464, 660, 690, 727.5, 776, 787, 802, 880, 1550, 1552, 2008, 2127.5, and 2489. Other important frequencies are 20, 72, 95, 125, 444, 600, 625, 650, 784, 832, and 1865. If your machine has a sweep function (explained earlier in this chapter), try a sweep from 420 Hz to 482 Hz.

If you feel too ill to troubleshoot, if you find it too inconvenient or time-consuming, or if you have a condition such as cancer that requires absolute precision, consider using an electrode unit called the F-Scan. The F-Scan sends a series of signals into the body. Then, based on the body's response of resonance, the device displays on a screen those frequencies that are *hits*. Then it delivers those frequencies. The F-Scan can transmit frequencies in the high KHz (kilohertz) range, which is optimal for cancer and some parasitic infections. Due to the high range output, the current is felt very little, if at all.

The end of this chapter has a guide to giving yourself a rife session. Also see Chapter 5, the Frequency Directory, which contains an extensive alphabetized listing of pathogens, diseases and symptom pictures.

One more thing. By enhancing your knowledge and ability to think holistically, to a great extent you can be your own diagnostician and healer. Some people feel uneasy about being proactive about their own health. They think, “But my doctor is the expert. I’m just a layperson. How can I possibly know what to do?” While I respect the grueling program and years of study required of physicians, I’m also aware of the limitations of that training. Most doctors are taught to focus on pathology rather than on optimal function. They are given illness training, not wellness training. As a result, they often fail to comprehend the body as a functional organism of interdependent systems. In these pages, you can acquire practical knowledge and an understanding of relationships and concepts that many conventionally trained doctors lack. So don’t devalue what you already know, and be open to learning more. You may have more choices of treatment modalities than you’ve been led to believe.

Everything you’ll
ever need to know
is within you; the
secrets of the universe
are imprinted on the
cells of your body.

—Dan Millman
American author
(born 1946)

Q. Is muscle testing a valid way to figure out which frequencies will work for me?

- A. With a little training, muscle testing (also called Applied Kinesiology) can accurately determine which frequencies the body needs. Many people who use this procedure correctly are chiropractors and other health practitioners. However, laypersons and those who specialize in the art of dowsing can also be successful. The trick is to quiet the conscious mind—full of doubting, busy chatter—so that the neurological responses to the electromagnetic information can be detected. (For more information see, on page 575, the question “How were the frequencies in *The Rife Handbook* calculated?” and, on page 576, the Sidebar “Dowsing and Muscle Testing.”) Alternatively, you can tune into your gut; see Sidebar, “You Know More Than You Think.”

Be aware that there are some variables—including dehydration, reversed polarity, and a lack of objectivity on the part of the tester—that can make it challenging to master the technique. In the aforementioned pages, some books are suggested that will help you learn.

There’s another, related frequency checking method you can try, although it can’t be done alone by the subject and requires a tester. It’s based on an objective physiological response called the Vascular Autonomic Signal (VAS), discovered by medical doctor Paul Nogier in 1966. The method involves the circulatory (radial) pulse on the wrist, which can be found with a little practice. The tester holds the subject’s wrist while the subject is exposed to a frequency. When a frequency is emitted that the body may need, a sudden change occurs in the pulse. The change in the pulse can feel like excitation (jumping or throbbing), or weakening (slower, less obvious). This VAS test may be the most practical for those without access to either custom designed frequency programs or a powerful microscope that can show changes in the blood before and after the administration of frequencies. This method may also be preferred by people who find muscle testing difficult.

There’s always the “try this and see how you feel” method. While this method is admittedly limited, some people have reported good results by simply guessing or using their intuition.

Q. Instead of individual frequencies, why can’t we use all of them in succession—especially if we don’t know which ones are needed?

- A. People have differing opinions about this general approach. Some rifers want to ensure that all possible pathogenic mutations are covered, so they use all the frequencies they can think of. Other rifers feel that this method isn’t efficient, and not necessarily even the most effective. Believing that the body will become overwhelmed, they prefer a more targeted approach. I have heard positive reports about “all frequencies” units, so let your own unique response guide you.

Q. Why are different frequencies sometimes listed for the same condition? And why are the same frequencies often given for two different pathogens?

- A. Assuming that the numbers are correct, when the listings contradict each other by a few Hz, this may reflect differences between the human hosts. Body moisture, tissue density, terrain (biochemical composition and pH), temperature variations, and even different geographical locations can create varied strains of the same pathogen, thus causing changes

in its MOR. Also, a number might be the resonant frequency of the entire microorganism, while another number might relate to a specific cellular part. Still another frequency might be mathematically related to the fundamental MOR (see the next column).

Sometimes the numbers are for unidentified secondary infections. Or, the frequencies stimulate the host's immune response rather than debilitate pathogens. And sometimes, the numbers vary greatly because they are experimental and Rife researchers aren't yet sure which ones are the most effective. As some frequencies are more effective in disabling pathogens than others, you may want to try all of them. Or, you may want to learn dowsing or muscle testing so you can correctly choose only those numbers that will benefit you.

Q. Do higher frequencies work better than lower frequencies?

- A. Frequencies in the lower ranges are quite effective for many conditions. However, for cancer, it may be preferable with most equipment to use numbers in the higher MHz (megahertz) range. If your machine can't go that high, you can keep dividing by 2. See next column.

Q. What are “audio range” frequencies?

- A. The phrase *audio range*, commonly used by engineers, can be confusing. Theoretically, every frequency on the electromagnetic spectrum corresponds to a sound—if we could hear it. A so-called audio frequency is simply a wavelength that is in the range of human hearing if the frequency were translated into a tone.

The human ear can hear tones from about 20 Hz to 20,000 Hz (which is 20 KHz, or kilohertz). The lowest pedal notes of a pipe organ range from 16 to 32 Hz. Bells and cymbals are in a relatively high range of 16,000 Hz.

Some devices can emit frequencies over 20,000 Hz and even into the millions of Hz. This is beyond the range of human hearing, beyond the audio range.

Q. My unit goes up to only 20,000 Hz. But my condition requires many frequencies that are over 60,000 Hz. What should I do?

- A. Set your unit for a square wave. Take the original MOR of a pathogen—the high number—and divide it by 2. If that number isn't low enough for your unit, again divide it by 2. Keep dividing it by 2 until the resulting number lies within the range of your machine. For example:

- ◆ The original frequency is 140,000 Hz.
- ◆ Divide 140,000 by 2, which lowers it to 70,000.
- ◆ Divide 70,000 by 2, which lowers it to 35,000.
- ◆ Divide 35,000 by 2, which lowers it to 17,500. This is in your machine's range: 17,500 Hz.

This formula is based on *subharmonics* of the fundamental frequency. To understand this, the best analogy is notes on a piano. There is a note A that vibrates at 55 Hz. The octave above that vibrates at 110 Hz. The octave above that is 220 Hz; the octave above that is 440 Hz; the octave above that is 880 Hz, and so on. If you multiply the frequency by 2 or divide it by 2, you have the same musical note, but in a different octave.

Another way of doing this is by “stepping down” your fundamental frequency with *powers of 2*: 2, 4, 8, 16, 32, 64, 128, 256, 512, etc. Each number is double the number before it. For example: You've determined that an optimal frequency is 128,512 Hz for a certain pathogen. But your machine will only generate frequencies up to 5000 Hz. So you use one of the numbers that's a power of 2 to step down the frequency—in this case, 64. You divide 128,512 by 64 to obtain the frequency of 2008 Hz.

Some experimenters have also successfully used powers of 10—that is, 10, 100, 1000, etc.—but this doesn't work nearly as well as using powers of 2, because there is one peak and one trough on a wave (see Appendix C). Lists of already-computed calculations can be found at royalrife.com/lists.html.

Stepping down the fundamental frequency may work fine for most health problems, but people with cancer may obtain better results with a unit that can reach the MHz range. The higher numbers reflect the actual Mortal Oscillatory Rates of the cancer virus (see Chapter 2 for more information). However, two tumor frequencies in the lower range—2008.35 and 2127.5—have been found to work well.

Q. I heard that you get better results using a higher number derived from a calculator found on the Internet. Where can I obtain this calculator?

- A. This calculator is from Jeff Sutherland, PhD. He stated that after conducting over one thousand experiments, he found that his numbers “cut the time required to kill a pathogen by more than 50%,” compared to dividing by 2 to obtain lower octaves of the main frequencies. “I found a method of calculating scalar octaves that I now

use consistently. Simply divide or multiply by $\exp(3)$, $\exp(6)$, or $\exp(9)$.³⁷

Some people are understandably confused because Dr. Sutherland calls his frequencies “scalar octaves,” despite the fact that “scalar” technically refers to *longitudinal waves*, an entirely different phenomenon from EM waves. Sutherland cannot explain the theory behind his calculations, though some people use them.

Rifers who want, at no charge, a reliable division table to obtain lower octaves of the main frequencies can write Char Boehm in care of her website, dnafrequencies.com.

Q. Some frequencies are said to regenerate an organ or gland, rather than kill pathogens. How is this possible? And why didn’t Royal Rife address this?

- A. Killing or devitalizing a pathogen that doesn’t belong in the body obviously helps us function better. But what about direct effects on the cells? Could the emissions from some electromedical devices be rejuvenating or healing to the body?

Rife himself did not specifically focus on frequencies we would call “rejuvenating”; he was involved strictly with the destruction of harmful microbes (at least, that’s what the public was told). However, new evidence shows that the better rife machines *do* normalize cell function. Experimenters often find that:

- ◆ Frequencies that debilitate harmful microbes and frequencies that restore human tissue can overlap, but not always.
- ◆ Square waves may be better at killing harmful microbes, while sine or truncated triangular waves rejuvenate cells.
- ◆ Harmful microbes are adversely affected by the EM fields that are compatible with healthy tissue.

The overt pathogen-killing focus of rife technology sometimes eclipses solid data on tissue regeneration that has emerged from other sources of electromedical research. In the groundbreaking article “Electrical Properties of Cancer Cells,”³⁸ medical doctor and clinical nutritionist Steve Haltiwanger describes in detail how the body is a living electrical circuit. Cells and tissues are *conductors*: they promote electron flow. They’re *insulators*: they inhibit electron flow. They’re

also *semiconductors*: they promote electron flow in one direction. And they act as *capacitors*: they accumulate and store charge, and later release that charge. In addition to transmitting and receiving energy, each cell has its very own frequency with which it oscillates. Scientists have also discovered that in humans, the sinuses, some facial bones, and various bodily tissues contain magnetite, which responds to magnetic fields.

Not only is every cell in the body a transmitter and receiver of electromagnetic information, but *electromagnetic frequencies precede and correspond to biochemical functions*. We know, for example, that healthy cells oscillate at higher frequencies than do unhealthy cells like cancer, and the lower frequency of cancer is reflected by aberrant biochemical reactions within the cell. Likewise, the biochemical differences between normal healthy cells and cancer cells correspond to the differences in the electrical properties of each. The same holds true for magnetic fields. Magnetic fields correspond to biological activity. A change in the field means a beneficial or injurious change in the cells.

By the way, as you peruse various frequency lists, be aware that there’s a difference between frequencies (or substances) that normalize or regulate, and those that stimulate. *Normalizing* or *regulating* an organ or gland calms it if it’s overexerting, and gives it more energy if it’s lethargic. However, *stimulating* an organ or gland increases its output of activity. Whereas depleted body parts may benefit from carefully applied stimulation, organs or glands that are already overworking should not be forced into more activity. The few frequencies that appear to be stimulating to various organs or glands (as opposed to simply normalizing) may have an unwanted effect on you if you do not want that particular body part to be stimulated. That said, I have not heard reports from people who felt that their adrenal gland function (for example) was excessively boosted. As always, pay attention to how you feel and stop rifting if it’s not helping your overall wellness.

There’s one more aspect of the regeneration function of some rife machines: the presence of *scalar waves*, sometimes called *longitudinal waves*. Scalar waves are a form of energy not on the electromagnetic spectrum. They’re produced by any unit capable of emitting rapid, sudden electromagnetic spikes. These EM spikes are thought to unleash and activate the

If you want to find the
secrets of the universe,
think in terms of energy,
frequency and vibration.

—Nikola Tesla
Croatian scientist, inventor,
mechanical and electrical engineer,
and overall Renaissance man
(1856–1943)

scalar fields that are already present. The regenerative qualities of Rife's technology are separate from the pathogen-killing aspects, and may at least in part result from the balancing influence of these scalar waves.

Scalar fields affect the cells like charging a battery that has lost its power. Some rife machines may strengthen the external scalar field, thus making it easier for the person to access them. The machines may increase a person's receptivity to these scalar waves by strengthening his or her individual energy field. Or perhaps the devices actively engage the scalar waves and harmonize them. This would enable the particles comprising the scalar fields to communicate with each other and also with the body, transmitting information that allows the cells to function properly and heal. One manufacturer hypothesizes that his unit is particularly effective in providing access to the energy from this healing scalar field.

Electromedicine is still in its infancy. I believe that if we keep an open mind regarding the existence of non-EM energy, many applications for healing (and energy or power as well) will be discovered.

Q. My unit has settings for different shaped waves: square, sine, and sawtooth. What's the difference between the waveforms?

- A. The success of Rife Therapy depends on the machine used; but generally, some researchers prefer using *square waves* when dealing with *pathogens*, and *sine waves* when focusing on *cell regeneration and tissue repair*. Unlike sine waves, square waves contain harmonics and may have a better chance of targeting pathogens. So, if your machine cannot reach a high-frequency MOR, a lower-frequency square wave may work. See the earlier Insert, pages 524–526, "Signal Penetration: Wave Shapes, Harmonics, and Duty Cycles," for details.

Q. How do I know that Rife Therapy is safe? If it kills pathogens, won't it harm me?

- A. Although some of the frequencies are regarded as experimental, researchers generally agree that this technology is safe. The differences between highly complex human beings and simple microorganisms are substantial. Human cells are distinct from microorganisms in size, shape, density, chemical composition, electrical charge, and function. All these factors make it highly remote that any of the pathogen-destroying frequencies would affect us adversely. Even assuming that the resonant frequency of a pathogen

does resonate with some part of our physiology, *the amount of power needed to damage a human cell is so many times greater than the power needed to destroy the pathogen, that a properly made rife unit will not harm us or other complex organisms*. Think of the amount of pressure required to smash an ant with your finger. Now touch your arm with your finger, applying that same amount of pressure. What kills an ant hardly affects you.

Q. Most rife units that shatter or disable pathogens under a microscope or in a Petri dish are unable to achieve the same result in live human beings. Why? Is there something wrong with the machine?

- A. There's nothing wrong with the machine. As discussed in Chapter 2, Rife's best ray device destroyed microorganisms in both live animals (*in vivo*) and in Petri dishes and microscope slides (*in vitro*) because it transmitted in the very high MHz ranges and produced abundant harmonics. Due to legal restrictions, modern manufacturers have been forced to build devices that convey frequencies in a different manner. In many cases, they must also use different (though related) frequencies. This accounts for the discrepancies between what Royal Rife's units could do and what today's frequency devices can accomplish.

With this understanding, let us examine why modern devices can destroy harmful microorganisms in living bodies but not in Petri dishes and slides, and vice-versa. There are several reasons.

One, a living human or animal body functions very much like an antenna; the soft tissue and fluids are moving constantly. Possessing natural resonance, they receive and process frequencies much differently than a nutrient medium containing microorganisms, which by contrast is rather static. Two, the contents of a Petri dish and the body of a human being or animal have much different densities, water content, and electrical activity. In fact, one researcher points out, the body is composed of a mixture of chemicals similar to that of seawater, which is highly conductive. (He proposes designing *in vitro* tests that use a similar conductive medium, as this may more accurately simulate the effects of a frequency device on the body.)

A third possible reason for the difference in results *in vivo* and *in vitro* is that the velocity of the same signal is different in these two media. An analogy to this phenomenon is the way the pitch and tone of an audio signal sound different when transmitted underwater, as compared to through the air. These

differences may change the frequency required to address a pathogen. Rife sometimes put cultures inside large slabs of meat before exposing them to his ray device. Some researchers think that this may have been to simulate the frequency shift.

James Bare reports being able to explode paramecia with the same machine he uses on his live pets. However, his equipment is less than two feet from the specimens. If you're looking for a rife unit that can destroy specimens in a Petri dish, ask the seller if the machine is compatible with your research goals.

Q. If the frequencies are so effective, why do I need to use the machine more than once?

- A. The first, obvious reason for lack of results is that the frequencies you are using are not the ones you need.

The body's acceptance of the signal, however, is as important as the correct frequencies. Some inventors interpret this to mean that the more power the unit has, the fewer number of sessions you'll need. In this instance, *power* means the force with which the frequencies are transmitted by the machine into the body. The power of a machine can depend on the gases in the plasma tube, the electronics, and the strength of the current that feeds the unit. Virtually all units have adjustable controls, which provide more power. If the manufacturer says that it's safe, you can try moving closer to the machine.

But force or strength of the signal doesn't always mean *acceptance* of the signal. The body's tissues may become resistant to the frequencies. This is why it's so important to use a device that has been carefully engineered to be compatible with living tissues.

Dr. Jeff Sutherland, who has considerable experience helping others with severe conditions, points out that usually, illness-causing pathogens reside in multiple layers. For instance, viruses often live inside bacteria, and bacteria often live inside protozoa and worms. A protozoan might be devitalized, only to expel a viable bacterium—which in turn might force out a virus! Rife himself wrote that certain bacteria such as *E. coli*, and the bacilli for tuberculosis, typhoid and other diseases may release a form of virus. This is why experimenters must be creative and use different frequencies that cover viruses, bacteria and parasites. A smaller pathogen might be living inside a larger one.

Sometimes, the body's terrain supports the existence of different pathogens that don't live inside each other but nonetheless co-exist in a symbiotic relationship. If you are host to different pathogens, targeting them all in one session might produce a detoxification response that's too strong and causes considerable discomfort. Therefore, it's wise to regulate the die-off by not exposing yourself to all of the required frequencies at once. Even if you're hosting only one type of pathogen, if you have a chronic or severe condition, killing or disabling all of them at once could similarly produce too strong a detoxification response. Therefore, limit the time you spend with the equipment.

Additional sessions will also be needed if you're using a frequency for too brief a time and the frequency only stuns, rather than disables or kills, the pathogen. Experiment with how long you need to run a frequency. If the pathogen is especially resistant, use the gate feature, and sweep or converge if your unit has them.

Sometimes the tenacity of the illness requires a more aggressive approach. For instance, most people with cancer rife twice a day for 4 to 6 months, depending on the machine and the state of the person's health.

The tumor comes off in layers, much like an onion that's being peeled. After the person appears healed, there's a maintenance period. The unit is used once a day or several times a week, for at least several months.

Parasite elimination likewise requires a very aggressive strategy. Frequencies that disable an adult worm will not affect it in its earlier stages as a vastly different egg; so people or animals afflicted with worms must wait for the eggs to hatch into mature adults before rifting can have an effect. Thus, more sessions are required.

More sessions are related to more time per session. Researchers theorize that some people need longer sessions because some pathogens may be hiding deep in the host's tissues. The fields of the surrounding host tissue mask the frequencies of the individual microorganism, much as an individual violin can't easily be detected from within an entire orchestra.

Viruses may be especially difficult to kill. They lack their own RNA and DNA (which is why they appropriate the host's RNA and DNA). RNA and DNA are very sensitive to electromagnetic fields; but a virus, lacking these chemical building blocks, may find it easier to resist the effects of the frequencies.

**The most outstanding feature
of life's history is a constant
domination by bacteria.**

American Museum of Natural History
(1941–2002)

Another reason to use the machine multiple times is the naturally occurring mutations of “offspring” pathogens. (Sweeping is helpful in this situation.)

Finally, don’t forget that the body needs time to balance the terrain that initially allowed the pathogens to multiply. If the terrain isn’t altered, the pathogens will continue to proliferate: if they leave, it may only be temporary. A researcher once told me that using frequency equipment is usually an “80% solution.” What he meant was that even when the correct frequencies are used at sufficient power, the best that can be hoped for is a reduction of 80% of the pathogen population (or maybe 90% when using the sweep function). For someone with minimal toxin accumulation and a healthy immune response, killing 80% of the pathogen population may offer enough support so the body can control the remainder of the infection. However, for someone with limited immune function and excess accumulated toxic waste (which provides a fertile feeding ground for microorganisms), killing 80% of a population may not be sufficient. Even if a frequency device killed 90% of harmful microbes, some fungi and bacteria can multiply so quickly that within 24 hours the population can match its original size. Making the terrain inhospitable to pathogens is essential to prevent an infection from recurring.

We leave the womb without a single microbe. As we pass through our mother’s birth canal, we begin to attract entire colonies of bacteria. By the time a child can crawl, he has been blanketed by an enormous, unseen cloud of microorganisms—a hundred trillion or more.

They are bacteria, mostly, but also viruses and fungi (including a variety of yeasts), and they come at us from all directions: other people, food, furniture, clothing, cars, buildings, trees, pets, even the air we breathe. They congregate in our digestive systems and our mouths, fill the space between our teeth, cover our skin, and line our throats.

We are inhabited by as many as ten thousand bacterial species; those cells outnumber those which we consider our own by ten to one, and weigh, all told, about three pounds—the same as our brain. Together, they are referred to as our microbiome—and they play such a crucial role in our lives that scientists . . . have begun to reconsider what it means to be human.

American award-winning journalist, book author
and *New York Times* staff writer,
specializing in medicine, science and technology
(born 1955)

Q. Pathogens can become resistant to antibiotics. Can they develop a similar immunity to frequencies and proliferate?

A. Yes, they can. Earlier, I analogized the soldiers on the bridge who “break step” to bring the swaying bridge to a halt. Think of the swing analogy too. One person pushing the swing does so in a regularly paced, constant rhythm. This allows the swing to gain momentum. Now another person comes along who pushes the swing at a different rate. If the swing is not pushed at precisely the right moment, this new pair of hands may disrupt the momentum the swing had from person number one, and may even stop the swing completely. You don’t want to confuse the body with too many frequencies. This confusion, along with too brief a time with each frequency, may merely “tickle” or stimulate the pathogens instead of disabling them—thus giving them time to mutate. Put another way, too brief a session can provide what might be called positive stress, to which they can adapt. However, an adequately lengthy session provides copious amounts of negative stress (to the pathogen, that is).

This is why you need to give yourself enough time with the device. You can compensate for the pathogens’ adaptation mechanism by programming the machine to perform a sweep or converge. All good rife units are equipped with this feature.

Incidentally, there may be some natural small variations in the oscillatory rate of pathogens. Some researchers suspect that pathogens change their rate every twenty, fifteen or even ten years, although the changes may be slight. Even the time of day and cycle of the moon may affect their viability.

Q. How much frequency drift is allowable for the rife equipment to still be effective in destroying pathogens?

A. This question refers to the capability—either random or deliberately programmed—of a signal to drift or meander a bit under or over the number to which it was set. Say you set the machine for 660 Hz. The indicator on the machine might initially read 660 and then go up to 661. Or the indicator might go down to 659. These small shifts naturally occur due to the components, rather than being deliberately programmed into the unit. However, some machines can be set to drift plus or minus any number of Hz on either side of the main frequency.

There’s a lively debate among rifers as to how much drift on either side of the signal is acceptable before

the frequency ceases to have the desired effect. Some researchers feel that the signal should be absolutely steady for the most beneficial effect. Others maintain that a small waver in the signal is preferable, in case the pathogens have mutated to a slightly higher or lower frequency—after all, something that is alive is never static. I think that both viewpoints have merit. Sometimes the lack of precision doesn't seem to matter; other times, it does. To make absolutely sure that you have targeted the microorganism accurately, set the machine to do a sweep a couple of Hz before and after the main signal. However, as with any sweep, you'll need to program a longer session time to ensure that the machine lingers on all of the increments long enough to devitalize the pathogen and not merely irritate it.

Precision matters more with low numbers than high ones, because the percentage of how much the number might deviate is greater with a lower figure. Say you want 1.2. If your machine drifts to 1.3 or 1.4, this is a huge deviation—almost 10%—from the number you want. But if you want 802 and the machine registers 800, the deviation is only $\frac{2}{802}$ of 1%. Make sure that your machine can handle decimal points, as some numbers must be precise.

Q. There are some units that deliver frequencies in rapid succession, usually in the high range. Are these machines effective?

- A.** There are devices on the market that rapidly deliver frequencies in succession, covering a wide range (including RF). Just a few are the Multi-Wave Oscillator, the BELS machine, the Tesla Lights™ machine, and the Molecular Enhancer™. These units are oriented more to normalizing cell function, regenerating tissue, and alleviating pain than they are to killing pathogens.

This equipment may not be suitable for everyone, however. The wide range of frequencies is produced by a spark gap, or voltage that leaps across a space between two components. Whenever a spark gap is used, the signal is chaotic. Also, part of the signal is in the RF range. Earlier in this chapter I discussed the potential harmful effects of radio frequencies (RF). Some people react negatively to both RF and to chaotic signals. Several researchers are skeptical of such units precisely because of the chaos. Might the chaotic signals be inducing biologically incompatible chaos into an otherwise functional system?

Traditional Buddhist Healing Prayer

Just as the soft rains fill the streams,
pour into the rivers, and join together in the oceans,
so may the power of every moment of your goodness
flow forth to awaken and heal all beings—
those here now, those gone before,
those yet to come.

By the power of every moment of your goodness,
may your heart's wishes be soon fulfilled
as completely shining as the bright full moon,
as magically as by a wish-fulfilling gem.

By the power of every moment of your goodness,
may all dangers be averted and all disease be gone.
May no obstacle come across your way.
May you enjoy fulfillment and long life.

For all in whose heart dwells respect,
who follow the wisdom and compassion, of the Way,
may your life prosper in the four blessings
of old age, beauty, happiness and strength.

Nevertheless, one cannot discount reports from the many satisfied users of such machines who report overcoming illnesses and feeling recharged. Also, many effective electromedical devices operate on similar principles. Is it possible that people who feel worse after using these devices lack the cellular strength to resist chaos? Might they simply be overly sensitive to RF? I personally found the Molecular Enhancer™ quite helpful for pain management after a severe auto accident. The company's literature states that the machine raises the electrical potential of cells.

Results from variable-frequency devices depend on the subject's condition. If you decide to experiment with such devices, monitor your responses carefully and stop using the equipment if you don't feel better within a reasonable period of time.

Q. Is there any other equipment that's compatible with Rife Therapy that might help me?

- A.** I can't think of any electromedical equipment that wouldn't be compatible with rifting. This includes the hand-held Magnetex®. Its spinning magnets create a vortex that draws pathogens, chemical toxins and other debris out of the tissues into the bloodstream. Pathogens in the bloodstream are more accessible to being disabled by rifting, which could help people with Lyme for example. See Appendices A and C.

Practitioners and Rife Therapy

Q. My doctor says that if Rife Therapy really worked, he'd know about it. So how can I be sure that it's effective?

- A.** Given the attempts to suppress this technology, it's unlikely that your doctor would have learned about it in medical school. You are the one who has experience with this modality, not your doctor—so you need to ask yourself if your health is better, if any possible detox reactions were lessened by cleanses, and if you are continuing to get better. *Bottom line, if you are helped by the frequencies, they work.* It's significant that no serious scientific research articles have been published that can debunk this technology. We must ask why.

Rifing is still an experimental technology, in part because during Rife's time, the medical authorities confiscated equipment and destroyed valuable records of cures instead of allowing Rife and his colleagues to continue their studies and clinical treatments. It's my earnest hope that this *Rife Handbook* will encourage more researchers to come forward with documentation, and inspire other qualified researchers to seriously study this exciting and growing field of frequency healing.

Q. Instead of buying my own machine, shouldn't I see a doctor or qualified rife practitioner for sessions? I'm afraid I won't know what I'm doing and will hurt myself.

- A.** In most areas of the United States, it's illegal for licensed health practitioners to administer rife sessions. If they're caught, they can lose their license and even go to jail. It's also illegal for a layperson to provide rife sessions for a fee—especially if medical claims for the equipment are being made, and sometimes even if they aren't (see Appendix B). This is why a “qualified rife practitioner” doesn't exist.

Even if it's legal for a health care provider to administer Rife Therapy, I strongly advise you to buy your own unit anyway. Even though the initial cost is more than a single doctor visit, over a period of time it will be much less expensive for you to have your own machine than pay the practitioner every time you want to use his or her equipment. Also, it won't always be convenient (or possible) for the health care provider to give you sessions just when you need them. Finally, you own the unit and get to use it for yourself and anyone else, long after your last appointment with the health care provider has ended. People who are

chronically ill, or have a condition that requires daily use, need their own unit.

Don't be intimidated by this equipment! That's why I wrote this Rife Handbook. If you apply what you read in these pages, you'll be able to take charge of your own health.

Q. I have a serious illness and require medical supervision. How can I find a doctor to work with while I give myself rife sessions—someone who's knowledgeable about Rife Therapy?

- A.** I am glad that you are seeking outside assistance. Part of taking charge of your own health means knowing when to seek guidance from an experienced and trained professional. The guidance you require may range from medical testing and nutritional assessments to psychological and spiritual counseling.

In most states in the US, it's illegal for a licensed physical or other health practitioner to use Rife Therapy (see Appendix B for details). Therefore, you'll be using the equipment yourself and seeing a professional for medical supervision. Because Rifing can create a lot of toxic debris in the system, it's important to be monitored, especially if your elimination channels (colon, kidneys, liver and lymph) are weakened.

Your guide can be a open-minded medical doctor, a naturopath, osteopath, chiropractor, homeopath, or other health care provider. Thanks to their training, and access to tests and various medical devices, these practitioners are equipped to detect problems that the average layperson probably won't recognize. The benefits of consulting a professional can be invaluable, especially for someone with a life-threatening condition. One rife machine manufacturer tells me that without exception, all of the complete recoveries he has seen—some in people labeled “terminally ill” (such as those with cancer)—have occurred when these people have been supervised by holistic practitioners.

Your health care provider should be a facilitator, a co-creator in your process, not an authority in whom you place unwarranted blind trust. As the one who's securing medical services, you have a right to know the health care provider's training and philosophy of wellness before you give your money to him or her. Even if someone else—such as a family member or your insurance company—is paying, *it's your body and your life.* Ask to speak to the practitioner so you can discuss your concerns before you step inside the office. Ask if s/he will work with you while you use your frequency unit. At the very least, you'll need someone

who can monitor your detox pathways and help you with any problems that may occur from the die-off.

Most health professionals have been taught to condemn Rife Therapy without investigating it, so it's important that you discover beforehand your practitioner's tolerance level. (Be aware that most health professionals may lose their licenses if they even *discuss* non-approved procedures, because this can be construed as *promoting* them. Therefore, they might not want to talk to you about rifting, at least not in detail.) If the doctor doesn't know about Rife Therapy but is open to your using it, you may decide to become a client—especially if the doctor has a good reputation and track record. However, if the doctor doesn't know about Rife Therapy and doesn't *want* to know about it, you probably won't receive help integrating your home care with the protocols the practitioner gives you. You may also find that your self-care will conflict with the protocols the doctor wants you to follow. It's not worth fighting a health professional to get what you want, especially if you're very ill and have low energy. You may need to persist in your search until you find a good match.

The health care providers most likely to be open to Rife Therapy are those trained in either naturopathy or osteopathy. They're taught that their job is to facilitate the client's healing by analyzing the underlying causes of illness, rather than to merely suppress symptoms. Both naturopaths and osteopaths (and even chiropractors to an extent) receive rigorous medical training similar to that of allopaths, including anatomy, physiology and pathology. Additional training may include organic chemistry and a hospital internship in surgery or internal medicine. Holistic programs typically include nutrition, herbology, hydrotherapy, counseling, meditation, Traditional Chinese Medicine, and bodywork such as massage or trigger point release. Some schools offer aromatherapy and energetic therapies as well. If you have a serious illness such as cancer, you might want to consult an allopathically-trained physician who has studied holistic protocols after graduating from conventional medical school.

Whatever type of assistance you choose, your medical guide will want you to be informed and will welcome your questions. Don't be afraid to "step on the doctor's toes." If your doctor appears threatened

or is dismissive when you start asking questions, s/he is obviously more interested in defending his or her position than in helping you heal. This isn't someone I would see; would you?

One more thing. Legally, rife machine vendors are not allowed to provide medical advice, even if they are licensed health professionals.

Q. I want to try Rife Therapy before buying a unit, to see if the technology works. How can I find a health professional who has a rife machine?

- A.** In the majority of states in the US, it's illegal for a medical doctor or other licensed health care provider to use Rife Therapy for clients. Even if the health practitioner doesn't charge money for sessions, he or she can have his or her license revoked because

it's not part of the standard of care as described by the licensing board that granted the provider a license. In any health-related discipline, a licensing board tells practitioners what they can and can't use as a therapy, regardless of what the client actually needs. (If a layperson offers Rife Therapy for a fee to treat a medical condition, she or he can be fined or even thrown in jail for practicing medicine without a license. See Appendix B.)

Nevertheless, some locations do allow frequency therapy, so investigate what the laws are where you live. For example, one US state that's exceptionally accommodating to Rife Therapy is Arizona. The licensing board for homeopathy understands frequency and electromedical therapies—after all, homeopathy is an energy-based modality. Therefore, a number of open-minded medical doctors take the required courses to become homeopathic physicians, receive their homeopathic medical doctor degree (an MDH), and expand their practices to include a wide variety of "energy medicine" modalities. The doctor will be listed as "Name of Practitioner, MD, HMD." In the vicinity of Phoenix, Arizona alone, there are several clinics that specialize in treating people with cancer and which use Rife Therapy as part of their protocols. Some individual doctors also use Rife Therapy.

People from the US and Canada with serious conditions such as cancer or HIV are fortunate that they can choose from numerous clinics in Arizona. Or, they can go to Mexico, where Rife Therapy is

**Medicine is not only a science;
it is also an art.
It does not consist of
compounding pills and plasters;
it deals with the very processes
of life, which must be understood
before they may be guided.**

—Paracelsus,
born Theophrastus von Hohenheim
Swiss physician,
known as the "Father of Toxicology,"
and an alchemist and astrologer
(1493–1541)

permitted. If they can travel farther, there are clinics and physicians in Europe. In many countries outside North America, it is legal for rife technology to be used for medical purposes.

If you make an appointment with a clinic or doctor permitted to use Rife Therapy—a good idea anyway if you have a serious condition—you’ll soon know if this modality is for you. Be aware, however, that most of the doctor and clinic situations I’ve mentioned are invested in treating people. There’s no guarantee that they’ll allow you to “try out” a piece of equipment without making an appointment for actual treatment, unless they also sell rife machines and know that you’re seriously considering purchasing a unit.

Alternatively, you can ask a vendor if there is someone living near you (a layperson, not a licensed health professional) who might be willing to let you try their device, though due to privacy issues this may not be an option. You can also join a rife chat group on the Internet (see Appendix A for a list of groups). Many experimenters network in this manner, and some are quite willing to let others try their equipment.

If you are seriously ill, I encourage you to buy a unit for yourself. Conditions like cancer require the use of a machine twice a day for a minimum of 4 to 6 months, and for several months afterward should you decide to continue with a “maintenance” program. If you use the unit sporadically and skip days, or if you don’t linger for a long enough time on the proper frequency, you may end up “tickling” instead of destabilizing the pathogen, thus causing it to grow instead of die. Some manufacturers have a limited-time return policy on their units, minus a standard restocking fee. As there is rarely a return policy on allopathic medical equipment, this service offered by rife technology vendors is quite generous. Consider taking advantage of this option. Should you decide to return the unit, you can regard the restocking fee as a rental.

Q. I am a health practitioner and want to use a rife machine in my office. What do I need to know?

A. Your first concern is the equipment you use. Aside from the features and track record of the machine, there are two approaches you need to consider:

- ◆ *Some practitioners choose to use an FDA-accepted device.* The FDA most commonly allows a device to be used for two reasons: *research* and *pain management*. An FDA consent for research (secured by the manufacturer) covers a professional’s use of a device for investigative purposes. Research

can include treatment, as long as the practitioner keeps careful records. (Outright FDA acceptance, *not* “approval,” of a device for pain management follows the standards set by the familiar TENS unit. Even if the instrument may in fact do much more than help ease pain, “pain management” must be its official designation if the manufacturer wants to acquire and maintain FDA acceptance and if the practitioner wants to obey the law. See the discussion of FDA acceptance of a device as a TENS unit, pages 560–561.) Note that most frequency device manufacturers don’t have the desire or funds to make their equipment FDA-compliant.

- ◆ *Some practitioners prefer to benefit from an FDA exemption category that allows a practitioner to utilize laboratory equipment and modify it for their practice, as long as the use is responsible and is not being offered for medical purposes.* This little-known clause on the FDA website states: “The following classes of persons are exempt from registration . . . Licensed practitioners, including physicians, dentists, and optometrists, who manufacture or otherwise alter devices solely for use in their practice. . . . [as well as those] who dispense devices to the ultimate consumer or whose major responsibility is to render a service necessary to provide the consumer (i.e., patient, physician, layman, etc.) with a device or the benefits to be derived from the use of a device . . . whose primary responsibility to the ultimate consumer is to dispense or provide a service through the use of a previously manufactured device.”³⁹

In other words, you are legally permitted to use a frequency generator in your practice. Even if that frequency generator is attached to hand-held electrodes or a radiant plasma tube—transforming it into what you or your client might call a “rife machine”—it’s still a frequency generator, standard equipment in laboratories. You are allowed to modify it for use in your practice. We are faced, again, with the restriction that *you must not use a rife machine for medical purposes. Don’t provide frequency sessions as a medical service and don’t make any medical claims.* Keep telling yourself (and your client), “Not for medical purposes. Not for medical purposes.” One professional I know stated that the energy from the radiant plasma would provide energy to the cells. Another told her client that the plasma would help balance the client’s chakras. These might not seem like medical claims, but you

should know that “providing energy to the cells” and even “chakra balancing” *might* be construed by some medical authorities as medical claims. It depends on where you live and the leniency of your licensing board (see Appendix B for details).

One more thing. Keep in mind that if you, the practitioner, are involved with equipment that has become entrenched in the legal system—either from having made careless marketing claims or through a deliberate decision to classify the device as a TENS unit—you are likely to be entrenched in the legal system, too (at least where rife machines are concerned). Make sure that the manufacturer of your machine has marketed it correctly, and has avoided making claims that are medical or that could be construed as medical. Making medical claims potentially puts the equipment under FDA jurisdiction *forever*. It may be wise to select a machine that isn’t involved with any FDA ruling.

Now, some input about the sessions that you’ll be administering:

- ◆ *Make sure that the client’s detoxification pathways are reasonably clear before the client begins rifting.* Rifting can release plenty of microbial die-off, so the body must be able to efficiently eliminate wastes. If the colon, kidneys, liver or lymph are congested, be ready to help open these channels.
- ◆ *Carefully monitor your clients.* This is especially true for people with difficult conditions such as Lyme disease and its related co-infections. Sometimes, three frequencies at 15 seconds per frequency is all a sensitive individual can handle. You’ll need to emphasize to the client that “less is more,” and that it’s in their best interest to spend less time with the equipment until they feel better. Someone with cancer will have to be carefully monitored as well, especially if they’re taking pharmaceuticals, or vitamin, mineral or herbal supplements. Rifting causes the cellular membranes to become more permeable, so less medication and supplementation is needed.
- ◆ *If you treat clients in your office or clinic, make sure you adjust your schedule to meet their needs and not vice-versa.* Everyone’s die-off schedule (if there is die-off) is different. You may schedule rife sessions with your clients, but if they feel too ill on the appointment days to do the sessions, you’ll need to be flexible and reschedule without penalizing them financially for a missed appointment.
- ◆ *Charge less money.* Lyme clients in particular will need less time with the equipment, and therefore less of *your* time will be required. It’s unfair, and perhaps unethical, to charge them the same rates as you would charge clients who take more time. Also, please consider the physical, mental and financial hardships on clients, especially those who have been very ill for a long time with ailments that are difficult to diagnose and/or treat.
- ◆ *Do not treat someone for (the pain of) cancer unless you can do this every day for a minimum of three months!* The most popular cancer protocols involve rifting twice a day with no breaks. Do you have the time, energy and staff to administer to the client for a long-term commitment of 3 to 6 months or longer? One practitioner had a client with cancer (now recovered) who lived almost next door to her clinic. The client was trustworthy, so she was given the office keys. Twice a day she unlocked the door to give herself sessions, even on weekends and holidays when the clinic wasn’t normally open. I mention this unusual situation as an example of the commitment required to help people with cancer (as well as the remarkable character of both women who made this arrangement). The majority of cancer sufferers who take breaks from rifting find that the frequencies no longer work, and their tumors start to grow back because the pathogens have mutated. If you can determine what frequencies the client needs and you can make adjustments for pathogen mutations, breaks between sessions will not matter as much. But why risk it? Anyway, it’s more empowering—not to mention successful from a healing standpoint—if clients have their own equipment.
- ◆ *Be willing to tell your clients that it’s in their best interest to buy their own machine* (which is usually the case). Your ultimate goal must be the healing of the client, not more office visits and fees for you. If your client lives far away or travel is difficult; if your schedule doesn’t permit you to administer the sessions when they’re needed; or if (for whatever reason) you’re unable to monitor the client properly: assuming that Rife Therapy is important to the person’s recovery, the ethical and right thing to do is encourage the client to purchase a unit for home use. This will help with healing, promote good will, and may even bring you more referrals from grateful clients who call you “the doctor who cares more about helping others than making money.”

General Health

Q. Rifing relieved pain I had for decades. If the frequencies are supposed to kill pathogens, why would they work for pain?

A. We know that the frequencies help normalize the cell membrane. This allows the exchange of numerous biochemicals that help restore tissue function. Michael Tigchelaar reports that for 26 years, a friend of his suffered hip pain due to an old football injury that was completely relieved in one 30-minute session with an electrode unit. “It is possible,” he writes, “that the electrical impulses generated by this set mimic the electrical discharges of the central nervous system and instruct the brain and body to generate specific neuropeptides, the key chemicals used by the body to heal. Proper communication between the brain and the area of pain may then invoke a rapid healing process that previously may have not been possible.”⁴⁰

The effects of various types of beneficial radiation are discussed in more detail elsewhere in this chapter, in Chapter 2, and in Appendix C, “Healing with Electromedicine and Sound Therapies.”

Q. I’ve been taking powerful drugs for my condition. Can I still give myself rife sessions?

A. The energy from many electromedical devices, including rife machines, causes *electroporation*, or permeability of the cell membranes. This means that substances can enter more easily—regardless of whether those substances are nutrients, herbs, vitamins, minerals, or medications. Doctors have generally found that when their clients are rifing, the usual amounts of pharmaceuticals or supplements must be adjusted. Make sure you tell your doctor that your cellular uptake is more efficient, and that as a result, your dosages need to be carefully monitored.

Q. Are there any conditions that rifing can’t help?

A. There are several conditions that the frequencies may not be able to correct: damage caused by nutritional deficiencies; damage due to drugs or toxic chemicals; severe trauma due to surgery or mechanical injury; and damage due to the effects of electromagnetic radiation, as long as that radiation continues to exist.

That said, it can’t hurt to experiment. At best, some of the frequencies may help regenerate some tissue, or at least alleviate pain. At worst, the frequencies won’t have any effect.

Updates on Rife Technology, Research, and Legal Issues

Q. How effective is the therapy if the machine I’m using wasn’t built by Royal Rife himself? Is it possible to obtain an original Rife Ray?

A. While it’s true that modern units do not perform quite as well as Rife’s best Beam Rays unit did, this technology is still remarkable in its own right. Frequency devices that utilize principles similar to what Rife developed have helped hundreds of thousands of people worldwide, and continue to help.

Q. Are any of Rife’s microscopes still in existence? And do they work?

A. Rife’s original microscopes that are still in existence are either not working, or are being kept away from public access by their owners. Fortunately, one microscope that even exceeds the power and accuracy of Rife’s microscopes—while rendering tiny viruses visible in their live state—is now available for sale. In the early 2000s, the German company Grayfield Optical launched the Ergonom microscope, invented by scientist Kurt Olbrich. The Ergonom has a depth of field unsurpassed by any other microscope, including those invented by Royal Rife. In addition to its top-of-the-line Ergonom, it now offers less expensive models that allow most pathogens to be viewed unstained, and whose resolution, color contrast, and depth of field are still significantly better than those of normal optical microscopes. This holds great promise for Rife researchers who want to obtain data quickly and easily. See Appendix A for more information.

Q. If Rife Therapy is successful, why haven’t I heard about it?

A. There are many reasons why the American public hasn’t heard of Rife Therapy. It’s illegal for any type of frequency device to be marketed in the US to treat illness (although a few machines are cleared or approved by the FDA for pain management). Medical journals do not accept research on Rife Therapy for publication—although ironically, for decades thousands of studies that don’t acknowledge Rife and his inventions have been published on the successful use of frequencies to treat illness (see Appendix D). A US researcher made some preliminary data available on using a Bare-Rife machine to kill leukemia cells *in vitro* (see Appendix E); but whether this therapy will

be embraced by mainstream medicine remains to be seen.

In general, though, US doctors caught using rife technology in their practices may have their medical licenses revoked. This is why the majority of medical studies on frequency therapy are conducted outside the US, and the technology is approved for use in countries outside the US.

Many people believe that because they haven't been exposed to this technology, it's either fraudulent or a fairy tale. But nothing could be further from the truth. Let's explore the mechanisms of repression in greater detail.

- ◆ *The Lack of FDA Acceptance, and Pressure from the Pharmaceutical Industry.* As discussed in detail in Chapter 1, in the United States the pharmaceutical industry has a cozy relationship with the FDA and the AMA. Depending on many variables, it can cost from \$800 million to \$1.7 billion or even higher *per drug or medical device* to prove that a drug or device is effective. Pharmaceutical companies quickly and easily recoup their investment because these "testing" fees are built into the cost of the drug. Also, a drug doesn't eliminate the root cause of an illness, but instead merely suppresses symptoms. Therefore, its use creates repeat customers. A consumer might spend thousands on the same drug over the course of many years or even a lifetime.

In comparison, rife technology can eliminate all or most drugs, the equipment is bought only once (or is replaced or upgraded infrequently), and can be used not only by the purchaser, but by that person's family and friends. Therefore, the profit margin for frequency machines is relatively slim. The few electromedical device companies that have been able to invest considerable sums into testing for the FDA or Health Canada (the Canadian equivalent of the FDA), have received approval not for specific medical conditions, but for pain management.

The FDA clearly favors treatments that support allopathic doctors. To obtain drugs, one must visit a doctor for a prescription. In contrast, rife sessions can be self-administered, often without doctor consultations. Rifers tend to consult health care

providers who are holistic. Holistic practitioners are often harassed by the medical authorities, sometimes arrested, and some have even had their licenses seized for promoting non-invasive methods of healing that don't involve drugs.

- ◆ *Media Blackout in the Scientific Community and the Mainstream News.* Another reason that Rife Therapy is still relatively unknown is the resistance to its being publicized, in both medical journals and the mainstream news. In the Rife community, respected MDs and PhDs have had their credible research submissions returned to them by the editors of medical journals. And if medical journals don't publish clinical trials on Rife Therapy, newspapers and magazines generally don't report it. So the vicious cycle continues. People who depend on government approval for safety and effectiveness of a treatment are wary about trying a modality that is neither well publicized nor legally approved for medical purposes.

In the US, the general public tends to believe that if you haven't read about something in medical journals or newspapers, or heard about it on the 6 o'clock news, then it's not worth knowing about. *But publicity is not the equivalent of quality.* Just because an article is accepted for publication in a medical

journal doesn't mean that it's scientifically sound or even worthwhile. Conversely, just because an article isn't printed doesn't mean that its content is trivial or invalid. It might be about the healing modality of the century—but the public will never have the opportunity to find out what it's missing.

- ◆ *Peer Pressure and Legal Intimidation of Doctors and Scientists.* Some scientists and clinicians in the US are unwilling to risk publicizing their research because of the notoriety surrounding frequency therapies in general and rife technology in particular. Not only are doctors (understandably) unwilling to subject themselves to unfounded fear and prejudice, but using equipment in a medical context that has not been approved by the FDA for medical purposes allows a medical board to legally revoke a practitioner's license. Many of Rife's colleagues received threats of losing their licensure. This mentality unfortunately has not changed very much in 70 years.

Coming to terms with the fear of death is conducive to healing, positive personality transformation, and consciousness evolution.

—Stanislav Grof, MD, PhD
Czech psychiatrist,
co-founder of transpersonal psychology
and consciousness researcher
(born 1931)

Although some manufacturers do conduct their own clinical studies, legal prohibitions against making claims of curing disease force their studies to remain private. Thus, most users—at least in North America—must rely on anecdotal reports.

The average consumer cannot expect to hear about rifeing from his or her doctor, either. Health professionals will not treat clients with Rife Therapy for fear of their licenses being revoked.

Some conscientious clinicians and rife therapists are conducting private clinical trials. On request, they will present medical records such as oncology reports, “before” and “after” X-rays, and other written statements on hospital or doctors’ stationery that indicate complete healing of the disease (this often includes remission from cancer). One Rife researcher I know is holding structured sessions with volunteers, and is careful to conduct the following “before,” “during” and “after” tests: urine and saliva pH analysis, a 24-hour urine sampling to monitor minerals and trace elements in the body, the quantity of pathogens in saliva, and live blood analysis on an ongoing basis. However, medical journals will not publish these reports. Most medical journals contain pharmaceutical ads. Those journals that do not, are financially supported by the drug companies.

Many countries outside the United States are not only conducting electromedical research, but they are using rife and other equipment to treat serious diseases. Nevertheless, the majority of people in the US believe that this country sets the “gold standard” for knowledge. This belief is narrow and limiting—not to mention insulting to other cultures! Ultimately, those who choose the path of fewer options will pay a high price. They will sacrifice not only their health, but also their autonomy and freedom.

Q. Where can I find documentation of successful clinical trials showing that Rife Therapy has cured illness? And where is this technology being used today?

A. Although the climate in the US and Canada is bleak, outside North America the situation is very different. Serious scientific research has been conducted in Australia, Austria, Belgium, China, Finland, Hungary, Ireland, France, Greece, Italy, Luxembourg, Portugal, South Africa, Spain, Romania, Switzerland, South Korea, and the Ukraine, among other places.

In some of these countries, medical clinics and hospitals routinely use frequency devices (many of which are pad units). “In Europe, where I am based,” writes Peter Walker, “rife is used in mainstream medicine.”⁴¹ Mr. Walker, a Britain-born researcher who speaks fluent German and lives in Germany, regularly posts research on electromedicine on his website. Here is a small sample of some studies and clinical trials that resulted in units being approved for medical use outside the United States:

- ◆ The Hungarian/German device company, Oncotherm (oncotherm.org/eng), manufactures fully certified electromedical devices for the European market. Their EHY-2000 unit combines rife-style frequency treatments with heat therapy (called hyperthermia in medical circles) for the treatment of cancer, as both cancer cells and pathogens cannot survive at high temperatures. The equipment, used in European hospitals, has successfully treated over 100,000 people. One of many studies proving the efficacy of the machine was conducted by Gabor Andocs, DVM, in Budapest, Hungary. In the controlled study using rats, hyperthermia was found to be 17% better than no treatment whereas Oncothermia—as the combination of hyperthermia and rife modulation is called—was found to be 56% more effective than no treatment, and three times more effective than hyperthermia alone. The electrical field of the combined heat and frequencies is directly absorbed into the extracellular liquid of the tissues, thus destroying the membranes of the cancer cells. Treatments have proven successful at eliminating tumors in the bladder, brain, breast, cervix, colon, esophagus, kidney, lungs, ovaries, pancreas, stomach and throat, among other areas.
- ◆ The PET machine, made by Electromed in Australia, is a rife unit approved for use in Australia. Although the machine is approved for treating arthritis and back pain, one can use this device to treat a wide range of illnesses. The following medical study on the efficacy of rife technology was performed in Australia:

The effectiveness of [Rife] Frequency Therapy in relieving arthritic symptoms in 49 randomly selected volunteers suffering from chronic rheumatoid and osteoarthritis was investigated in a 3-month placebo study, conducted at the Tuggerah Lakes Community Centre on the

Central Coast of New South Wales (10th May 1993 to 14th August 1993).

The net mean reduction in pain of the treated volunteers, when compared with the untreated group, was 21% which is in good agreement with the net mean 26% reduction in oxidative processes in the treated versus untreated groups.

The significant improvement in treated volunteers' signs and symptoms was confirmed in written testimonies requested from each participant at the conclusion of the study. . . . The study results suggest that . . . Audio Frequency [Rife] Therapy is highly effective in the treatment of osteo and rheumatoid arthritis. After 36 three-hour treatment sessions of Audio Frequency Therapy, the net mean overall improvement in the arthritic condition of treated volunteers (irrespective of type of arthritis suffered) was approximately 25% (based an analysis of pain levels and HLB blood tests).⁴²

Several pad devices, including the Swiss F-Scan, have been given official European medical CE certification (the equivalent of FDA approval in the US) for use by medical doctors.

The Internet has been a major influence in bringing cutting edge material to the public. Perhaps this is one reason that medical organizations—along with some government officials in the US, China, and other countries—are trying to restrict access to this material. In some cases, they have succeeded.

Q. Where can I find the devices you mention in this book?

- A. See Appendix A for selected frequency equipment manufacturers. You can also find electromedicine equipment on the Internet. Keep in mind that rife machine vendors are not allowed to make medical claims for their units, so the data you are given may be less informative and substantial than you'd like. Sellers of equipment are not even permitted to provide anecdotal reports from users about how the machines have helped them. At best, you'll find a good summary about the specs of the unit itself: how much power it emits, its size, features, the range of frequencies it delivers, its programmability, etc. While this is useful and necessary information, you won't get its track record in treating illness.

You can, however, find forums and chat groups on the Internet devoted to rifting and other electromedical equipment. Many users are eager to share their stories of healing (or not) with others. If you have Internet access, spend time online with other experimenters. You will learn a great deal that sellers are legally forbidden to put into writing.

All kinds of electromedical equipment, including rife devices, are on the Internet. You can search for them with phrases such as "rife device," "rife machine," "rife frequencies," "frequency device," "frequency therapy," "resonant light," "pulsed plasma," "pulsed energy," "electromedicine," etc. These keywords may lead you to articles on diseases that are treated with pulsed magnetic or electrical fields, but which do not specifically mention the word "rife." Also, see Appendix D for some studies using frequency therapies and Appendix E for information on a medically supervised *in vitro* study using a Bare-Rife machine.

Q. Why don't you discuss [a particular] machine?

- A. There's more equipment on the market than what I could possibly cover. Plus, new units are constantly being manufactured. This is why I discussed *types* of machines at the beginning of this chapter. As for specific equipment, like everyone else I have my personal preferences. Here are several reasons for what I included and what I omitted.

The most obvious reason for some exclusions is lack of quality, in either construction or features. A couple of brands did not deliver precise frequencies, based on reports from impartial engineer colleagues. In some instances, the signal was almost 5 Hz off from what it was supposed to be.

My second reason relates to customer service. Some units may have been adequate, but I wouldn't have known because of the unsatisfactory support. Sometimes the staff was very rude. In a couple of cases, the support was non-existent.

Three, I didn't want to include equipment that in my opinion was promoted via misleading or deceptive advertising. That said, unfortunately I was obliged to make allowances for companies whose marketing was "only" *somewhat* suspect—companies whose equipment is popular among rifers. Sadly, very few frequency device manufacturers are scientists; and even well-meaning vendors make technical mistakes when advertising their wares or comparing their equipment to that of other manufacturers. At times, I had to make difficult decisions about machines whose promotional literature straddled the line between accurate and

questionable. My priority has always been to be as factual and precise as possible, but I also recognize that perhaps it's expecting too much for manufacturers to be equally meticulous. (My emphasis on details is why *The Rife Handbook* contains more engineering and science details than perhaps some readers would like. However, those who do want the details will be more informed when talking to vendors.)

My final criteria for inclusion was based on ease of operation. When this book was almost completed, a new unit was marketed that became popular in a small but growing circle of rifiers. However, its software is very complex and extremely difficult to operate for the average person. In the twenty years that I have written about Rife Therapy, I have communicated with thousands of sick people and have learned what their capabilities and needs are. Despite the low price of this new unit and reported successes, very ill people—and even their friends and family members who aren't ill—don't have the energy, time, or brain power to learn how to operate complicated equipment. They feel intimidated by the technology's complexity, made even more difficult because the company has no phone support, only online support. To me, this is a significant drawback, especially with such a user-unfriendly unit.

Sometimes, my decision not to investigate further was easy. In one case, a manufacturer made astonishing claims about what the equipment could do. The seller even implied that it would no longer be necessary to consult a physician because the machine could “cure” any condition. This advice is not only illegal, it's dangerous. I would never tell anyone not to see a qualified health practitioner. Admittedly, this is an extreme example, and very atypical of frequency unit companies—but it can (and did) happen.

I wasn't completely satisfied with every machine I reviewed. (Besides, there's always room for improvement, even with good equipment.) However, now that you have completed this chapter you have an idea what to ask manufacturers and sellers so that, as an informed consumer, you can make the best choices for yourself. My hope is that as this technology becomes more publicized—and thus more in demand and easier to produce—better and less expensive equipment will be built, leading to more competition in the marketplace.

Q. Why don't you, the author, manufacture or sell frequency devices?

- A.** In the United States, it's against the law to sell a device, supplement, or other item that claims to treat

a specific medical condition if the product has not been accepted by the FDA for medical use. The labels and literature for these items are very tightly regulated as well. The manufacturer is instructed in detail about what information is allowed to accompany the device or supplement. This *Rife Handbook* explicitly describes medical uses for a device that isn't medically approved by the FDA. If I manufactured or sold frequency devices, this *Handbook* could easily be construed as medical literature that makes illegal claims about frequency equipment. Because of that, I could be arrested, fined, and even sent to jail.

One way in which the seller or manufacturer can avoid making what might be construed as a medical claim—but which gives the consumer access to information—is to have a third party write the literature. This strategy is often used by manufacturers of nutritional supplements. Authors not affiliated with the manufacturer write about the product, thereby allowing the consumer to learn about the product without making the manufacturer liable for breaking the law. In today's restrictive atmosphere, third-party literature is the best way to provide much-needed information to the public.

Finally, there's a personal reason that I don't sell Rife Therapy equipment. Selling is one of my least favorite activities. In fact, I detest it. My passions are writing and educating. Also, if I am not financially invested in a unit, I can be objective in my research.

Q. How can I learn more about Rife Therapy?

- A.** See Appendix A for sources of frequency machines, books, DVDs, Internet chat groups, and websites. See Appendix D for published studies describing the use of frequencies to treat infections and degenerative diseases. See Appendix E for an *in vitro* study on how a Bare-Rife machine can destroy leukemia cells. My website, nenahsilver.com (or rifehandbook.com), will periodically contain new developments. Also do Internet searches on a regular basis.

Now that you understand how Rife Therapy works, please review the following Insert, “A Short Course on How to Give Yourself a Rife Session.” This will help you experiment responsibly. Then, before you use the frequencies listed in Chapter 5 (the Frequency Directory), please read, at the beginning of the chapter, how the symptom pictures are organized so you can obtain maximum benefit from using the Directory.

A Short Course on How to Give Yourself a Rife Session

Part I. The Basics

1. **Study the contraindications!** This therapy may need to be modified or avoided entirely—or done with only certain types of equipment—if you have a heart condition or organ transplant, are wearing a pacemaker or other electronic implant, are pregnant, are nursing, have blood clots, are taking strong medications such as chemo, are taking herbs, are wearing metal implants or stents, or are especially sensitive to radio frequency (RF) or other electromagnetic radiation. Please review all the details at the beginning of Chapter 4 to make sure you are qualified for this therapy and are using the equipment that's right for you.
 2. **Make sure your immune response and organs of elimination and detoxification are functioning.** Most people experience die-off symptoms as the pathogens are disabled or killed. Organs of waste processing and disposal include the colon, kidneys, liver, lungs, and lymph. If these become overloaded, waste materials may exit through the skin. If you have questions about your ability to detoxify, please consult a qualified health practitioner.
 3. **Read the operator's manual and run the unit through all of its steps before your session.** Make sure that the unit is plugged into the wall and turned on. A surge protector will protect your valuable equipment from power spikes and blowouts, which can occur during electrical storms or periods of erratic electricity output. Consult your vendor about the assembly or operation of the unit.
 4. **Write down your complete health history, listing all symptoms.** This always consists of acute (recent-onset) and chronic (longstanding) conditions. However, this also includes conditions you've had for so long, you've resigned yourself to them as inevitable, unimportant, or even normal. Record these too, because continual symptoms can provide clues about which frequencies are most needed. Some pathogens can linger in the body for years, and ailments not treated immediately can escalate into other conditions. Visualize—and expect!—the best possible results. This will not only help you devise an effective protocol, it will also stimulate your immune cells.
 5. **Obtain a medical diagnosis and lab results if possible.** That said, sometimes a doctor does not order all the necessary tests, or misreads the results of those tests that are conducted. Also, your doctor does not live in your body. To complement a doctor's diagnosis, do your own research, and use common sense and intuition.
 6. **Determine which diagnosis, or which symptoms, are the most severe or dangerous. These require priority attention.**
 7. **Look up the frequencies for your condition and/or relevant pathogens, and write them down. To select the best and most relevant frequencies:**
 - ◆ *If you have a diagnosis or already know what's ailing you,* go to the appropriate listing in Chapter 5. In addition to the supplemental material in Chapter 5, you may further consult a medical textbook, Internet medical databases, etc. Diseases are named according to either the pathogen involved, the body part that's affected, the symptoms, or occasionally the name of the person who "discovered" the disease. Sometimes the same disease is given different names in different countries.
 - ◆ *If you don't have a diagnosis,* make a list of every disease to which your condition is similar. Or, write down every body part that is affected by the condition, and in what way. By experimenting with different frequency sets and observing how you feel during and after each session, you'll know which frequencies are targeting your problem.
- Important:** Don't dismiss using a particular frequency just because you have only a few symptoms! Also, some frequencies work for a wide range of ailments. Pathogens can be involved in ulcers, Multiple Sclerosis, kidney stones, and even fibromyalgia. Be aware that rifting for one condition may help other conditions you might not have thought were related, because the same microorganisms are implicated in many disease pictures. Finally, consider other options. For example, someone medically diagnosed with a brain tumor got no results using brain tumor frequencies. But when she tried frequencies for meningitis and encephalitis (both also disorders of the brain), she reversed her symptoms.

8. **Program the frequencies into the unit.** If your machine is created in such a way—either with lots of power, shape of the wave, or other configuration—that ensures the signal will be very easily accepted by the body, use each frequency for 1 to 3 minutes. This is a general guideline, however; it varies according to the individual and the ailment. For example, If your machine isn't very powerful, if you're using electrodes, and / or if you need a particular frequency for a long period of time—as when dealing with cancer or severe or chronic pain—a frequency may be run from 10 minutes to 2 hours. People with Lyme may need to begin with just 30 seconds per frequency, or even only 10 seconds per frequency each day. On the other extreme, people with cancer generally require sessions from 1½ to 2½ hours daily. Also with cancer, running a single frequency for one to two hours is common.

9. **Use the gate and sweep functions if your machine has them.** To prevent pathogens and the body from becoming resistant to a steady signal, gate and sweep to bypass the resistance.

- ◆ *Gating* (sometimes called “pulsing”) puts a sharp point or spike onto a square wave, which drives the wave more suddenly and forcefully into the body without harming the human or animal host. This feature enhances the penetration power of a frequency, and compensates for the possible resistance of the pathogens and the body to the signal.
- ◆ *Sweeping* introduces one or more extra frequencies on either side or both sides of the main signal or “target” frequency, to compensate for any variations in the Mortal Oscillatory Rate and thus ensure that you are devitalizing all of the pathogens. With a sweep, any stray microorganism oscillating outside of the usual range will be caught.
- ◆ *Converging* is a type of fancy sweep. With 2004 as the main or target frequency, here is an example of a converge: 2002, 2006, 2003, 2005, 2004. The frequencies around the target frequency not only are covered, they are also administered in an asymmetrical way to prevent the pathogens from easily adapting to what would otherwise be the same-pattern signal. Some experienced rifers feel that doing a convergent group of frequencies may be more effective than administering straight frequencies or even sweeping.

10. **In preparation for, during, and just after your rifting session:**

- ◆ Before your session, eat lightly rather than a large meal, as the microbial die-off might make you feel nauseated.
- ◆ Wear loose-fitting clothes so you can relax.
- ◆ Remove all jewelry and metal if you're using a contact device.
- ◆ Keep the room at a comfortable temperature, with a blanket nearby.
- ◆ Dim the lights.
- ◆ Place your frequency device at the appropriate distance from you if it uses a freestanding radiant plasma tube instead of contact electrodes. Consult the manufacturer if you're not sure where to put the machine.
- ◆ Sit or (preferably) lie down.
- ◆ Drink water containing either chlorophyll, electrolyte minerals, fresh lemon juice, or Vitamin C powder. This should be before, during, and immediately after the session.
- ◆ Don't engage in stressful activity, as your body needs this time to heal. If you watch TV or a movie, choose something optimistic and uplifting, not pessimistic and depressing. Depictions of violence and unethical behavior weaken the immune response, whereas portrayals of caring relationships and positive situations (such as characters taking charge of their own lives) strengthen the immune response.
- ◆ Try not to use the machine after about 4:00 p.m. Evening is a time to prepare for sleep, and the energy from rifting may keep you awake. Also, drinking is required during and after rifting. If you drink just before going to bed, you'll have to interrupt your sleep to get up to pee. And if you rife without drinking, you may have a toxic headache or other unpleasant reactions the next day.

11. **For most conditions:** A general rule for *most conditions* (but *not* for cancer or Lyme; see below) is: If you feel better the next day, do another session. If you feel a bit worse, do another session. If you feel a lot worse and dysfunctional, there may be heavy microbial die-off; so follow detoxification protocols, and wait until you feel better enough again to do another session. Repeat sessions until symptoms abate.

12. **For cancer:** This condition usually requires an aggressive approach. Depending on the guidance from your health practitioner and even the equipment you're using, the following guidelines may need to be modified.
- ◆ Use organ support frequencies daily.
 - ◆ Spend from 1½ to 2½ hours for each session. Some people do 2 sessions per day.
 - ◆ There are two major frequencies that everyone needs that should be used every day. See Chapter 5, **Cancer**, for more information.
 - ◆ Each frequency is run for about 3 minutes, based on the penetration power of the average unit. But sometimes a frequency needs to be run for 5, 15, 30 or even 60 minutes. And some rifiers use a single frequency for 2 hours, with excellent results. It depends on your situation.
 - ◆ Researchers discovered that the lower hertz (Hz) frequencies work well for most conditions, but cancer *might* be better managed by the higher megahertz (MHz) frequencies. Use a machine that can transmit in this range so you can use Rife's original frequencies (or revised numbers close to them), and / or the laboratory-tested cancer frequencies from Jimmie Holman. If your machine can't reach that high, set it to transmit a square wave, whose higher harmonics will give you some benefits of a higher main frequency.
 - ◆ Some researchers suggest that if you have too many frequencies to fit into one day, create two days of programming and alternate the programs every other day. This is not optimal.
 - ◆ If you feel a lot worse after a session, this may indicate microbial die-off. Do detox protocols.
 - ◆ Rifting intensifies the effects of chemo. If you do both, your liver and kidneys could be overwhelmed with poisons. Consult a doctor knowledgeable about Rife Therapy. Some people undergoing chemo stop the sessions until a few days afterwards, but this may make your condition worse and isn't recommended.
 - ◆ Most people feel better within a month, and sometimes within days. If you don't notice any change after several weeks of sessions, consult a practitioner who can monitor your condition. Also, consider changing your protocol and adding more complementary therapies (reread Chapter 5, **Cancer**).
- ◆ Some people use two rife machines at the same time. See Chapter 5, **Cancer**.
 - ◆ Even after they are feeling better, most people give themselves at least one session per day for about 4 to 6 months. This ensures that the cancer will not return.
13. **For Lyme disease:** Of all the infectious conditions, Lyme is one of the most difficult to treat. You must closely monitor your body and responses to know when to focus on Lyme, on co-infections, or on restoring the body (such as addressing adrenal fatigue and/or replenishing nutrients) independent of disabling pathogens. The enormous amount of die-off from microbial waste—plus the body's depletion and weakened state of mind—make it necessary to start sessions with less time per frequency and more time between sessions. When first rifting, do no more than 1 minute per frequency. Leave enough time between sessions (at least 2 to 3 days) to recover.
14. **Write down your responses to all of the frequencies used in the session, whether positive, negative or neutral.** A written record of your physical, mental and emotional responses can help determine which frequencies were *hits* (produced a discernible response), and which frequencies did not work. This record will also help you plan a long term health protocol. In addition, your reports may be useful to others, should you decide to share your results.
15. **Drink water in sufficient amounts, appropriate to your weight, size and toxicity level.** The water should contain liquid minerals (electrolytes), chlorophyll, Vitamin C, or lemon to make it more assimilable. If you won't drink water, don't give yourself sessions, or you'll risk toxification from the microbial waste that results from the sessions.
16. **Don't interrupt the sessions until you're completely well.** People who take a break from rifting before their illness is completely gone may experience a recurrence. Sometimes, the frequencies they were using no longer work for them because the pathogens have developed a resistance to the frequencies. Be persistent about continuing with your program, *especially if you have cancer, Lyme, or a hard-to-treat condition.*

Continue to Part II

Part II. Troubleshooting

Let's assume that:

(a) Your unit is working properly.

(b) The signal is being received by the body.

(c) You have done everything suggested in Part I.

People are biochemically and physiologically unique. Differences in water, fat, and muscle content and density may cause your body to process the frequencies differently than the body of someone else. Also your diet, external climate, geographical location, hormone levels, electropollution, and even phases of the moon may cause the pathogens to mutate slightly and behave in unpredictable ways, leading to unexpected frequency variations. If you are still not achieving the desired results or your condition worsens, see a health practitioner. Meanwhile, try the following:

1. **Do longer sessions.** You may need to spend more time per frequency, or do additional frequencies. Some people find relief running one frequency for 45 minutes or longer.
2. **Use different frequencies.** Not only can pathogens undergo changes (mentioned at the top of this page), but for any given condition—such as a respiratory infection, dental infection or even arthritis—any number of two dozen possible microbes might be involved. Consider all possibilities, including the chance that if you received a medical diagnosis, it may be incorrect. You may want to use a custom frequency service (see Appendix A).
3. **Drink more mineralized water.** If wastes are accumulating faster than the body can eliminate them, water will dilute the toxins to a more manageable level.
4. **Heal your adrenals.** Adrenal hyperactivity or exhaustion can halt your progress. In many cases, it can cause normally helpful therapies not to work, or to have unexpected or opposite effects.
5. **Make sure that your thyroid gland is working properly, and that your cells are absorbing adequate amounts of thyroid hormone.** Hypothyroidism—either from insufficient hormone output by the gland, or the inability of the cells to receive and process the hormone—can exacerbate and cause other conditions, ranging from cancer to fibromyalgia to heart disease. Fifty percent of the North American population likely suffers from hypothyroidism. For more information, see Chapter 5, **Glands, Thyroid**.
6. **Use the regeneration and healing frequencies.** Your system may not be working optimally even if pathogens are not involved. Focus on glandular and organ support. Some frequencies (especially 40K), rather than devitalizing harmful microbes, stimulate the body's cells to repair and regenerate. You can run 40K all day if you like.
7. **Run frequencies for Candida and parasites, even if you think you aren't affected.** It's amazing how many conditions are either caused or exacerbated by fungi and parasites.
8. **Run frequencies for Staph and Strep, even if you think you aren't affected.** Many people have subclinical levels of these bacteria yet are asymptomatic. Or, symptoms they've learned to live with are due to the presence of these pathogens. Rifer and nutritionist Dr. Richard Loyd has discovered that with a surprisingly large number of people, even moderate levels of *Staph* and *Strep* in the body prevent correctly targeted frequencies for other conditions from working.
9. **Run frequencies for mold and mold toxins, even if you think you aren't affected.** One-quarter of the population cannot eliminate mold toxins, whose buildup in the body can impair progress no matter what other protocols are used. See Chapter 5 for details.
10. **Run frequencies for toxicity due to chemicals, heavy metals, and drugs.** All illnesses—including cancers, neurological disorders (Multiple Sclerosis, Alzheimer's, etc.) and respiratory problems—are caused or exacerbated by chemical poisoning. Contaminants are in our air, food, water, vehicle and factory exhaust, cosmetics, cleaners, carpets, construction materials, and more. Make your personal environment free of chemicals.
11. **Eliminate gluten and dairy from the diet.** Gluten damages the lining of the gut and can cause brain fog. In some individuals, it causes immune malfunction. For some, dairy has similar effects. See Chapter 4, **Food**.
12. **Use detoxification protocols for the liver, colon, and perhaps the kidneys.** Most conditions can be helped by an herbal parasite purge, colonic, sauna, or chelation to eliminate heavy metals. See Chapter 3, **Detoxification**, and Chapter 5, **Chemical Sensitivity / Poisoning**.
13. **Correct the problems caused by MTHFR.** Nearly half the population suffers from almost unlimited problems due to the inability to synthesize folate. See Chapter 3, **Nutritional Supplements**.

14. **Run frequencies for Lyme, even if you think you aren't affected.** Lyme has become astonishingly prevalent and can mimic so many other disorders that it's worth rifting for it. Lyme is complex and difficult to eradicate. See Chapter 5.
 15. **Eliminate electrosmog.** Harmful electromagnetic fields cause pathogens to proliferate and impair cell function. See Chapter 1, **How We Become Ill**.
 16. **Eliminate silver-mercury amalgam fillings.** The mercury in fillings continually leaks, as vapor, into the mouth. Even at parts per billion (ppb) amounts, mercury is highly toxic! Some homeopathic remedies and electromedical devices can nullify the effects of mercury. You may require chelation (see Chapter 5, **Chemical Sensitivity / Poisoning and Dental**). If possible, get your amalgams removed a holistic dentist.
 17. **Eliminate mouth infection.** The mouth is a potent breeding ground for bacteria and the teeth are connected to every meridian in the body. Thus, "local" infections starting in the mouth can migrate, and cause even apparently unrelated conditions including heart attacks.
 18. **Try Chinese Medicine diagnosis.** There are relationships among all organs, glands and body systems. You might not be able to affect your condition with frequencies specifically for that condition, but focusing on related points may help. For instance, the spleen "controls" the mouth and lymph; so if the spleen has deficient or excess energy, you could have a gum infection or clogged lymph vessels. Similarly, the kidneys "control" bone health; so if the kidneys are weak, you could suffer bone loss (osteoporosis). These relationships may not make sense to the Western mind, but they're still valid. Many acupuncturists obtain excellent results using pad units for hard-to-treat conditions by placing the electrodes at the site of meridians and acupuncture points.
 19. **Reassess your lifestyle: diet, exercise, sleep, stress, and contaminant levels.** Some people use Rife Therapy allopathically: they zap pathogens to eliminate disease without paying attention to what made them ill in the first place. If your diet is high in carbohydrates, sugars and fake food, you'll feed the pathogens. Don't underestimate the importance of food in becoming and remaining healthy. Similarly, if you don't get enough sleep or the proper exercise, and don't manage stress, you may remain ill. See Chapter 1, **How We Become Ill**, and Chapter 3.
 20. **Eliminate radiation stress.** Everyone on the planet is affected by high levels of radioactivity. See Chapter 3, **Detoxification**, for details.
 21. **Try other therapies.** If you're drinking enough mineralized water (and are using the correct frequencies) and you feel fatigued, congested, nauseated, thirsty, and/or have flu-like symptoms, try some protocols discussed in Chapter 3, **Detoxification**. If you're still not getting the results you want, consider adding another option such as Spectro-Chrome color therapy. Rife technology is compatible with virtually all holistic modalities. It has been used somewhat less successfully in conjunction with allopathic medicine (drugs), although people do combine rifting and medically necessary surgery with good results.
 22. **Learn to release, manage and make peace with your emotions, and eliminate any beliefs that may contribute to being ill.** Some frequencies provide relief from emotions such as anger. This makes sense, because microorganisms constantly excrete poisonous wastes that cross the blood-brain barrier and damage the brain. The brain is the primary organ of emotions, perception, sensory input, motor function, and cognition. Therefore, toxins can affect mood, motor coordination and the ability to think, as well as exacerbate or outright cause numerous neurological disorders. Approaching emotional and mental issues from a psychological perspective is important too. See Chapter 3 and Appendix A for more information on some easy-to-use, self-help therapies.
 23. **Be aware that there are some conditions that rifting may not be able to correct.** These include permanent damage caused by nutritional deficiencies, damage due to drugs or toxic chemicals, severe trauma due to surgery or mechanical injury, and damage due to the effects of electromagnetic radiation as long as the radiation continues to exist. However, it can't hurt to try. Some of the frequencies may at least help regenerate tissue or alleviate pain.
- If you have a medical condition, consult a qualified professional. If you are rifting, find someone familiar with Rife Therapy, such as a naturopath, chiropractor, osteopath, herbalist, acupuncturist, or holistic physician.*

		<i>Uterus, Cervix, Ovaries</i> <i>and Fallopian Tubes</i>	843
		<i>Vagina, Labia and Clitoris</i>	844

CHAPTER 5

Frequency Directory

GETTING STARTED—READ THIS FIRST!

These next few pages are critical. They describe how the Frequency Directory is organized. At the end of the instructions is an outline of all the categories contained in the Frequency Directory.

Every entry in this Directory is in alphabetical order. In straight alphabetical order you will find:

1. The *pathogen* involved in the symptom picture. For example: **ENTAMOEBA HISTOLYTICA**, the parasite that causes amoebic dysentery, is under **E**.
2. A *general symptom*. For example: **DIARRHEA** (which might or might not be a symptom of amoebic dysentery caused by *Entamoeba histolytica*), is under **D**.
3. The *medical term for the disease*. For example: **AMOEBC DYSENTERY** is under **A**.

Exception: The medical term for a disease will *not* be listed separately when the disease name derives from the pathogen itself. For example, “Borreliosis” designates the disease caused by any number of *Borrelia* bacterial strains. The alphabetical listing therefore contains both terms:

Borrelia, all types / **Borreliosis**

Most of the time, after you find an alphabetical listing you’ll be told to see the entry under a specific category (discussed in a moment).

THE CATEGORIES

An alphabetical listing will sometimes be self-contained and complete entry if a condition cannot be easily classified.

- ◆ **Example #1: PRIONS / AMYLOIDOSIS**
- ◆ **Example #2: FIBROMYALGIA**
- ◆ **Example #3: CALCIUM METABOLISM AND UTILIZATION, TO IMPROVE**

The above examples are not typical, however. Usually, when you reach the alphabetized term you’ll be directed to the appropriate category to obtain the complete listing. A complete listing consists of descriptive text—origin of the condition, who is most susceptible to the condition, co-infections that might occur with the main condition you’re addressing, complementary therapies—and, of course, the frequencies for that condition.

Most of what you’re looking for will be found under one of four possible categories:

1. *Pathogen*
2. *Affected Body Part or Body System*
3. *Common Name of Condition*
4. *Stand-Alone Entry*

Each is discussed on the following pages.

1. **Pathogen.** Whenever possible, each disease is linked to a particular pathogen or pathogens. The harmful microbes appear under one of the following:

- a. **BACTERIA**
- b. **CANDIDA, FUNGI, MOLDS AND YEASTS**
- c. **PARASITES, PROTOZOA AND WORMS**
- d. **VIRUSES**

In these pathogen categories, entries are listed first with the name of the pathogen, then with the medical name for the disease, and then with the common name(s) of the disease, if there are any.

- ◆ **Example #1:** You are looking up **LYME DISEASE** in alphabetical order. So you go to **L**. You see:

LYME DISEASE

See “*Borrelia*, all types / Borreliosis / Lyme Disease” under **BACTERIA**.

If you’re accustomed to calling Lyme by either the name of one of its strains, *Borrelia burgdorferi*, or the medical term “Borreliosis,” you go to **B**. There, you are directed to the listing for the pathogen:

BORRELIA, ALL TYPES / BORRELIOSIS

See under **BACTERIA**.

- ◆ **Example #2:** You are looking up a specific pathogen, *Herpes zoster*, in alphabetical order. So you go to **H**. You see:

HERPES, ALL TYPES

See under **VIRUSES**.

The **VIRUSES** section has a general *Herpes* section, which is further subdivided into the various *Herpes* viruses, each of which is responsible for different symptoms (usually in different areas of the body).

- ◆ **Example #3:** You are looking up the disease Shingles in alphabetical order. So you go to **S**. You see:

SHINGLES

See under **SKIN**, under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, or see “*Herpes Virus Type 3 / Herpes zoster / Chicken Pox / Varicella / Shingles*” under **VIRUSES, Herpes, all types**.

The *Herpes zoster* virus that causes Shingles is listed in three places: (1) large category of **VIRUSES** and its subcategory “*Herpes, all types*”; (2) category of affected body part **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**; (3) category of affected body part **SKIN**.

2. **Affected Body Part or Body System.** The majority of all entries in the Frequency Directory are listed according to where the symptoms appear, such as:

- ◆ **BONE AND SKELETON**
- ◆ **GASTROINTESTINAL TRACT**
- ◆ **GLANDS**
- ◆ **MEN** (body parts specific to men)
- ◆ **MUSCLES**
- ◆ **RESPIRATORY TRACT**
- ◆ **URINARY TRACT**
- ◆ **WOMEN** (body parts specific to women)
- . . . etc.

Some of the body part categories are further divided into subcategories. For example:

- ◆ **GASTROINTESTINAL TRACT**
 - Systemic Conditions*
 - Colon / Large Intestine*
 - Small Intestine*
 - Stomach and Esophagus*
- ◆ **GLANDS**
 - Adrenals*
 - Pancreas*
 - Parathyroid*
 - Pineal*
 - Pituitary*
 - Thymus*
 - Thyroid*

You will find it very useful to look for frequencies according to the body part or system that’s affected, because when browsing, you may find other frequencies that apply to your situation.

- ◆ **Example #1:** For **DUODENITIS**, go to **D**. You’ll see:

DUODENITIS

See under **GASTROINTESTINAL TRACT, Small Intestine**.

- ◆ **Example #2:** For **CROHN’S DISEASE**, go to **C**. You’ll see:

CROHN’S DISEASE

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

Cancer is an exception. All cancers, no matter what part of the body they appear in, are listed under **CANCER** because cancer is a life-threatening condition that can migrate, and the protocol for all types is basically the same.

3. **Common Name of Condition.** Some conditions are listed *solely* as generic terms or symptoms. For example:

- ◆ INJURIES
- ◆ INSECT BITES
- ◆ TUMORS, BENIGN . . . and so on.

4. **Stand-Alone Entry.** A few entries that are not easily classified under other categories appear alphabetically as self-contained, stand-alone entries.

- ◆ **Example:** For **PRIONS / AMYLOIDOSIS**, go to **P** where it's listed in alphabetical order. This is the only place in which it appears.

EXPLANATORY TEXT IN EACH ENTRY

Each complete entry—in other words, an entry that's not simply a redirect line—contains many possible names for a condition, a description of symptoms, and the frequencies that eliminate or manage the symptom picture. Many entries also summarize how the pathogen is transmitted, and suggest therapies that complement rife sessions or can be used by themselves if you don't have a rife machine.

DIFFERENT FREQUENCY POSSIBILITIES

In most cases, the frequencies are listed from the lowest to the highest.

Many of the entries are divided into several sets.

1. The first frequency sets in an entry consist of the numbers that the majority of experimenters find most useful for that condition. *Frequencies associated with known experienced researchers are considered primary.* It will be stated when the numbers come from such sources (John Garvey, Richard Loyd, Jeff Sutherland, Jimmie Holman, and others). The exception to this “known experimenters come first” rule is the Hulda Clark frequencies. Due to the complexity of her listings, her data is usually listed last.
2. Subsequent frequency sets (if any appear) may be for related conditions, possibly relating to co-infections.
3. More frequency sets (if they appear) might or might not be helpful. They might devitalize pathogens, or prove helpful to the body in other ways such as tissue rejuvenation or some other effect or benefit.

ABBREVIATIONS, NUMBERS, PUNCTUATION

Hertz. Abbreviated **Hz**. Each Hz is one cycle per second. *Relation to frequency numbers:* Most of the numbers designating frequencies are in Hz. For example:

464 is 464 Hz
522 is 522 Hz
2008 is 2008 Hz

Kilohertz. Abbreviated **KHz**. “Thousands of hertz.”

When you see a “K” after a number, add three zeros: 000.

5K = 5000 Hz
10K = 10000 Hz
20K = 20000 Hz
40K = 40000 Hz

When a plus sign (+) is present. Sometimes a plus sign connects several numbers. In the 1980s, a Rife researcher advised running numbers together, connected by a plus sign, in the same session based on the theory that they worked synergistically. *If you find that you don't need all the numbers in the group, don't use them.*

When a decimal point—punctuation that looks like a period or dot (.)—exists within a number. (This is *different* from the system, used in many European countries, that depicts commas instead of periods or dots for decimal points.)

Some frequencies may contain more than one decimal place. Decimals are important, so use them if possible. If your unit can't handle decimals, program a sweep. For example: If your unit can output 9 or 10 but not 9.6, sweep from 9 to 10, which will cover 9.6. Allow extra time for a sweep to ensure that your equipment will dwell for a long enough time on 9.6 to accomplish your goal.

When a comma (,) is present. A comma separates each frequency from the next when used *between* numbers. Ordinarily, the comma is *not* part of a number. Therefore, rifiers in Europe who use commas instead of periods to indicate decimals, should note that the comma does *not* indicate a decimal. A comma is part of a number *only* when the frequency is in the millions of hertz and there is a *semicolon* between each frequency (see below).

When a semicolon (;) is present. Some entries contain frequencies in the millions of hertz. Occasionally, one of these numbers can be easier to read if it contains commas. In such a case, a *semicolon* instead of a comma is used *to separate each individual frequency*.

LENGTH OF TIME FOR EACH FREQUENCY

The usual amount of time for each frequency is 3 minutes, unless otherwise specified. However, different machines have different penetration power and each user has different needs. Thus, some equipment may require less or more time. Experiment to see what works best for you.

THE SCOON AND HOLLAND EFFECTS

After experimenting with more effective ways to deliver frequencies, Dr. Richard Loyd devised the following, named after prominent Rife researchers:

- ◆ **The Scoon Effect.** You'll need either two radiant plasma units, or the Atelier Robin F165 electrode device, which can run two frequencies simultaneously. All equipment must be able to output frequencies to at least one decimal point place. On one plasma unit, run the main frequency and on the other plasma unit, run a secondary frequency 1 Hz above the primary frequency. On the F165 frequency generator, run both frequencies. (Example: 727 Hz and 728 Hz, at the same time.)
- ◆ **The Holland Effect.** Using two radiant plasma units, run the primary frequency on one and on the other, the 11th harmonic of the primary frequency. (Example: 1000 Hz and 11,000 Hz at the same time.)

MANY FREQUENCIES ARE EXPERIMENTAL

When you see entries that contain long lists of frequencies, it's easy to become overwhelmed. Remember that some of these numbers are *experimental*. Some rifers have found them helpful, while others haven't noticed many (or any) significant benefits. These numbers must be considered possibilities rather than definites. The exceptions are those frequencies that were calculated by Royal Rife himself; or in a laboratory using methods similar to those used by Rife; or by researchers who counted the increase or decrease in pathogens after the colonies were exposed to the frequency fields. Some of the numbers were calculated with mathematical formulas, using measurements derived from the pathogens themselves. Still other numbers—found to be surprisingly accurate—were obtained through dowsing or muscle testing (see Chapter 4).

Keep in mind, however, that the most accurate lab-tested frequencies might not work for you if your equipment's signal does not penetrate the body. Even if it does, there may be mutations in the pathogen—depending on the terrain (you), which includes the larger environment (climate and geography). Focus on *how you feel* after your session. “Experimental” means: You observe. You change your approach when necessary. And you keep learning. These frequencies are guidelines only, starting points.

BEING LINEAR ABOUT A HOLISTIC SYSTEM

Cataloguing illness and wellness in creating this chapter presented some challenges. Establishment medicine teaches us that such-and-such a pathogen “causes” such-and-such a disease. Yet why do some people become ill from a pathogen while others, living in the same environment or neighborhood or even home, don't? The bodily terrain is heavily influenced by the foods we eat, our level of exercise, our attitudes, our emotions—even the intangibles we inherited from our ancestors. These, and more, play a huge role in determining why some people and not others get sick. On the other hand, so many volatile microorganisms (including genetically engineered superbugs) have appeared since Royal Rife's time that even mentally and physically well-balanced people can become ill. So, on some levels, a cause-and-effect relationship between microorganisms and disease cannot be denied.

My use of the word “cause” to link a pathogen to a disease is not meant to deny the many factors involved in health (or deny our ability to heal). The word “cause” also saves a lot of space. So, when I say that a pathogen “causes” instead of “is implicated in” a disease, understand that I am making a shorthand report within a very narrow paradigm.

Classifying microorganisms is much harder than you might think. Due to their pleomorphism, the divisions between bacteria, fungi and viruses—some of which behave and appear in ways that defy their own categories—is sometimes a struggle even for experienced pathologists. Nonetheless, conventional labeling systems are still useful.

I also found it difficult at times to organize the body. For example, the immune system was once regarded as comprised solely of the immune cell factories: the lymph nodes, the thymus, and the bone marrow. But hormones formerly regarded as immune-related are now exceeding their boundaries. Where exactly *is* the immune system? The entire body is an immune system! This is why I refer to immune *response*, immune *function*, immune *cells*.

The heart was challenging, too. It is well known that the heart is an organ. But this organ is also comprised of muscle fiber. Plus, recent research has shown that the heart secretes a hormone, thus sharing some characteristics with endocrine glands. Not only that, 65% of the heart contains nerve cells that are receptive to neurotransmitters—which we used to think belonged only in the brain! How, then, should the heart be classified? A similar conundrum exists with bone and fat cells. Scientists have discovered that both these types of tissue secrete hormones (again, the former province of the endocrine system). And many of us already know that the gut produces and responds to neurotransmitters—which once we believed were unique to brain function. What on earth is going on?

The takeaway? Human beings are difficult to classify. We are so much more than the sum of our body's cells, systems, biochemicals and electrical impulses—or even the pathogens that inhabit us, no matter how many there are.

OUTLINE OF CATEGORIES IN THIS FREQUENCY DIRECTORY

Here again is the list of categories—without the page numbers,
in the same typeface as it appears in the text.

This list does *not* include single, stand-alone entries, which are in alphabetical order.

ARTHRITIS

BACTERIA

BLOOD SUGAR PROBLEMS

BONE AND SKELETON

BRAIN AND NERVOUS SYSTEM,

MIND AND EMOTIONS

CANCER

CANDIDA, FUNGI, MOLDS AND YEASTS

CHEMICAL SENSITIVITY / POISONING

DENTAL

Mouth and Gums

Teeth

EARS

EYES

GASTROINTESTINAL TRACT

Systemic Conditions

Colon / Large Intestine

Small Intestine

Stomach and Esophagus

GLANDS

Adrenals

Pancreas

Parathyroid

Pineal

Pituitary

Thymus

Thyroid

HEADACHE

HEART, BLOOD AND CIRCULATION

INJURIES

INSECT BITES

LIVER AND GALLBLADDER

Liver

Gallbladder

LYMPHATIC SYSTEM

MEN

Penis

Prostate

Sexual Function

Testicles

Urinary

MUSCLES

PARASITES, PROTOZOA AND WORMS

REGENERATION AND HEALING

RESPIRATORY TRACT

Lungs

Nose and Sinuses

Throat and Lymph Nodes

Vocal Cords

SKIN

TUBERCULOSIS, ALL TYPES

TUMORS, BENIGN

URINARY TRACT

Bladder and Urethra

Kidneys

VIRUSES

WOMEN

Breasts

Menstruation and Menopause

Sexual Function

Uterus, Cervix, Ovaries and Fallopian Tubes

Vagina, Labia and Clitoris

You now have all the tools you need
to use this Frequency Directory effectively.
Please refer to the beginner guidelines again as needed.

Also, before you begin, please review
“A Short Course on How to Give Yourself a Rife Session”
at the end of Chapter 4.

—A—

ABDOMINAL INFLAMMATION, PAIN, AND INFECTIONS

See all abdominal conditions under **GASTROINTESTINAL TRACT**, *Colon / Large Intestine*.

ABSCESS, GENERAL

Cavity formed by the disintegration of tissue, which creates pus, an accumulation of dead white blood cells. This can occur anywhere in the body, including the mouth. Also see **BACTERIA**, “*Staphylococcus pyogenes aureus*,” as this pathogen is a frequent cause of abscesses; and **DENTAL**, *Mouth and Gums*. 190, 428, 444 + 1865, 450, 464, 500, 566, 587, 660 + 690 + 727, 760, 787, 802 + 1550, 880, 2170, 2720

ACANTHAMOEBA KERATITIS

See “*Acanthamoeba castellanii* / Acanthamoeba Keratitis” under **PARASITES, PROTOZOA AND WORMS**.

ACID REFLUX

See under **GASTROINTESTINAL TRACT**, *Stomach and Esophagus*.

ACIDOSIS

Occurs when the kidneys and lungs cannot keep the body’s pH in balance. See a health professional; this condition is more complex than one might think, with many possible causes. It could even be life-threatening.

ACNE

See under **SKIN**.

ACTINOBACILLUS

See under **BACTERIA**.

ACTINOMYCES / ACTINOMYCOSIS, ALL TYPES

See under **BACTERIA**.

ADDICTION TO FOOD, ALCOHOL OR DRUGS

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

ADDISON’S DISEASE

See under **GLANDS**, *Adrenals*.

ADENOIDS, SWOLLEN

See under **LYMPHATIC SYSTEM** or **RESPIRATORY TRACT**, *Throat and Lymph Nodes*.

ADENOMA, CERVICAL

See “Cervical Adenoma” under **WOMEN**, *Uterus, Cervix, Ovaries, and Fallopian Tubes*.

ADENOVIRUS, ALL TYPES

See under **VIRUSES**.

ADHESION

See “Adhesion / Scar” under **SKIN**.

ADNEXITIS

See “Fallopian Tube Inflammation / Adnexitis” under **WOMEN**, *Uterus, Cervix, Ovaries and Fallopian Tubes*.

ADRENAL GLAND CONDITIONS

See under **GLANDS**, *Adrenals*.

ADYNAMIA, GERIATRIC

See **FATIGUE, GERIATRIC / ADYNAMIA**.

AFLATOXIN

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

AFRICAN TRYPANOSOMIASIS

See “*Trypanosoma brucei gambiense* / African trypanosomiasis / Sleeping Sickness” under **PARASITES, PROTOZOA AND WORMS**.

AGITATION

See “Akathisia / Agitation” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

AIDS (ACQUIRED IMMUNE DEFICIENCY SYNDROME)

See “HIV (Human Immunodeficiency Virus) / AIDS (Acquired Immune Deficiency Syndrome)” under **VIRUSES**.

AKATHISIA / AGITATION

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

ALCOHOLISM

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

ALLERGIES, GENERAL

The inability of the body to properly assimilate, process, break down, neutralize or excrete an offending substance in the form of a food or airborne plant particle (usually a protein). Symptoms of airborne or foodborne allergy may include a runny nose; red, itchy, watering eyes; sneezing; dark circles under the eyes; headache; hives or other skin rash; digestive distress; and fatigue. Foodborne allergies may additionally cause constipation, diarrhea, gas, and leaky gut.

The body can regard any food as an irritant, but there’s a difference between a genuine food *allergy* and food *intolerance*. True immune-mediated allergies (there are several types) constitute overreaction by the body’s immune cells which, in response to the ingestion of a food or nutrient, mobilize and sometimes even attack the body’s own tissues. A food intolerance (mistakenly called “allergy”) is the inability of the body to absorb or assimilate nutrients from food, usually related to a digestive malfunction. Regardless of the provocation, the body should not be exhibiting these abnormal reactions. Overreactions to nourishing food that’s not spoiled, sprayed with pesticides, or genetically engineered, can be caused by insufficient digestive enzyme production, an overworked liver, infections, or even unbalanced meridians, which cause the body to become stuck in a negative faulty electrical feedback loop. Practitioner-administered Nambudripad’s Allergy Elimination Technique

(NAET) may correct imbalances (see Chapter 3 Insert on page 388, “Food and Nutrient Allergies”). The following protocol can be self-administered: Hold the irritant (“allergan”) close to or against your body while scanning the entire surface of each ear for 30 seconds with a 635–660 nm LED. (A low-power laser will work too, but an LED is safer; see Appendix C.) The ears contain the acupuncture points for the entire body. This will help the body dump toxins. For additional information and other perspectives, see *Food Allergies and Food Intolerance* by Brostoff and Gamlin.

For foodborne allergies, see **GASTROINTESTINAL TRACT, Systemic Conditions; PARASITES, PROTOZOA AND WORMS;** and **CANDIDA, FUNGI, MOLDS AND YEASTS.** For airborne allergies, see **RESPIRATORY TRACT, Nose and Sinuses.** Allergies can also relate to a sluggish liver, so see **LIVER AND GALLBLADDER.** Also see **GLANDS, Adrenals,** which are intimately involved in allergies due to the role these glands play in stress. In the meantime, here are frequencies to try: 30, 33, 254, 303, 330, 430, 470, 484, 610, 620, 624, 644, 646, 690, 727, 740, 742.4, 787, 790, 864, 866, 880, 1234, 1550, 1918, 2213, 2600, 2650, 2900, 2950, 986, 4412, 5148, 7344

Allergy to Dust Mites

Mites live in furniture, drapery, pillows and carpet, and feed on the dead skin cells of humans. Allergies are generally not to the mites themselves but to the large amounts of feces they generate and expel into the air. If these frequencies work, it's unclear whether they kill dust mites or whether they reduce sensitivity to the fecal matter. From Dr. Hulda Clark: 707K or 1752.48 (for units unable to emit KHz)

Allergy to Pollen

Pathogens grow on pollen. Experimental:
116113, 119061.03, 119441.8

Allergy to Ragweed

473

ALTITUDE SICKNESS

Chest pain, weakness, and difficulty breathing resulting from a rapid change in air pressure and oxygen levels. Nitric oxide supplements will help increase circulation.

ALOPECIA

See **HAIR LOSS / ALOPECIA.**

ALS (AMYOTROPHIC LATERAL SCLEROSIS)

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

ALTERNARIA TENUIS

See under **CANDIDA, FUNGI, MOLDS AND YEASTS.**

ALZHEIMER'S DISEASE

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

AMOEBA HEPAR ABSCESS

See under **LIVER AND GALLBLADDER, Liver.**

AMOEBAS, ALL TYPES

See under **PARASITES, PROTOZOA AND WORMS.**

AMOEbic DYSENTERY / DYSENTERY

See “*Entamoeba histolytica* / Amoebic Dysentery” under **GASTROINTESTINAL TRACT, Systemic Conditions** or under **PARASITES, PROTOZOA AND WORMS.**

AMYLOIDOSIS

See **PRIONS / AMYLOIDOSIS.**

AMYOTROPHIC LATERAL SCLEROSIS (ALS)

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

ANAPHYLACTIC SHOCK / ANAPHYLAXIS

See **SERUM SICKNESS / ANAPHYLAXIS / PROTEIN SENSITIZATION.**

ANCYLOSTOMA CANINUM

See under **PARASITES, PROTOZOA AND WORMS.**

ANEMIA, OXYGEN DEFICIENT AND SICKLE CELL

See under **HEART, BLOOD AND CIRCULATION.**

ALUMINUM, DETOXIFYING FROM

See “Mercury, Aluminum, and Other Contaminants” under **CHEMICAL SENSITIVITY / POISONING.**

ANEURYSM

See under **HEART, BLOOD AND CIRCULATION.**

ANGINA PECTORIS

See under **HEART, BLOOD AND CIRCULATION.**

ANKYLOSING SPONDYLITIS

See under **ARTHRITIS.**

ANOSMIA

See “Smell, Loss of / Anosmia” under **RESPIRATORY TRACT, Nose and Sinuses.**

ANTHRAX AND ITS SPORES

See “*Bacillus anthracis* / Anthrax” and “*Bacillus anthracis* Spores” under **BACTERIA.**

ANUS, ITCHING

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine.**

APHTHOVIRUS

See under **VIRUSES.**

APOPLEXY

See “Stroke Paralysis / Apoplexy” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

APPENDICITIS

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

APPETITE, EXCESSIVE OR LACK OF

Appetite abnormalities have several probable, deeper causes. Check for depression and serotonin deficiency. See **BLOOD SUGAR PROBLEMS**; *Candida albicans* under **CANDIDA, FUNGI, MOLDS AND YEASTS**; **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**; **PARASITES, PROTOZOA AND WORMS**; **GLANDS, Thyroid**; and **GLANDS, Adrenals**.

ARM PAIN

See “Neuralgia, Brachial” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

ARTERIAL SPASM

See “Intermittent Claudication” under **HEART, BLOOD AND CIRCULATION**.

ARTERIOSCLEROSIS

See under **HEART, BLOOD AND CIRCULATION**.

ARTERY, DILATION OF

See “Aneurysm” under **HEART, BLOOD AND CIRCULATION**.

ARTHRITIS

Arthritis (sometimes called “arthrosis” or “arthranguia”) simply means “swelling in the joints.” Inflammation and pain are linked to stress and weak immunity. The source of stress could be toxins such as vaccines, emotional distress (often anger), infection, allergies, overweight, excessive or improper use of joints and muscles, poor posture, metabolic imbalance, or injury. Common to all or most of these stressors is waste, which can come from many sources. Just a few sources are vaccines (which contain toxic chemicals and pieces of pathogens that invade the host’s DNA); emotional distress (which causes acidic stress hormones to pour into the blood, on which bacteria feed); or even metabolic imbalances (to preserve the pH integrity of the bloodstream, the body may deposit accumulated wastes in the joints). The injury type of arthritis can result from rupture of a tendon, ligament, muscle, or joint (the rubbery cartilage cushion between bones). Pathogens involved may be those responsible for rheumatic fever, gonorrhea, tuberculosis, or (according to some research) German measles. Some bacteria produce calcium phosphate shells to protect themselves and hide from the host’s immune cells. If these lumps of crystallized calcium lodge in the joints and muscles, we suffer from arthritis.

Even after one recovers from an illness, subclinical levels of harmful microbes may lie dormant, erupting when the systemic terrain is once again favorable to their repopulation. If you feel that you never completely recuperated from a particular illness; if you observed ill effects from vaccines; or if you were vaccinated and felt no ill effects but are still concerned about the possible mutation of the inoculation microbes into more virulent ones, you can use frequencies as a prevention against arthritis.

Avoid fake foods and adulterated dairy (see Chapter 3, **Food**). Eliminate all nightshades (tomatoes, eggplant, white potatoes, tobacco, bell and hot peppers). In some individuals, these plants hinder the metabolism and absorption of calcium and phosphorous, leading to inflammation, muscle spasms, pain, and stiffness due to deposits in connective tissue, damage to ligaments and tendons, mineralization on the walls of major arteries and veins, and changes in bone density. Studies show that over 70% of subjects saw moderate to significant improvement after removing nightshades. If you do eat them, you can minimize their effects by supplementing with calcium, magnesium, and Vitamin K2 during the meal.

When rifting for specific joints, use a pad device. Place electrode patches on either side of the affected area. Also try, for arthritis and any other type of pain, the Magnetex®. The magnetic vortex it creates literally pulls debris out of the tissues (see Appendices A and C for details). Massage only between flare-ups—otherwise, the tissue will become irritated. Moderate exercise grows capillaries and builds circulation. On painful areas, try heat or ice, whichever feels better. Drink plenty of clean water.

Also see **BACTERIA**, “*Mycoplasma*, many types,” as these pathogens have often been found in the blood of people with various forms of arthritis. Worms are implicated in arthritis, so also see, under **PARASITES, PROTOZOA AND WORMS**: “*Ascaris lumbricoides* / Roundworm,” “Hookworm, probably *Necator americanus*,” “*Strongyloides stercoralis* / Threadworm,” and “*Trichinella spiralis* / Trichinosis.” Frequencies alone won’t eliminate worms; so see other modalities (including herbs and color therapy), also in that section. Also see **CARTILAGE PRESERVATION**. And see **VIRUSES**, “*Rubella* / German Measles / 3-Day Measles,” as a high percentage of children with juvenile arthritis may harbor this pathogen.

First try: 2720 (for pain), 40K (for cell restoration).

Then try (from Jimmie Holman. These frequencies may work only on equipment made by Pulsed Technologies): 30720, 30784, 38400, 40K (for as long as desired), 40960, 41600, 43520, 43712, 44032, 46528, 48K, 49024, 49600, 49664, 50368, 51200, 51328, 53248, 56320

Then try (also from Holman): 31539, 32K, 32768, 38461, 38502, 42240, 44160, 46592, 49280, 50816, 51328, 56320, 57344, 58880

Then try (some of these are from Michael Tigchelaar): 1.2 + 250, 1.5 (for 10 minutes), 3 + 230, 7.69, 7.7, 9.39, 9.4, 9.6, 10, 20, 25, 26, 28, 30, 40, 60, 76.9, 80, 93.9, 96, 100, 120 (for 20 minutes), 120, 150, 727, 512, 600 + 625 + 650, 660 + 690 + 727, 683, 688, 766, 770, 776, 787, 802 + 1550, 1664, 800, 880, 962, 1500, 1664, 2720, 3K, 3176, 5K, 10K

Ankylosing Spondylitis / Bechterew’s Disease

A degenerative inflammatory condition of the spine and adjacent soft tissues, and often the hip and shoulder joints, causing pain and sometimes fever, anemia and fatigue.

1.2 + 250, 7.69, 7.7, 10, 28, 35, 60 + 100, 95, 110, 428, 600 + 625 + 650, 680, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 3K, 40K

What Is Arthr-itis?

Medical terms for the layperson

During my first quarter of graduate school, I had to take a course in medical terminology. As I found out early on, chiropractic school was not much different from medical school. We had to learn to diagnose and, interestingly enough, terminology was the key to diagnosis.

One of the first words we learned in that class was the term “-itis.” *Itis* is Latin for “inflammation of.” Other terminology included some words that probably sound familiar to you:

- ◆ *Arthro* means *joint*.
- ◆ *Stoma* means *stomach*.
- ◆ *Bursa* is short for the *fluid-filled sack* in many joints.
- ◆ *Fibro* means *muscle fiber*.
- ◆ *Mya* means *muscle*.
- ◆ *Cepha* means *head*.
- ◆ *Tendons* connect bones.
- ◆ *Ligaments* connect muscles to bones.

My classmates and I often laughed as we learned these words because we realized the vast majority of medical diagnoses weren’t actually “diagnoses” at all, but merely turning the name into Latin or something fancy to impress our patients. It’s also done . . . to make an impact on the patient so they’ll be satisfied they have a diagnosis. So if you’re told you have “arthr-itis,” “tendon-itis,” “burs-itis” or “stomat-itis,” it means your joint, tendon, bursa sack or stomach hurts. Doctors can then follow medical protocol and write a prescription to give you drugs that will hopefully ease the pain.

“Algia” is another interesting one that means *pain*. Therefore, “Cephalgia” is a *headache*. The oft-used diagnosis, “Fibromyalgia,” means *muscle fiber pain*.

There’s one very serious problem with diagnosing: People feel they have a “condition.” Everyone knows, once you have a “condition,” you always have a “condition.” . . . [However,] Arthritis, tendonitis and fibromyalgia are not death sentences. They’re merely Latin terms, combined with fancy medical English phraseologies, for pains doctors don’t understand and conditions for which they have no effective treatment. . . . Most doctors are only diagnosing and treating side effects, not the true cause of the problem. . . .

The most common form [of arthritis that] conventional medicine treats—they refer to it as “old age” arthritis—is . . . called “osteo-arthritis” (“osteo” means *bone*, so isn’t that name hilarious!). When someone says his or her right knee has arthritis because, “I’m old,” here’s how I typically respond: “Really, how old is the other knee?” Properly functioning joints don’t degenerate.

Arthritis is an “inflamed joint.” The joints are created by ends of bones meeting. At this point, they are

cushioned by cartilage. The knee, hip, shoulder and other bigger joints have a fluid-filled sac called a bursa (“burs-itis”). The inner lining of the joint has a grease-like fluid called synovial fluid which reduces friction and allows for freedom of movement. If the joint begins to malfunction, this is often coupled by a loss of synovial fluid that would aggravate the bones meeting in the joint.

When joints become arthritic, swelling causes stiffness, rigidity and tissue damage. The body will warn you with pain if the joint moves beyond its present limits. It’s a vicious cycle because, as mobility decreases, the muscles surrounding the joint also weaken and deteriorate, allowing for further damage to the joint. Eventually, you can have cartilage, ligament and tendon damage, as well as further bone erosion.

If these joints are functioning normally and well cared for, however, they just don’t “itis.” . . . Common medical wisdom is that if you have arthritis, essentially you’re doomed. This could not be farther from the truth. The body does heal.

Arthritis is due to a physical or chemical irritant in a joint or the system. If the cause of this irritation is avoided, removed or corrected, your body has a chance to heal. . . .

The majority of carbohydrates, particularly refined carbohydrates, can aggravate and even cause degeneration. Excess acids in the system do exactly what they sound like they do: They deteriorate and damage cells. Additionally, the body’s survival mechanism will attempt to neutralize these acids. (Calcium from bone is an exemplary acid neutralizer.) Therefore, as you consume sugar, flours, grains and other refined carbohydrates, your blood stream ends up in acid overload and you actually give yourself degenerative arthritis. Dairy and caffeine are two additional major acid culprits. . . .

Think of the tires on your car. When they’re misaligned, they wear unevenly. The musculoskeletal system operates the same way. . . . The vast majority of people in today’s culture have muscular imbalance. . . . [as well as] postural imbalance. . . .

Structurally, the only person you can go to is a chiropractor. The job of a chiropractor is to balance posture and correct misalignment in the spine and other joints. . . . Chiropractic rehabilitative exercises are actually designed to cause “regeneration,” the reversal of arthritis and rehydration of discs. . . .

Arthritis is not a terminal disease. If that’s what you’ve been told, fire your doctor.

—Ben Lerner, DC, 2010

arthritis-cats-dogs.com/article-detail.php?ID=152

Nutrients and Supplements for Inflammation

- ◆ ***Boswellia serrata* (Indian Frankincense).** Herb with potent anti-inflammatory effects.
- ◆ **Chondroitin sulfate.** Found in cartilage. Promotes moisture retention and elasticity. Inhibits enzymes that break down cartilage. In bone broth too.
- ◆ **Protease, Pancreatic, Serrapeptase, Nattokinase, Lumbrokinase Enzymes.** Anti-inflammatory. Used by white blood cells to break down waste products. Take on empty stomach so intact enzymes reach bloodstream instead of being used to digest food.
- ◆ **Glucosamine sulfate.** Found in cartilage. Promotes its formation and repair. In bone broth too.
- ◆ **Magnesium.** Vital mineral involved in many functions. Relaxes muscles. Different types of magnesium have an affinity for different body areas, so take all; most people are deficient. Onto sore muscles and joints, rub magnesium "oil." You can make it yourself. Half fill jar with magnesium chloride flakes (also called *nigari*, used to make tofu). Keep adding water; shake jar until flakes dissolve and solution is saturated. Bypasses digestive tract, reaches body areas instantly.
- ◆ **Proline-Rich Polypeptides.** Also known as transfer factors. Modulates immunity: stimulates lax immune function and calms hyperactive immune cells.
- ◆ **Turmeric.** Gold-colored root used in Indian cooking. Anti-inflammatory, immune-protective, anticancer.

Arthritis related to Gout

Gout is a metabolic disease of excessive uric acid in the blood. Avoid fructose (see Chapter 3, **Food**). Also see **GOUT**.

9.39, 9.4, 20, 660 + 690 + 727, 787, 880, 3K, 10K, 40K

Arthritis related to Nervous System Paralysis

9.39, 9.4, 10K

Arthritis related to Stomach Infection

9.39, 9.4, 10K

Arthritis related to Tonsil Infection

9.39, 9.4, 10K

Arthritis with Parathyroid Disturbances

Parathyroid disturbances affect calcium metabolism and cause either an excess or deficiency of calcium.

First try: 9.6, 10K

Then try: 326, 328, 4760.5, 673.1, 771, 40K

Bunion

Inflammation and thickening of joint, often in big toe.

20, 10K, 2720, 40K

Bursitis

Inflammation of connective tissue, mainly around joints. May be caused by a great many organisms. Also experiment with the arthritis, tendomyopathy, and sprain frequencies. Because white blood cells require enzymes to break down the waste products of inflammation (as well as infection), taking enzyme supplements on an empty stomach may help.

660 + 690 + 727, 787, 880, 10K, 40K

Elbow Pain / Epicondylalgia

1.2 + 250, 26, 160, 3K, 10K

Fluid in Joints and Tissues, to Reduce Excess Amounts

15, 24.3

Hip Pain

20, 660 + 690 + 727, 787, 880, 2720, 10K, 40K

Knee Pain

See a chiropractor to rule out subluxation or other structural causes.

1.2 + 250, 3 + 230, 7.69, 7.7, 9.39, 9.4, 9.6, 20, 28, 73, 160, 660 + 690 + 727, 787, 802 + 1550, 880, 2720, 3K, 40K

Osteoarthritis

The most common form of arthritis in the United States. Symptoms usually build up gradually. In the early stages, joints may ache after physical work or exercise. Repetitive injury and physical trauma can exacerbate the condition. Older and overweight people are especially susceptible, as are women after menopause.

Cartilage is a rubbery substance in the body that cushions the bones and help the joints move easily and smoothly. Osteoarthritis begins with the erosion of cartilage between the joints of fingers, knees, hips, and spine. As cartilage breaks down, the ends of the bones thicken, may knock against each other—giving the person a “crunching” feeling or the sound of bone rubbing on bone when the joint is used—and the joint may lose its shape. Bony protrusions may start to grow where they don’t belong. Damaged joint tissue can also cause the release of biochemicals called prostaglandins, which can add to the pain and swelling.

Other symptoms include steady or intermittent pain in a joint, stiffness after periods of inactivity, swelling, and tenderness. The wrists, elbows, shoulders, and ankles can also be affected. If this condition occurs in a joint not commonly affected, there is usually a history of injury or unusual stress to that joint. Toxins excreted by bacteria into the joints also cause pain.

From Jimmie Holman (in this order): 49280, 48K, 30784

Also try: 15, 324, 326, 528, 770, 1500, 40K

Use 512 along with the other frequencies you need.

Reactive Arthritis

Called “reactive arthritis” because chronic inflammation sets in after an initial infection by one of several bacteria, including *Chlamydia trachomatis*, *Shigella flexneri*, *Salmonella*, *Yersinia*, and *Campylobacter*. The initial bacterial infection can be transmitted via sexual contact or through food. Symptoms can include pain and swelling in joints, eye inflammation, and urogenital tract discomfort including painful (burning) urination and lesions on the penis. See entries for those pathogens under **BACTERIA**.

From Dr. Hulda Clark: 394K or 976.63 (for devices unable to accommodate frequencies in the kilohertz range)

Rheumatism

Severe joint pain, inflammation and swelling, often aggravated by inclement weather. May be accompanied by fever.

376 (from Dr. John Garvey), 262, 333 + 523 + 768 + 786, 776, 829, 10K, 40K

Rheumatoid Arthritis

An autoimmune disorder with similarities to Lupus erythematosus, rheumatoid arthritis can occur suddenly. The immune cells malfunction, attacking the body’s own healthy connective tissue in the joints—as though the person’s body itself were an unwanted foreign element, like a pathogen. Inflammation of the joint lining (the synovium) can cause pain, stiffness, tenderness, heat, redness, and inflammation. The affected joint may also lose its shape, resulting in loss of normal movement. Some people develop pea- or walnut-sized lumps of tissue under the skin of the elbow, hands, back of scalp, over the knee, or on the feet and heels, called rheumatoid nodules, which may or may not be painful. Both sides of the body are usually affected at the same time.

Rheumatoid arthritis attacks more than the joints of the wrist, fingers, neck, shoulders, elbows, hips, knees, ankles, and feet. Sometimes there is inflammation of the tear glands, salivary glands, spinal column, lining of heart and lungs, and the lungs themselves. Other symptoms may include disorientation and dementia, fatigue and malaise, and occasional fever. Rheumatoid arthritis can last a long time with active symptoms, or there may be few to no symptoms. Death can occur from this disease.

Although there’s a genetic predisposition to this condition, there also must be a trigger, such as a pathogen. (See the beginning of this section about arthritis in general.) The suddenness of this condition, along with the trigger, may suggest *Mycoplasma* infection. See, under **BACTERIA**, “*Mycoplasma*, many types” and “*Mycoplasma fermentans*,” as *Mycoplasma* infection is often the beginning of autoimmune conditions; and also **BACTERIA**, “*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer,” as research from Finland shows the presence of this pathogen (which also causes ulcers) in a high percentage of people suffering from rheumatoid arthritis. Also see **BACTERIA**, “*Chlamydia trachomatis*”; **CHEMICAL**

SENSITIVITY / POISONING, “Mercury, Aluminum, and Other Contaminants”; and **PARASITES, PROTOZOA AND WORMS**, “General (unspecified).”

First try: 376 (from Dr. John Garvey), 15, 324, 528 (these three frequencies worked for one person on record), 1.2 + 250, 7.69, 7.7, 9.39, 9.4, 9.6, 25, 660 + 690 + 727

Then try: 3 + 230, 20, 28, 262, 600 + 625 + 650, 776, 787, 802 + 1550, 880, 10K, 40K

AUTOIMMUNE DISORDERS

Normally, in the early stages of infection when the body is attacked by (for example) a virus, it releases chemical messengers called *interferons* from healthy cells to help them resist infection. Lymphoid cells known as Natural Killer T Cells (or NK Cells) attach to infected body tissue. This destroys both the foreign invader and the host cell. (Destroying the host cell limits the reproduction of new viruses because they cannot reproduce without a host.) NK Cells, whose number has increased, will recognize the same foreign invaders during a future infection and react more quickly. Even *Mycoplasma* (bacteria without a cell wall), and pathogens that have mutated, possess markers that the immune cells can recognize.

Another normal immune response is the creation of antibodies, produced in response to an antigen—a foreign protein, microbe, pollen, or other substance. Antibodies neutralize the infection by binding to the virus, thus reducing its ability to attach to a cell or penetrate it. These antibodies also help the body resist becoming reinfected.

Common Autoimmune Disorders

- ◆ Addison's disease
- ◆ Arthritis
- ◆ Celiac disease
- ◆ Crohn's
- ◆ Diabetes (some forms)
- ◆ Graves' Disease
- ◆ Guillain-Barre Syndrome
- ◆ Hashimoto's thyroiditis
- ◆ Lupus erythematosus
- ◆ Myasthenia gravis
- ◆ Multiple sclerosis
- ◆ Pernicious anemia
- ◆ Polyarteritis nodosa
- ◆ Polymyalgia rheumatica
- ◆ Psoriasis
- ◆ Raynaud's phenomenon
- ◆ Rheumatoid arthritis
- ◆ Sarcoidosis
- ◆ Sjogren's syndrome
- ◆ Ulcerative colitis

The body's immune response, however can malfunction. With chronic viral conditions such as Epstein-Barr, HIV and AIDS, the viruses attempt to slow the immune response by infecting the immune cells themselves. This is a clever survival tool for the virus because malfunctioning immune cells cannot respond to protect the host. With autoimmune disorders, the body's NK Cells attack the person's own tissues as though the tissues were foreign invaders. Autoimmune disorders are often due to the presence of tiny *Mycoplasma*—so-called “stealth pathogens”—whose lack of a cell wall enables them to invade our cells. The NK cells sense something hiding in our tissue, and attack. If *Mycoplasma* invade the central nervous system, the disease is Multiple Sclerosis (although MS can also have a non-autoimmune origin). If *Mycoplasma* invade our joints, the disease is rheumatoid arthritis. If the body attacks its own tissues that it mistakes for foreign proteins, resulting in a severe inflammatory response anywhere, the disease is Lupus erythematosus. If there is severe, progressive muscular weakness—causing difficulty in swallowing and breathing that can lead to death—the condition is Myasthenia gravis. If certain symptoms manifest in the thyroid, it's called Graves' (Basedow's) Disease. Fibromyalgia, a syndrome of assorted symptoms rather than a disease per se, is considered an immune disorder as well. The biofilms created by pathogens can also cause or exacerbate autoimmune conditions.

Vaccines, which are specifically designed to stimulate an immune response, do this to such an extent that the body is forced into an abnormal, hyper-responsive state. For more information, see Chapter 1, **The Vaccine Controversy**.

A body that cannot respond effectively to current or future pathogens needs a supportive foundation. Ozone therapy (see Chapter 3, **Oxygen Therapies**) not only destroys pathogens and abnormal cells, but helps maintain the health of normal cells. Build up the body through nutrition. Holistic clinics give raw green vegetable juices to people with life-threatening and chronic conditions. Fresh lemon juice in pure water is a potent liver detoxifier. Lemon also cleans and restores the receptor sites of cell membranes. If you're on hormone replacements, note that estrogen may interfere with proper immune function and trigger autoimmune diseases. There are different forms of estrogen as well as estrogen precursors, to which women respond differently.

Supplement with proline-rich polypeptides (PRPs, also called transfer factors). PRPs are “immune messenger molecules” that pass information among immune cells about what type of external or internal threat is present, and how the body should respond to this threat. They are present in colostrum, produced by nursing animals and humans before milk is produced. Because the amino acid sequences are the same in the colostrum of all species, supplements made from colostrum extracts of, say, a cow will work for humans. PRPs activate whatever healthy NK Cells are still in the body before an infection becomes entrenched. PRPs create, and educate, a large number of Helper T Cells involved in the manufacture of neutralizing antibodies. (T Cells are specific for a given virus. They circulate throughout the bloodstream to seek and destroy cells that have been virally infected.) PRPs also help restore body cells that are damaged.

Inflammation is always a component of autoimmune disorders. Pathogens are a common source of inflammation; there may be a chronic, underlying condition.

Another contributor to autoimmune conditions is hypothyroidism, which is either underactivity of the thyroid gland or the inability of the cells to properly utilize thyroid hormone. Over half the hypothyroid population suffers from excess mucin, a sugar-protein compound normally present in connective tissue. Accumulation of the hydrophilic (water-loving) mucin damages the connective tissue of skin, blood vessels, lymph channels, muscles, nerves, and other parts of the body. Lupus, a disorder of the connective tissue, is one of many conditions that could be corrected with proper thyroid hormone supplementation (see **GLANDS, Thyroid**, “Thyroid, Underactive / Hypothyroidism”).

Researchers have discovered that biofilms from certain pathogens in the gut can also trigger an autoimmune response, so see, under **BACTERIA**, “*E. coli* / *Escherichia coli*,” “*Salmonella* / Food Poisoning,” and “*Mycoplasma*, many types.” A major weakener of the body's immune function is toxins, so also see the many entries under **CHEMICAL SENSITIVITY / POISONING**. Also see, under **LYMPHATIC SYSTEM**, “Spleen, Enlarged, and other Conditions” and “Thymus Conditions.” .24, 1.2 + 250, 3, 5.09, 7.69, 7.7, 9.39, 9.4, 9.6, 20, 28, 32.5, 75.85, 95.75, 146, 175, 456, 464, 522, 600 + 625 + 650, 660 + 690 + 727, 776, 784, 787, 800, 802 + 1550, 880, 927, 1850, 10K, 40K (which restores cell function.)

AVIAN FLU

BACILLUS, MANY VARIETIES

See under **BACTERIA**. (This includes *B. coli*.)

BACKACHE, INCLUDING SPASMS

See under **INJURIES**.

BACTERIA

Conventional medicine notes three classes of harmful bacteria: 1) *Bacilli*, shaped like rods; 2) *Cocci*, spherical in shape and exist singly, in pairs, chain formation or clusters; and 3) *Spirilla*, formed like a spiral or corkscrew, singly or in segments. Most bacteria reproduce through cell division (dividing themselves in half), although very large bacteria create “babies” inside the parent cell, which are then released through a small slit in the parent’s cell wall. Some bacteria thrive in an aerobic or oxygen-rich environment, while others are anaerobic, living only in an absence of oxygen. Still others adapt to their environment, surviving both aerobically and anaerobically. Because bacteria are larger than viruses, most can be seen individually under a microscope.

Bacteria feed on diseased organisms—further fermenting tissues that still possess some vitality—as well as on already dead material. What we experience as disease is either due to an attack by microbes (as when they destroy red blood cells), or the poisonous waste products (including pus and gas) that the pathogens excrete into the bloodstream and surrounding cells. Some types of very tiny bacteria form calcium phosphate shells around themselves to protect themselves from the host’s immune cells. These lumps of crystallized calcium are implicated in many disease conditions, including arthritis, stroke, cancer, back pain, and even Alzheimer’s.

Recently it has become apparent that the divisions between various pathogens is less distinct than was previously thought. Nevertheless, the conventional labeling systems are still useful. If you don’t know the classification of a specific pathogen, look up its name in this Directory according to its first letter; all conditions are alphabetized.

If you are using the correct frequencies but feel no relief, see **PARASITES, PROTOZOA AND WORMS**, “General (unspecified).” Parasites in the system can slow or prevent the healing from any other condition. Also, if your illness stems from, or is related to, conditions in your gastrointestinal tract, you’ll benefit from friendly flora (as fermented food or in supplements). If more friendly flora reside in the gut, fewer pathogenic bacteria will be able to survive there.

***Actinomyces bovis* / Actinomycosis (in animals)**

Found in the oral cavity of mammals (primarily cattle), this bacterium can infect the brain, jaw, lungs, and gastrointestinal tract. It causes infections with lesions and swelling in the teeth and jaw (commonly called “lumpy jaw”). According to some scientists, *Streptothrix* was a previous term for this pathogen, though others claim that the two are distinct. Also see “*Actinomyces israelii*,” below. From Royal Rife, possibly used on his #4 machine: 192K Then try: 488, 565, 672, 674, 678, 766, 768, 773 (an important frequency), 773–778 (sweep), 822, 885, 887, 7877, 9687, 42664, 42666, 46668, 46787

Actinomyces israelii* / Aggregatibacter**Actinomycetemcomitans* / Actinomycosis (in humans)**

All *Actinomyces* strains form branched networks of hyphae (threadlike tendrils) when in colonies, so they’re often assumed to be fungi when they are bacteria that are mostly anaerobic (thrive in the absence of oxygen). These bacteria help form compost (they produce enzymes that help degrade plants); but in the body they cause actinomycosis of the brain, lungs, gastrointestinal tract, sinuses, or jaw. Infection usually manifests as lumps in the neck and head, a sinus infection, or a dental infection featuring pus-filled cavities in the mouth. (Pus is an accumulation of dead white blood cells.) Try all *Actinomyces* frequencies.

First try (Dr. Loyd and Dr. Garvey): 262, 358, 787, 2154 Then try: 20, 23, 46.5, 73, 160, 222, 465, 488, 567, 660, 690, 727, 747, 766, 776, 787, 802, 880, 1550, 1600, 1800, 2154, 2489, 2720, 7880

***Bacillus anthracis* / Anthrax**

Bacillus anthracis causes anthrax, an infectious, sometimes fatal disease of warm-blooded animals (especially cattle and sheep). It transmits to humans through contact with animal hair and hides. Symptoms include ulcerous sores in the lungs or gastrointestinal tract and an accumulation of dead white blood cells. Risk of infection is not very high.

From Royal Rife, possibly used on his #4 machine: 139200

From Dr. Marty Monahan: 193, 224, 329, 410, 420, 585, 930

From Dr. John Garvey: 633

Long set (some numbers from M. Tigchelaar): 129, 224, 273, 400, 414, 420, 500, 768, 900, 930, 768, 1365, 1370, 1665, 4K. Also 622, 623, 624, 627, 628, 629, 632, 633, 634, 637, 638, 639, 642, 643, 644. With so many numbers that close together, do a 45-minute sweep

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

393500 (lowest), 395K (optimal), and 398K (highest)
363200 (lowest), 364K (optimal), and 365300 (highest)
359400 (lowest), 368K (optimal), and 370500 (highest)

The Battle of Bacteria and Biofilms for Your Body

Introduction. In the 1600s, the Dutch scientist Anton van Leeuwenhoek, known as the “Father of Microbiology,” studied his own dental plaque under a microscope and discovered bacteria. But it was not until the 1970s that scientists began to understand how complex bacteria really are. Despite their size, bacteria—and other pathogens—are not passive or without strategy. They have highly sophisticated ways to transform themselves and their environment, which allows them to survive in adverse conditions. As long ago as 1992, scientists had learned that “Bacteria Are Found to Thrive on a Rich Social Life.”

These single-celled creatures, long viewed as independent and self sufficient . . . lead a rich social life. . . . They travel in packs, cooperate and are willing to be sacrificed so their fellows may survive. Some aggregate so closely as to mimic a multi-cellular organism.

. . . When [some types of] bacteria are exposed to noxious chemicals . . . they secrete amino acids that direct them to aggregate in tight little spheres for protection. . . . An invading bacterium seems to signal others to join it. The groups of bacteria that congregate in certain body tissues then clump together to resist attacks by antibiotics. . . . [Bacteria] display an even greater degree of cooperation during times of [food] scarcity. Faced with starvation, the bacteria turn into tough spores, resistant to freezing and drying, in which they survive in suspended animation. The individual spores clump together, a hundred thousand or so at a time into a cylinder.

The bacteria also have a signal that is emitted when there are enough of them—10,000 to 100,000. . . . The signal that this density has been attained is a mixture of eight amino acids. On sensing it, the cells group together and form into a pile as neatly ordered as logs in a cord of wood. . . . [One doctor] was fascinated by the “fantastic geometric patterns” made in Petri dishes by colonies of *E. coli* and *Salmonella typhimurium*. . . . The patterns seemed to her to be clear evidence that the bacteria must somehow be communicating with each other.¹

Herbalist Stephen Buhner believes that because pathogens have other methods of self-protection, the recent emphasis on the dangers of biofilm is exaggerated. Other professionals (as well as many people who are seriously ill) disagree.

Biofilm and Its Microorganism Creators. Biofilm is constructed from proteins, polysaccharides (sugars), and fibrin (a protein the body uses to clot blood), which gives the biofilms structure. But it also contains “food”: heavy metals, toxins, and particles of the host’s DNA. The host’s DNA also prevents the immune cells from attacking (because the biofilm is seen as belonging to the host). Biofilm forms when free-floating pathogens land on a surface and produce the hard, thick, adhesive-like slime. Researchers describe biofilm clusters under a microscope as elaborate, three-dimensional glue tower structures. Most biofilms range in thickness from a few microns to hundreds of microns (one micron is one-millionth of a meter). It is difficult to eliminate these colonies because biofilm is so gooey. Biofilm allows microorganisms to:

- ◆ Stick to a living or non-living surface with glue-like tenacity.
- ◆ Form into colonies.
- ◆ Protect themselves from the host’s immune cells that try to eliminate them, and from agents that can disable or kill them such as herbs, pharmaceuticals, and frequency therapy.
- ◆ Communicate with each other and act as one organism with a single consciousness.

Biofilm can stick to almost any type of material—metal, plastic, soil, human and animal tissue—as long as the material contains moisture or has water around it.

Bacteria that form biofilms or become members of biofilm communities may possess cell walls, lack them altogether, or be in their L-form state. As many as 300 different species of bacteria can form biofilms in the mouth (which we know of as plaque). Different microorganisms can inhabit one biofilm colony: fungi, protozoa, and even algae and worm-like organisms. Some researchers state that in the case of Lyme disease, members of a biofilm colony may merge with *Borrelia* and create a hybrid organism. Also, biofilms spread. Plaque (biofilm) in the mouth is known to induce infections elsewhere in the body—such as in the brain (strokes and dementia), and in the heart (cardiovascular disease).

Biofilm colonies have their own metabolism. They develop a complicated architecture, which usually contains channels through which nutrients flow and waste leaves. In colonies with more than one type of microorganism (a common occurrence), each pathogen utilizes different nutrients, thus avoiding competition and making the community stronger.

Where Biofilm is Found. Scientists recognize that biofilms have existed for millennia. In fact, biofilms have been identified in Australian deep sea fossils that are 3.2 billion years old. Biofilms can lodge anywhere: on the surface of stagnant pools, on contaminated food, on pebbles at the bottom of a stream, on the surfaces of your kitchen sink and bathtub, in your toilet bowl, and even on your contact lenses and medical implants.

Biofilms also live in human and animal bodies, which contain many moist surfaces (blood, saliva, urine, mucosal tissue). The familiar hard, yellowish dental plaque on your teeth is a common form of biofilm, made by a complex clump of living, communicating cells.

How Biofilm Colonies Communicate. The members of biofilm colonies communicate by sending molecular signals to one another, a method known as *quorum sensing*. If a bacterium is by itself, it will secrete a long signal molecule; if part of a community, it will secrete a shorter one. When the signals between the microorganisms become strong enough, the pathogens respond and behave as a single entity or consciousness. Pathogens may decide to cluster together more tightly to evade the host's immune cells, or to make space for new pathogens. They will also signal when leaving the site—as single (planktonic) cells—to begin new colonies. Incredibly, quorum sensing can occur within a single species of pathogen or between diverse species.

Diseases and Biofilms. According to the National Institutes of Health, more than 65% of all microbial infections are caused by biofilms. Biofilms have been found on the removed tissue of 80% of patients undergoing surgery for chronic sinusitis. Biofilms cause the formation of kidney stones, which are produced by bacteria and minerals that the bacteria seize from the urine. In people with endocarditis (inflammation of the inner layers of the heart), biofilms are often living on a cardiac valve. Pathogens in vaginal tissue and tampon fibers can also form biofilms, causing inflammation and Toxic Shock Syndrome. The sludge covering diabetic wounds is largely made up of biofilms. In one study, biofilms were shown to infect children with chronic ear infections. Biofilms play a major role in autoimmune and inflammatory diseases, and even cause most of the infections associated with contact lens use.

Biofilms are especially problematic in the case of Lyme. Although Lyme disease is caused by various *Borrelia* strains, most Lyme sufferers harbor many other infectious microbes, or co-infections, that live in the *Borrelia* biofilm matrix. In many cases, these co-infections—such as *Babesia* and *Bartonella*—may cause symptoms equal in severity to *Borrelia*. *Babesia* may even cause death.

How to Destroy Biofilms. Bacteria, fungi, viruses, and other microorganisms that live inside biofilm can be up to a thousand times more resistant to being destroyed by antimicrobials (antibiotics, the body's own immune cells, or Rife Therapy) than planktonic or free-floating bacteria. The longer the biofilm remains, the more ordered and structured the tightly knit communities become, and the more difficult it is to penetrate the hard sticky shields. Pathogens can join together on almost any surface and form a protective matrix at any time. Although biofilms grow slowly, they can easily infect new tissues—either by rippling or rolling across a surface, or by detaching in clumps. It's to the colony's advantage to keep the host alive—otherwise, the pathogens will no longer have a place to live. So the host's immune defenses are allowed to keep the biofilms *somewhat* contained. But the infection never really leaves. This has enormous repercussions for people with chronic diseases involving multiple pathogens (such as Lyme and its co-infections).

Medicine has treated disease based on the assumption that all pathogens are planktonic (free-floating). This approach may be largely due to the greater ease of culturing individual microorganisms than whole biofilm colonies. But as more researchers understand that most pathogens live in mixed communities that form slime for protection, the methods previously used to eliminate infections will change. *Biofilms must be broken up first before the pathogens living inside can be killed.*

In some instances, low doses of antibiotic drugs have been found to pierce biofilms. Some doctors prescribe taking, stopping, and then re-taking the drugs to lull any remaining persistent pathogens into not replicating during the “stopping” phase, which allows the next drug dose to eradicate them. However, antibiotics are toxic. There are quite a number of safe, natural substitutes for drugs that can pierce biofilms. Once the biofilms are penetrated, other therapies can reach the pathogens and eliminate them. *During this stage, all substances must be taken in therapeutic (large) amounts!*

◆ **Enzymes.** Lumbrokinase, mucolase, nattokinase, and serrapeptase. Don't eat for 2 hours beforehand—otherwise, the enzymes will be used to digest food and won't reach the bloodstream to eat biofilms. Take 1 tablespoon of lecithin with the enzymes to help them reach the biofilm. After an hour, use the “killing” method of choice. *Don't take the enzymes without doing a “killing” treatment afterward!* Otherwise, you'll simply release the pathogens, which will then cause infections elsewhere. Protein-digesting enzymes thin the blood, so consult your doctor if you're taking a blood thinner or have blood clotting problems.

- ◆ **N-Acetyl-Cysteine (NAC) / N-Acetyl-L-Cysteine.** This nutrient is converted by the body into the amino acid cysteine and then into the antioxidant glutathione, which prevents liver damage. NAC is antibacterial and antifungal, inhibits biofilm formation by 62%, and penetrates and destroys deep biofilm layers. For neurological disorders, serious respiratory illnesses (it thins mucus), gastrointestinal infections, and dental disease (and plaque). Also improves insulin sensitivity, blocks cancer cell formation, and reduces cravings f.
- ◆ **Essential Oils (EOs).** Three essential oils inhibit the formation of biofilms, break down biofilms that have already formed, and target the pathogens directly responsible for producing the biofilms: peppermint, rosemary, and tea tree. Other essential oils have been found to inhibit the quorum sensing (communication abilities) of certain pathogens. Rose, geranium, lavender, and rosemary (which also bursts biofilm) affect *E. coli*. Clove bud, lavender, peppermint, and (to a lesser extent) cinnamon bark inhibit the quorum sensing abilities of *Pseudomonas aeruginosa*. EOs are potent. Use them with carrier oils.
- ◆ **Herbs: Terminalia chebula, Moringa oleifera, Cistus incanus, neem.** Burst biofilms and help destroy what lives in them. They also help strengthen the body.
- ◆ **Colloidal Silver.** Destroys *Staphylococcus aureus* (among other pathogens) and also its biofilms.

How to Destroy Pathogenic Microorganisms. Biofilm colonies can contain many different pathogens—bacteria, fungi, parasites, and even newly formed composite pathogens. Biofilms exist in layers. Each layer must be dismantled in succession, every time revealing new microorganisms inside. Not all methods will kill every pathogen, or work every time, so they should be rotated. These are *non-drug* approaches.

- ◆ **Colloidal Silver.** Made by passing current between two pure silver wires immersed in distilled water, the colloid particles (less than .015 microns) and smaller silver atoms and ions (.230 nanometers) kill one-celled bacteria and viruses (but not multi-cellular protozoa and worms) as long as it can directly touch them. Silver also reduces inflammation, normalizes cell and tissue function, and helps immune cells work more efficiently. See Chapter 3, **Colloidal Silver**, for details.
- ◆ **Essential Oils.** In addition to those mentioned above, lemon and lemongrass can kill some pathogens. Tea tree, rosemary, thyme, and especially oregano are antibacterial, antifungal, and antiviral. Use with care.
- ◆ **Microbe-Killing Herbs.** Besides those already mentioned are aloe vera, cat's claw, frankincense (*Boswellia*), grapefruit seed (not grapeseed) extract, hydrangea root, *Mimosa pudica*, neem, olive leaf, pau d'arco, sarsaparilla (*Smilax officinalis*), and turmeric.
- ◆ **Monolaurin, Lauric Acid.** Antiviral and antibacterial.
- ◆ **Adaptogenic Herbs For Immune Function.** Immune-stimulating herbs such as echinacea raise the number and function of immune cells. *Adaptogenic* herbs regulate or normalize immune function by lowering the activity of overactive immune cells and raising the activity of sluggish ones. Such herbs are completely safe, have broad health applications, and reduce mental and physical stress. The true adaptogens (without possible unwanted other effects) include ashwagandha, astragalus, eleuthero (misleadingly called "Siberian" ginseng), red (Asian) ginseng, white (American) ginseng, holy basil, jiaogulan (*Gynostemma*), rhodiola, and schisandra.
- ◆ **Proline-Rich Polypeptides (PRPs) or Transfer Factors.** The messenger molecules in colostrum, the thin fluid that precedes the milk from a nursing mammal. The immune cells are told to multiply, recognize foreign invaders now and in the future, disable pathogens, and avoid attacking the body's own tissue.
- ◆ **Vitamin C.** The best form is ascorbic acid, unbound to minerals. Strengthens blood vessel walls and helps protect cell membranes from invading pathogens. Loose stool indicates that you're taking too much; more is tolerated if taken in its liposomal form (see Chapter 3, **Nutritional Supplements**). Take one gram every hour. Dihydroquercetin (a flavonoid in grape leaf extract) makes Vitamin C last longer by replacing its spent electrons. Alpha lipoic acid also helps recycle Vitamin C in the body. Don't eat sugar, which attaches to the same cell receptor sites as Vitamin C and thus interferes with its absorption.
- ◆ **Vitamin D3.** A hormone made by the skin if there's enough sun exposure. Also in clean fatty animal foods. D3 builds bone, supports immunity, and more.
- ◆ **MMS (Miracle Mineral Supplement) / Sodium Chlorite.** When activated by a mild food acid, such as citric acid or lemon juice, this preparation becomes chlorine dioxide. Chlorine dioxide has a unique ability to oxidize pathogens and toxins (like ozone), but it completely breaks down into harmless substances. Very effective and safe when properly used. Begin with 4 drops every hour, work up to 20 drops. Avoid food for 2 hours before.
- ◆ **UV Light and Ozone.** Ozone kills almost any pathogen, as does Ultraviolet-C light, which eliminates pathogens almost instantly. Consumers can't afford hospital grade UV units, but can buy portable ozone generators (see Chapter 3, **Oxygen Therapies**).

Hz sets:

975.39 (lowest), 979.11 (optimal), and 986.54 (highest)
900.28 (lowest), 902.27 (optimal), and 905.49 (highest)
890.86 (lowest), 912.18 (optimal), and 918.38 (highest)

Clark sweep: 359–399.

***Bacillus anthracis* Spores**

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 386950 (lowest), 388K (optimal), 391450 (highest)

Hz set: 959.15 (lowest), 961.76 (optimal), and 970.31 (highest)

Also from Clark: 386.95 to 391.45

***Bacillus botulinum* / Botulism / Food Poisoning**

Bacillus botulinum produces a potent neurotoxin, from spoiled food that has been improperly canned or left unrefrigerated in hot weather. Causes nausea, vomiting, intense abdominal cramping, fatigue, headache, difficulty swallowing, distorted vision, diarrhea, paralysis, and sometimes shock and unconsciousness leading to death. Also see the “*Salmonella*” entries in this section; and **CHEMICAL SENSITIVITY / POISONING**.

Bacillus cereus

Found in soil or on vegetables, causing diarrhea, nausea and vomiting.

926.19, 928.28, 928.29, 931.6, 462.89, 18645.25, 18645.26, 11676.55, 11703.12, 11745.3, 374500

Bacillus coli* or *B. coli

See “*E. coli* / *Escherichia coli*” in this section.

Bacillus licheniformis

This bacterium has different forms, producing short and long rods, cocci, and branched filaments that superficially resemble a fungus. It can morph into cancer.

From Dr. Jeff Sutherland: 2655, 21554

From M. Tigchelaar: 334, 1675, 1722, 2008, 2111.3, 2127, 2127.5, 2155.4, 2385, 2521, 2663, 2655, 2674.9, 4254.73, 5655.65, 5355.67, 6265.62, 7356, 8020, 8655.4

Bacillus subtilis

Found in the gastrointestinal tract of humans and ruminants, it survives high heat and causes cramps, nausea and vomiting, and diarrhea. It also causes eye infections.

From Dr. John Garvey: 432, 722, 822, 1246

Bacillus thuringiensis

520, 902, 1405, 2551

Bacteroides fragilis

Causes diarrhea if it passes from gut into bloodstream.

565 (from Dr. Richard Loyd), Sweep 633–637

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

324300 (lowest) and 325K (optimal and highest)

325700 (lowest) and 326K (optimal and highest)

Hz sets:

803.86 (lowest) and 805.59 (optimal and highest)

807.33 (lowest) and 808.07 (optimal and highest)

Also from Clark: 16180.80, 16230.58, 808.07, 805.59

Bartonella bovis

Infects cattle but can affect other mammals and humans. Symptoms are similar to those of *Bartonella quintana*. Run with a 2 Hz sweep, in decimal increments.

344.6

Bartonella henselae

Similar in effects to strain below.

From Richard Loyd: 878

***Bartonella quintana* / Bartonellosis / Febris Wolhynia / Wolhynia Fever / Trench Fever / Quintan Fever / Shin Bone Fever**

The infection from *Bartonella quintana* has been called by many names. It was called “Urban Trench Fever” because it affected the homeless, alcohol abusers, and inner-city folk of low income. It was called “Trench Fever” during World War I because the symptoms were first noted in Allied soldiers who fought in the trenches. The bacterium itself has also changed names. A member of the *Rickettsia* family, it used to be called *Rochalimaea quintana*, but was reclassified as *Bartonella quintana*.

Several *Bartonella* species live in North Africa, Mexico, and North America. Some are spread by sand flies in the Andes Mountains of Peru, Columbia and Ecuador. Others are carried by fleas, body lice, various species of biting and wingless flies, and ticks. In California within the last decade, five different strains of *Bartonella* were identified.

Bartonella quintana was originally thought to proliferate in the gut of the body louse (an insect), but it’s now found in the lining of blood vessels. Originally the disease was transmitted by rubbing infected louse feces into chafed skin or the whites of the eyes (conjunctiva). However, with the proliferation of tick-borne illnesses, people with Lyme disease are prone to other co-infections as well, which include *Bartonella*. This disease is not secondary to Lyme, but a tenacious and harmful illness in its own right.

Early signs of Bartonellosis can be sudden: fleeting rash, high fever, fatigue, headache, swollen glands, and endocarditis (infection of heart and large blood vessels). Symptoms also include back and leg pain, especially in the shins (which gave the disease one of its nicknames). Long-

term sufferers report continued neurological symptoms: leg and arm numbness, unsteady gait, balance problems, blurred vision, memory loss, and tremors. *Bartonella quintana* also causes lesions similar to those in HIV. A universal symptom is joint pain. Recovery can be hard and relapses are common if only conventional means are used.

Bartonella reproduces quickly, so rife two to three times a day. Also see “*Borrelia*, all types / Borreliosis / Lyme Disease” in this section, as *Borrelia* often occurs together with Lyme and *Bartonella*.

From Dr. Richard Loyd: 364, 379, 645, 654, 786, 840, 842, 844, 846, 848, 850, 857, 878, 967, 6878, 634, 696, 716, 1518, 9658

Also try: 356, 547, and especially 832 and 1518

Also try: 7776665.66 or 7776665.67

Biofilms

A sticky, hard, structured formation produced by many types of pathogens, that protects them from harm and helps them adapt to their environment. With especially stubborn diseases (such as Lyme), biofilms must be destroyed before the pathogens living inside can be killed. Don't rely solely on the frequencies. See Insert, page 616, “The Battle of Bacteria and Biofilms for Your Body.”

477 (from Dr. Richard Loyd), 641.18, 543.75

Bordetella bronchiseptica / Kennel Cough

This very infectious bacterium, carried via direct contact, airborne droplets, and the sharing of contaminated items, causes inflammation of the upper airways in cats and (rarely) humans. However, it affects mainly dogs and is known as kennel cough. Symptoms include sneezing, breathing difficulty, lethargy, fever, eye and nose discharge, appetite loss, and of course coughing.

From Dr. Richard Loyd: 655

Bordetella pertussis or *Bordetella parapertussis* / Whooping Cough

Bordetella pertussis (*Bordetella parapertussis*) causes whooping cough, a serious disease that can permanently disable infants or lead to vomiting and choking, eventually causing death. Symptoms include runny nose, diarrhea, fever, and a persistent cough that (mostly in those over six months of age, before adulthood) ends with a “whoop” noise when the person breathes.

First try: 526, 765 (both from Dr. John Garvey), 46, 284, 660 + 690 + 727, 697, 906, 9101

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 329850 (lowest), 331K (optimal), and 332250 (highest)

Hz set: 817.62 (lowest), 820.47 (optimal), and 823.57 (highest)

Also from Clark: 16479.52

Also try: 776, 787, 802 + 1550, 832, 880, 1234, 7344

Borrelia, all types / Borreliosis / Lyme Disease

Lyme disease or Borreliosis is a condition of syndromes and symptoms, caused by various *Borrelia* strains (which are related to syphilis). In the host, *Borrelia* adapts to survive by morphing into three different forms according to the condition. The most well-known form is the corkscrew-shaped or spiral spirochete, which has an outer cell wall and produces symptoms. It's powerful enough to bore into bone by spinning, which partly accounts for the extreme damage it causes to the host. The second form is cell-wall-deficient (sometimes referred to as L-form), which doesn't have a cell wall and also produces symptoms. The third form, the cyst—whose dense outer capsule makes it impervious to most threats in its environment, including many pharmaceutical antibiotics—is dormant, and doesn't produce symptoms. Antibiotics typically cause the other two forms to morph into a cyst.

The immune cells cannot recognize *Borrelia* without a cell wall, and thus cannot mount a defense against it. *Borrelia* also circumvents the immune cells when it lodges in the brain and spinal cord, as pathogens in the central nervous system—which is isolated from the rest of the body—are undetectable by antibodies in the blood. The central nervous system is an ideal incubator for *Borrelia* because the spirochete expresses a new set of genes once it's in the brain. Pharmaceutical antibiotics work by breaking down bacterial cell walls, but they cannot target *Borrelia* in its cell-wall-deficient form which is impervious to drugs. The cyst form of Lyme survives antibiotics, starvation, and changes in pH and temperature. When the host's terrain is favorable to it, the cyst form will transmute back into a spirochete form. The cyst form is responsible for the relapses that some Lyme sufferers experience after months or even years of apparent good health without symptoms. The lack of a cell wall (and hence, the lack of antibodies in the system) also help explain why almost all tests for Lyme are inaccurate. If you have been diagnosed with another disease and your symptoms won't abate, you may have Lyme.

Borrelia is transmitted by insects. The most common are deer ticks, but Lyme has also been found in mosquitoes in central Europe and in sandflies in the Middle East. Lyme is also transmitted through kissing, sexual intercourse and other contact between humans; through contact between humans and animals; and contact between animals. The spirochete has been found in human blood, urine, vaginal secretions, semen, and spinal fluid. History reveals that in the 1970s, a genetically engineered form of the *Borrelia* spirochete was created at a US government biological laboratory called the Plum Island Animal Disease Center, near Lyme, Connecticut, in the US. It would have been easy for a tick to escape from the facility, migrate to the mainland, and reproduce. Although *Borrelia* is rampant in the United States, it's now found all over the world. Some especially afflicted areas include the British Isles, most of Europe, the southernmost tip of Africa, some parts of

China, and nearby Korea and Japan. Various strains of the highly adaptive pathogen include *Borrelia burgdorferi*, *Borrelia afzelii*, *Borrelia garinii*, *Borrelia lonestari* and *Borrelia valaisiana*; but there are many more. All are genetically similar to each other, and all cause Lyme disease.

Lyme often begins with a rash at the site of the insect bite. About 20% of rashes look like a bull's-eye. Others appear as a solid circle, blister, bruise (without the typical yellow coloring of a bruise), or streaks appearing anywhere on the body as the Lyme spreads.

The many devastating symptoms from the bacterium are due to its ability to induce complex responses of inflammation and autoimmunity in any part of the body. Thus, Lyme sufferers may have swollen glands, an enlarged liver, or an enlarged spleen. One's constitution and cell receptor site sensitivities determine which symptoms will appear. Common symptoms of Lyme manifest in the muscles, skeletal system and joints, causing flu-like aches, sweats, weakness, arthritis, carpal tunnel, stiffness, fever, and chills. Neurological symptoms are also common, encompassing a wide range of mental problems including mood swings, panic attacks, depression, general confusion, memory loss, and difficulty thinking. Overtly physical neurological manifestations include tremors, poor balance, insomnia, narcolepsy, slurred speech, and numbness, tingling and burning in the nerves and limbs. Digestive symptoms include indigestion, nausea, vomiting, diarrhea, and constipation. Respiratory tract symptoms include shortness of breath, cough, and chest and rib pain. Circulatory system symptoms include heart palpitations or extra beats, and vessel and heart blockage. Urinary tract symptoms include irritable bladder and interstitial cystitis. Reproductive organ symptoms include loss of sex drive, sexual dysfunction, and menstrual difficulties. Symptoms in the eyes include inflammation, double or blurry vision, oversensitivity to light, and even blindness. Symptoms in the ears include hearing impairment, buzzing and ringing, pain, oversensitivity to sound, and even deafness. Hormones may also be unbalanced.

At some point Lyme subjects will feel exhausted, with intense pain in the joints, bones and muscles. It's common to be susceptible to other infections, and have constant low body temperature (indicating thyroid underactivity), food allergies, extreme chemical sensitivity, sleep disturbances, systemic inflammation, and nutritional deficiencies. Lyme impairs the white matter in the brain, causing most people to suffer from loss of short term memory and cognitive abilities—along with brain fog, which makes it difficult for Lyme sufferers to monitor their own symptoms. Sometimes Lyme disease ends in death.

Lyme causes so many and varied symptoms that it mimics other conditions—such as Multiple Sclerosis due to the nerve damage it creates, or chronic fatigue because it's so debilitating. Not surprisingly, Lyme subjects are often diagnosed with other conditions: an autoimmune disease (Lupus or rheumatoid arthritis), cardiovascular

issues (including angina and heart failure), chronic fatigue, fibromyalgia, obsessive-compulsive disorder (OCD), schizophrenia, Bell's Palsy, cerebral palsy, Parkinson's, Alzheimer's, amyotrophic lateral sclerosis, Multiple Sclerosis, Reflex Sympathetic Dystrophy, autism, schizophrenia, or other disorders.

Lyme is very difficult to treat, not only because of its many symptoms but also because it's usually accompanied by co-infections or other pathogens: usually *Babesia* and *Bartonella*, sometimes *Ehrlichia*, sometimes *Mycoplasma*, and even parasites and worms. These pathogens hide inside biofilms—sticky, hard, almost impenetrable fortresses of slime, built on a fibrous matrix that house many different types of pathogens in organized clusters or colonies. Biofilms also contain the pathogens' food—heavy metals, toxins, and even the host's own DNA. Created by the pathogens, biofilms adhere to any surface that contains moisture. They usually block blood flow. They hide and protect the microorganisms so well that the body's immune cells cannot locate, identify or disable them, or escort them from the body. Colony inhabitants communicate with each other and routinely exhibit cooperation strategies to ensure their maximum proliferation and survival. As long as they're protected by biofilms, pathogens can lie dormant for long periods, remaining inaccessible to frequency therapies, almost all pharmaceutical antibiotics, and a fair number of herbal agents (though not all herbs). Therefore, penetrating the biofilms first is necessary to completely obliterate the disease (see Insert on page 616, "The Battle of Bacteria and Biofilms for Your Body").

As biofilms become dismantled, the top layers of infectious colonies get stripped away first, revealing deeper layers. Different pathogens often occupy successive layers, so what worked for the top layer might not work for an adjacent layer. However, prior treatments that had stopped working will probably again begin to work, as successive layers of the biofilm are removed and the current pathogen surfaces. Also, different pathogens will emerge from subsequent layers. So if *Borrelia* is first treated, it won't be in the next layer but ultimately, another layer of *Borrelia* may surface again. Thus, what was used months ago will again prove useful. When you experience a plateau—when neither an improvement nor a die-off (Herx) reaction occurs—it's time to use a new protocol, or return to a protocol that was used previously.

Ironically, even partly eliminating *Bartonella* and *Babesia* makes the *Borrelia* more active—and susceptible to being devitalized—because the co-infections help hide or protect the *Borrelia* from anti-*Borrelia* protocols. Note that after a suitable and aggressive treatment, you may feel worse. But this doesn't mean that the protocol was bad; it means that it's working, which is why there's a die-off (and you feel awful).

Most people with Lyme who consult conventional doctors don't get well, because the only treatment that

Some Favorite Holistic Therapies for Lyme

Attack Pathogens Directly

The following protocols, recommended by top researchers, focus on disabling or killing pathogens and helping to support immune function.

◆ **Pharmaceutical Antibiotics (not the most effective).**

Different forms of Lyme bacteria respond to different medications. Doctors commonly prescribe antibiotics for Lyme, assuming that the infection will be gone after just a few weeks. However, unless the antibiotics are taken within three weeks of being infected, the spirochete has had time to morph into a form that's impervious to the drugs. Also, bacterial resistance often develops before significant levels of the pathogen have been eliminated. Besides, pharmaceuticals are toxic and usually cause more problems than they solve. Many people report having taken strong antibiotics for weeks, months or even years—after which they experience only a brief, partial success followed by a severe relapse, or even no benefit at all. The best way to utilize antibiotics is in conjunction with rifeing. "When pharmaceutical or non-pharmaceutical antibiotics are in use," writes Lyme researcher Bryan Rosner, "rife machine treatments are needed less. In the same way, because of rife machine therapy, pharmaceutical and non-pharmaceutical antibiotics are needed less. . . . Rotating therapies like this also increases the antibacterial effect as you hit the elusive and resilient bacteria from different angles."² Sometimes people use other holistic protocols, especially microbe-killing herbs (discussed shortly), along with the pharmaceuticals.

◆ **Rife Therapy.** Frequencies are an excellent way to destroy pathogens. According to Rosner, Rife Therapy is unparalleled in disabling spirochetes in the bloodstream, and may be the only protocol that doesn't cause the spirochetes to defensively morph into their more dangerous forms. However, as with all protocols for Lyme, the effectiveness of Rife Therapy depends on when it's used. Even the correct frequencies from a powerful, correctly working device may not disable pathogens lurking inside protective biofilms—unless the biofilms are first destroyed. See below.

◆ **Enzymes.** Used to break apart the tough, slimy, protective biofilm layers created by pathogens, enzymes allow antimicrobial agents—whether conventional antibiotics, antimicrobial herbs or Rife Therapy—to be more effective because they'll come into direct contact with the pathogens.

Three enzymes most often used for this purpose are lumbrokinase (from earthworms), nattokinase (from fermented soy), and serrapeptase (from silkworms). (These enzymes are also used to prevent and disperse blood clots, thin the blood, and protect against inflammation. Because they, and perhaps other enzymes, thin the blood, consult a doctor if your blood has problems clotting or if you are already taking blood thinning pharmaceuticals.) Other useful enzymes include bromelain (from pineapple) and papain (from papaya). When using enzymes therapeutically, take them on an empty stomach (at least 3 hours after eating) so they'll get into the bloodstream and dissolve the biofilms instead of being used to digest food. One hour after taking the enzymes, use the method of choice to disable or kill the pathogens. If you fail to do this, you will simply release the pathogens and they'll migrate to and infect other parts of the body.

Dr. Steve Haltiwanger advises taking 1 tablespoon of lecithin with the enzymes. The lecithin helps transport the enzymes through the bloodstream so they'll reach the biofilms. This ensures that wastes and pathogens get dumped into the bloodstream, where they will then be accessible for easy removal.

◆ **Colloidal Silver (CS).** Silver is well known for its ability to destroy one-celled microorganisms. It also helps restore immune function. Some people with Lyme and other severe infections drink one or more quarts of homemade colloidal silver a day, along with other protocols. If there is a lot of die-off causing many symptoms, begin by taking small amounts. For details, see Chapter 3, **Colloidal Silver**.

◆ **Herbs.** *Terminalia chebula*, *Moringa oleifera*, *Cistus incanus*, and neem burst biofilms as well as destroy their inhabitants. They work well for Lyme (usually in combination), although it's a good idea to periodically switch herbs, as each has slightly different properties. Aloe, cat's claw, hydrangea root, olive leaf, and pau d'arco kill pathogens. Olive leaf, *Boswellia serrata*, and chaparral have anti-inflammatory properties. Teasel root relieves inflammation, restores nerves, promotes circulation, strengthens ligaments and bones, and soothes the digestive tract. *Mimosa pudica* ("sensitive" mimosa) very successfully targets Babesia and many co-infections. For Lyme, many sufferers prefer cat's claw and teasel; but everyone is different, so see how you feel. Herbalist Stephen Buhner (www.buhnerhealinglyme.com) has written some excellent books on eliminating Lyme with natural methods.

- ◆ **Essential Oils (EOs).** The essential oil form of an herb is potent. If you take EOs internally, make sure they're labeled food or therapeutic grade (intended for ingestion); dilute them in an edible "carrier" oil such as olive, coconut or sesame; and don't take too much. Peppermint, rosemary, and tea tree EOs inhibit the formation of biofilms, break down biofilms that have already formed, and target the pathogens responsible for producing those biofilms. For details, see Tisserand and Young's *Essential Oil Safety* and buhnerhealinglyme.com.
- ◆ **Salt with Vitamin C.** This "do it yourself" salt-and-C protocol gained prominence after being reviewed in a 2007 edition of *Townsend Letter*. For many people, the protocol promises not only significant relief but the permanent elimination of pathogens. The customary amounts for adults are ¼ teaspoon of pure sodium chloride along with an equal amount of Vitamin C (or 1 gram of each), taken at the same time. One teaspoon of salt equals about 6 grams. Approximately 8 to 16 grams of salt are ingested per day. Amounts taken should be relative to body weight. Thus, small children might ingest 4 to 6 grams each of the salt and Vitamin C daily.

The salt and C are taken every hour, 12 times a day—or as many times as you can tolerate. Some people start with salt and Vitamin C three times a day and gradually increase the amounts.

Commercial table salt is never used because it contains harmful additives (see Chapter 3, **Water**). Opinions differ on using purified salt vs. natural unprocessed salt such as Celtic sea salt, which not only lacks additives but contains additional minerals. Although highly beneficial, the presence of these other minerals may make it difficult to assess how much sodium you're getting. Many people prefer 1-gram sodium chloride USP tablets (pharmaceutical grade), available without prescription from most pharmacies. (See Appendix A for sources.) These tablets contain pure sodium and do not need to be measured. As for Vitamin C, most forms are acceptable. However, the buffered, non-acidic form is better tolerated than plain ascorbic acid.

How does the salt-and-C protocol work? To survive, all microorganisms rely on a delicate balance of sodium and potassium. The increase of sodium which causes a (default) decrease of potassium upsets the balance, causing the spirochete's death. A human can tolerate much more sodium than a pathogen can. Salt also increases the activity of elastase, an enzyme. This enzyme, released by a type of white blood cell, helps destroy pathogens. The Vitamin C helps rebuild and detoxify cells, and restores immune function.

This protocol is safe if you follow two guidelines. First, drink at least 8 ounces of water with each measured quantity of salt and Vitamin C. Because both salt and Vitamin C are water-soluble, drinking enough water will ensure that whatever is not being used is excreted.

The second guideline requires professional help. Many people are low in potassium. Excess sodium and not enough potassium can cause muscle pain and atrophy, and even cardiac failure. Seek medical supervision to ensure that your systemic levels of potassium and Coenzyme Q10 are sufficient.

This protocol is generally followed for six months after one's health seems normal, because Lyme in its cyst form can lie dormant in the body.

- ◆ **Hyperbaric Oxygen Therapy (HBOT) and Ozone.** These therapies feed all the cells in the body while disabling pathogens. See Chapter 3, **Oxygen Therapies**, for more information.
- ◆ **Colostrum or a constituent, Proline-Rich Polypeptides (PRPs, also known as Transfer Factors).** PRPs are tiny immunity molecules found in the colostrum of a nursing mammal for the first few days after the mother gives birth. For more information, see Chapter 1, **The Vaccine Controversy** and the **AUTOIMMUNE DISORDERS** listing in this chapter.

Nutritional Support

Fake foods and processed foods will cause severe setbacks. This includes not only sugars, but all kinds of foods containing sugars (such as fruit); heat-processed vegetable oils (such as canola); and factory farmed meats. Like sugar, carbohydrates feed pathogens and cause blood sugar spikes and other health problems, so grains (either refined or unrefined) should be limited or avoided entirely until health is restored. Seeds and selected nuts (pumpkin, sesame, almonds, walnuts, buckwheat, teff, quinoa) are a better choice; but again, most of them are high in carbohydrates so they should be eaten sparingly. Most Lyme sufferers require a so-called Paleo diet. This includes clean animal protein (such as naturally raised, grass fed beef, lamb and goat; wild caught fish; organic chicken; and pastured eggs), lots of non-starchy vegetables (especially leafy greens), and if tolerated, some seeds and nuts. Hormones tend to become very impaired in people with Lyme. The body requires fats to produce hormones, so good fats—found in coconut and olive oils, grass fed beef, and wild caught fish—are essential. Molecularly distilled fish oil can be used if clean fish is not available.

Many nutrients become depleted. It's unlikely that they can be replenished through food alone, so supplementation is suggested. These nutrients include:

- ◆ **Lithium Orotate.** The mineral lithium (*not* the drug lithium carbonate) is a vital nutrient. Lithium's ability to protect the brain make it ideal for people whose brains are severely affected by *Borrelia* toxins. Most people take between 5 mg and 15 mg, and sometimes even 30 mg a day. Medical doctor Jonathan Wright says that he administers up to 40 mg a day (depending on the need) without unwanted effects. See Chapter 1 Sidebar, page 25.
- ◆ **Manganese.** The Lyme pathogen feeds on this mineral, so levels tend to be low. Manganese helps build bone, regulates hormones and metabolic functions, assists the formation of connective tissue, and regulates blood sugar levels.
- ◆ **Magnesium.** Unlike other bacteria, the Lyme spirochete utilizes magnesium, rather than iron, to proliferate. Thus, Lyme sufferers tend to have a severe magnesium deficiency—exacerbating the magnesium deficit often seen in the population as a whole. Magnesium in the form of magnesium *malate* breaks up lactic acid accumulations that cause muscular pain. A very absorbable, assimilable form of magnesium is magnesium *chloride*. An inexpensive form of magnesium chloride is sold as flakes of nigari, the coagulating agent used to manufacture tofu. A mixture of these magnesium flakes in water or witch hazel to saturation yields magnesium "oil," called this because of its oily consistency. When rubbed on the skin, a large amount of magnesium immediately gets absorbed into the bloodstream, bypassing the digestive tract where it could cause loose stools. With transdermal absorption, much more magnesium can be taken. (If the skin itches too much from the magnesium, wet with water or use witch hazel in the formula.)
- ◆ **Coenzyme Q10.** This vital nutrient is used as an antioxidant and for energy production. It also protects the nervous system and boosts immunity. Critical for healthy heart function, Coenzyme Q10 is deficient in people with Lyme.
- ◆ **Zinc.** Zinc is an essential mineral and is involved in just about every bodily function you can imagine. It's utilized by immune cells to tag, attack, and eliminate pathogens. It's used to make DNA and hormones, it promotes digestion, and reduces inflammation. It also chelates heavy metals.
- ◆ **Vitamin C.** It helps form collagen (a component of all tissues), protects cell membranes (and prevents pathogens from entering the tissues), neutralizes free radicals and toxins, repairs wounds, helps synthesize hormones and neurotransmitters, and more. Human bodies can't make Vitamin C and must receive it from foods and nutritional supplements.

- ◆ **Alpha Lipoic Acid (ALA).** A powerful antioxidant, ALA is unusual because it's active in both water-soluble and fat-soluble areas of the cells and tissues of the body. It also regenerates Vitamins C and E, making them active in the body for longer periods.

Chelation: Two Protocols

The word chelation comes from the Greek word for "claw." A *chelator* is a substance that chelates, or binds to, heavy metals and some chemical toxins. Chelation therapy uses vitamins, minerals, antioxidants, and other ingredients to draw out and bind toxins that the body then excretes. Some chelators excel at drawing out contaminants from the tissues, while other chelators are better at binding to the contaminants once they're out of the tissues and are freely circulating in the bloodstream.

Heavy metals that commonly need to be chelated out of the body include aluminum, antimony, arsenic, cadmium, lead, mercury, and thallium. Heavy metals usurp the receptor sites of the valuable minerals that we need. Metals are also carcinogenic and cause extensive damage to all systems in the body. Finally, Lyme, *Candida albicans*, and other harmful microbes feed on heavy metals, so this major food source for them must be removed in order to help eliminate them.

Health professionals have widely varying opinions on the best way to do chelation. The administration of intravenous (IV) chelators requires numerous visits to a doctor's office, and the cost is prohibitive for most. Therefore, I will focus on two "do-it-yourself" methods.

Popular Protocol (contradicts Cutler Protocol, next)

Chelators either *pull* metals off the tissue receptor sites (*Group 1*), or *bind* to metals once they're off the receptor sites and in the bloodstream (*Group 2*). If you ingest Group 1 chelators only, the metals will be dislodged but will then get dumped back into the bloodstream, where they can migrate elsewhere in the body and cause even more damage. Just a few chelators include:

- ◆ **Zinc (Group 1).** This beneficial mineral pulls heavy metals off the receptor sites of the body's tissues.
- ◆ **Vitamin C (Group 1).** This essential nutrient combines with harmful minerals, creating a new water-soluble compound that's excreted in the urine. However, Vitamin C also binds to beneficial minerals, so supplement to replace minerals that have been lost.
- ◆ **Cilantro (Group 1).** The leaves of an herb, cilantro is often eaten as a garnish in Indian cooking. It's highly effective as a chelating agent and is most useful in that capacity when used as a tincture, *along with a chelating agent from Group 2, especially chlorella*. Amounts are 2 drops 2X day, gradually increasing the amount to 10 drops 3X a day.

- ◆ **Chlorella (Group 2).** This single-cell green algae should be “broken cell wall.” This means that its indigestible cellulose is cracked under low heat to make it bioavailable. A common dose is one hour before food and 30 minutes before the cilantro is taken. Chlorella amounts are 1 gm 3–4X a day, increasing to 3 gm 3–4X times a day. In “Dosing with Chlorella / Cilantro for Neurotoxin Elimination,” Dr. Mark McClure distinguishes between lower amounts that mobilize metals in the gut only, and higher amounts (up to three times the mobilizing dose) for systemic chelation.³ For more details, read his book.
- ◆ **EDTA / Ethylene-diamine-tetra-acetic acid (Group 2).** This synthetic amino acid was first used in the 1940s for treatment of heavy metal poisoning. It both binds *and* removes heavy metals and many other toxins. Holistic practitioners use EDTA intravenously; but it can also be taken orally as a powder or in a rectal suppository. (EDTA also significantly reduces the risk of heart attacks. One famous Swiss study found a 90% reduction in cancer mortality after EDTA chelation therapy.⁴) Be careful, though! EDTA leaches out zinc, magnesium and calcium from the tissues as well, so these valuable minerals must be replaced.
- ◆ **Activated Charcoal and Zeolite (Group 2).** These are inert adsorbents (not a typo). During adsorption, the atoms, ions or molecules of a toxic substance adhere to an adsorbent. There’s no chemical change; the charcoal or zeolite are simply drawing other materials to them, which attach to their surfaces. Charcoal is specially prepared coconut shell or wood. Zeolite is a naturally-occurring mineral. Both bind to toxins in the gut. Normally, the liver detoxifies by dumping noxious substances into the bile. However, bile recirculates in the body about a dozen times. This allows the poisons to relocate and lodge in any organ or tissue. A binding agent in the gut ensures that the toxins in the bile are excreted with the feces instead of being recirculated in the bloodstream. (For details, see Chapter 3, page 470.) However, keep in mind that these alone cannot be used for a heavy metal detox because they don’t pass into the bloodstream, but remain in the digestive tract.
- ◆ **Sodium Alginate (Groups 1 & 2).** Extracted from brown algae (*Laminaria japonica*), sodium alginate pulls metals and radioactive particles from the blood and tissues. It also binds to these materials in the digestive tract. Take 3 capsules 3X day (preferably on an empty stomach), twice a year for six weeks at a time, to ensure sufficient protection.

Cutler Protocol (contradicts Popular Protocol, prior)

After being poisoned with mercury, Princeton University research scientist Andrew Hall Cutler, PhD (recently deceased) utilized his training in biochemistry to develop this protocol. Only the basics are presented here; biochemistry details and all “how to” aspects can be found online and in his informative book, *Amalgam Illness: diagnosis and treatment*. For some, Cutler’s is the only protocol that works. Some parents report that their children completely recover from autism after eliminating mercury from the body.

Some chelators are complete or thorough (genuine) and some are incomplete (pseudo). True chelators are dithiols: they contain two thiol or sulfur groups (also called “sulfhydryl” groups). The sulfhydryl groups are spaced at the correct intervals to encapsulate heavy metal ions, forming a bond that’s strong enough to not only dislodge the metals from wherever they’re located, but also to hold on to them tightly and safely. In comparison, incomplete chelators contain only one thiol group; their ability to bind to metals is weak. The metals are dislodged from wherever they’re being stored, but they usually become dislodged again before the body can bind and excrete them. Thus, incomplete chelators simply move the metals from one location to another, which—depending on where the metal migrates—can cause more symptoms and make one’s condition worse, especially if the metals leave the bones and fat to lodge in the brain, nerves, liver, or hormone-producing glands. Cutler emphasized not to use the following *for chelation*. (People not burdened by heavy metals can safely use these ingredients, which under the right circumstances are highly beneficial.)

- ◆ **Don’t use Chlorella.** As an incomplete chelator, with only one thiol group, it can redistribute metals. Also, in nature it tends to absorb metals.
- ◆ **Don’t use Cilantro.** As an incomplete chelator, with only one thiol group, it can redistribute metals. Also, its biochemical mechanism is unknown.
- ◆ **Don’t use Cysteine or N-Acetyl-Cysteine (NAC).** As an incomplete chelator, with only one thiol group, it can redistribute metals.
- ◆ **Don’t use EDTA—yet.** It does increase the amount of mercury excreted in the urine, but it doesn’t chelate mercury from sensitive tissues (brain, liver, thyroid and adrenal glands), and instead moves mercury *into* them. However, after alpha lipoic acid eliminates mercury, EDTA can be used effectively to chelate lead, and to clean out clogged arteries.
- ◆ **Don’t use Glutathione.** As an incomplete chelator, with only one thiol group, it does pull mercury out of tissues but then tends to redistribute it.

Even dithiol group chelators, however, are safe and effective only when used correctly. Another vital component of Cutler's method is the *timing* of when one ingests a chelator. "Half-life" refers to the amount of time it takes for the concentration of a substance to be reduced in the body by one-half. To prevent redistribution of metals into the tissues due to a weakened dose, a fresh supply of chelating agent must be taken at the very moment that it's half as strong as it was when first ingested. To ensure that there's always the highest level of chelator in the system, an exacting schedule must be followed. This means setting an alarm clock and awakening in the middle of the night to take the next dose. Those who are willing to adhere to this rigid schedule will have low—but stable—blood levels of chelators, which means that metals will be moved out of the body consistently and steadily.

Most tests that determine which metals are in the body are inaccurate, so Cutler discouraged them. (Also, mercury can't be detected directly; it hides in body tissues.) Cutler also taught a precise schedule of what to take for which metals (each chelating agent has an affinity for a different set of metals), in what order, how many days one should take a chelator and how many days one should rest, how to increase doses, and what to do if one detoxifies too quickly. Chelation is done in phases. The subject chelates for a certain number of days (usually three or four, occasionally up to fourteen), and rests for a certain number of days (usually three or four). Rest periods are important, as they give the detoxification channels a chance to restore themselves. The subject always begins with very low amounts of chelation agents and gradually increases the doses. However, everyone is different, so let yourself be guided by how you feel.

Chelators Used:

- ◆ **Alpha Lipoic Acid (ALA).** Removes mercury, arsenic, and antimony. Half-life: 3 hours. Water-soluble and fat-soluble, it's able to cross the blood-brain barrier and thus remove metals from the brain. Although ALA can remove mercury by itself, for some people DMSA and DMPS help alleviate some unpleasant symptoms during the removal process. *Wait three months to begin this protocol if you've been exposed to mercury.*
- ◆ **DMSA (Meso-2,3-dimercaptosuccinic acid).** Removes mercury, cadmium, antimony, arsenic, and lead. Half-life: 4 hours. Cannot cross the blood-brain barrier. It's used in conjunction with ALA.
- ◆ **DMPS (2,3-Dimercapto-1-propanesulfonic acid).** Removes mercury and arsenic. Half-life: 8 hours. Cannot cross the blood-brain barrier. It's used in conjunction with ALA.

Before Undergoing Cutler Protocol:

- ◆ *Don't chelate if you still have mercury fillings in the mouth.* Mercury amalgam fillings outgas. Get them removed first, and then wait three months before undergoing a mercury chelation program.
- ◆ *Fix glandular issues.* Many metal-toxic people have stressed thyroid and adrenal glands, which should be balanced (if possible) before chelation.
- ◆ *Don't do "challenge" testing.* "Challenge" tests, conducted to see if a toxic metal is indeed in the body, will make the problem worse.
- ◆ *Don't do intravenous (IV) chelation except for Vitamin C.* Cutler was against IV chelation for two reasons. (1) The half-life of a chelator isn't considered and all of the chelation ingredients are mixed together in one solution and administered together. (2) The doctors and naturopaths who administer the IVs use some ingredients that are incomplete chelators, which can worsen the problem.

While Undergoing Cutler Protocol:

- ◆ *Do not take chelators unless you follow their half-life schedule.* If you chelate improperly, the metals will be pulled out of the tissues without being excreted, which will make you even more ill.
- ◆ *Follow a Paleo diet.* Caffeine, alcohol, sugars, high levels of carbohydrates (grains and flours), fake and junk foods, and even fruit must be avoided. (See "Nutritional Support" in this Insert, page 623.)
- ◆ *Take the following while chelating:* Vitamins and minerals, Coenzyme Q10, liver support (milk thistle), some amino acids, and appropriate herbs.
- ◆ *Don't take ALA as a supplement, but as part of the metal removal protocol.* ALA is a highly effective antioxidant, but it must be used properly.
- ◆ *Don't rush the process.* People can make themselves seriously ill if the body is pushed to excrete more contaminants than it can comfortably process.
- ◆ *Use a sauna.* The effortless release of toxins through the skin helps most people feel better, faster. However, it may not be necessary to do Cutler's protocol if you have regular access to a sauna; see the bottom of this page.

How Long To Do Cutler Protocol:

- ◆ *Ideally, for 6–12 months after relief is obtained.* Some people chelate for several years.

There's one more, very different protocol, which uses sauna therapy, optional exercise, and niacin and other nutritional supplements. Some find it easier. See page 696.

establishment medicine offers is antibiotic drugs. Drugs can help if you take them within three weeks from the date of infection. After that, the spirochete has established a strong presence, has likely changed form, and has likely already produced biofilms. To bypass the bacterial defenses, doctors occasionally have success administering on-and-off doses of different types of antibiotics (which is not how these drugs are normally used). However, pharmaceuticals are very toxic to the liver and other organs, and may not work. They can also negatively interact with other drugs, herbs, and even foods.

Entirely new species of organisms have been discovered that are part of the Lyme disease complex. Worm-like creatures are making their homes inside the biofilms along with the “regulars” (*Borrelia*, *Bartonella* and *Babesia*), and migrate anywhere in the body. The continued existence of these worm-like creatures helps perpetuate the existence of other pathogens. Moreover, it appears that these worm-like pathogens have merged with *Borrelia*—creating a hardy, new hybrid organism. So, killing *Borrelia* alone is no longer sufficient; the worms must be killed too. Physicians may prescribe pharmaceutical or herbal antiparasite agents (or both) to kill the worm-like creatures, and also destroy *Borrelia*, *Bartonella*, and *Babesia*. Some of these anti-worm preparations can degrade biofilm and accentuate the effectiveness of other Lyme treatments. The drug Ivermectin is a possibility. Tinidazole, an anti-parasitic drug widely used in Europe against protozoa infections, is reported to be effective because it doesn’t cause the “Lyme defense mechanism” that so many antibiotics trigger. However, it’s still a strong drug, and understandably most Lyme sufferers cannot tolerate pharmaceuticals.

Someone with Lyme might not experience extreme symptoms if the spirochetes are encased in biofilm. “If your infections and toxicities are left alone without treatment for long enough, the body reaches a sort of homeostasis, or equilibrium, wherein you may feel a lot better than you actually are,” writes Bryan Rosner, author of books on Lyme. “A person who has not yet treated their infective colonies aggressively may only be experiencing symptoms which are the tip of the iceberg. The [bacteria] can become established in a stealthy and quiet fashion, and it is only when you begin to remove them that you realize how bad they really are. This is quite different from most other kinds of health problems, wherein your feeling of how sick you are is pretty closely tied to the reality of how sick you are.”⁹⁵ Once the pathogens are released from their fortress, their presence in the bloodstream can cause inflammation and toxicity; so remain calm.

Healing Lyme requires an individualized, multifaceted, flexible approach. The biggest challenge to healing is knowing what the body needs at the moment—which can change from week to week or even day to day. Sometimes, the focus should be on killing the Lyme. Other times, it’s nutritional support. Still other times, one must focus on detoxification to eliminate the wastes caused by the Lyme

(and the body’s response to it). And still other times, the person may need to focus on correcting the damage to the nerves and brain, endocrine glands, immune cells, digestive tract, or even the muscles, eyes and bones. What works for one may not work for another. And what worked for someone yesterday may not work today. Or, even more frustrating, what worked for someone in the morning may not work for that same person in the evening!

Lyme sufferers must ask themselves: “Which pathogens involved in Lyme and its co-infections are currently the most active? Also, are the immediate main health issues related mostly to pathogens, or to the systemic problems that have escalated as a result of being ill?” Rosner classifies Lyme sufferers into two categories: those whose symptoms are caused primarily by infections, and those whose symptoms are primarily due to other, non-infection issues, such as allergies or hormone imbalances. These distinctions are important—because if the primary issue is pathogens, nutritional supplements and hormone therapies will have minimal impact on overall wellness. Likewise, if the primary issue is allergies due to a leaky gut, or hormone imbalances due to toxins, Rife Therapy and antimicrobials will have minimal impact. Therefore, the challenge to eliminating Lyme is knowing what issue needs to be addressed at the time so the correct protocol can be used. Note, too, that when one pathogen recedes or is eliminated, another may erupt. Thus, it’s important to catalogue any symptoms you’re feeling so you (and your health practitioner) know which pathogen (if any) to focus on eliminating next.

Lyme, its co-infections, and their toxins make it difficult to maintain emotional balance (see Sidebar, “Pathogens Subvert Our Brain Chemistry”). You may experience anxiety, memory loss, depression, aggressiveness, obsessive-compulsive behavior, and even schizophrenia and suicidal tendencies. Many people with Lyme despair, believing that their health will never improve. Despite appearances, though, these psychological displays are not individual character defects, but indicate damage to the sensitive brain and nerve tissue that have been invaded by the drilling spirochetes. “Once people understand that their emotional states are in fact rooted in physical degeneration,” writes Rosner, “it can be much easier to deal with the symptoms and say to oneself, ‘I’m not going to let these feelings dominate me, because I know they...aren’t really who I am.’”⁹⁶

Finding a way to maintain hope is critical to healing. Practitioners recommend that even after apparent success from rifting, continue for six months to one year to make sure all stray pathogens are eliminated. Your protocol also includes any herbs and supplements that have helped you.

Rife Therapy can kill *Borrelia*, but only when the pathogen is in its spirochete form, circulating through the bloodstream. A “Doug device” (named after the inventor) and its offshoot, the “coil” machine, can reach and disable pathogens with frequencies delivered via a magnetic field.

Pathogens Subvert Our Brain Chemistry

Bacteria, viruses, fungi, protozoa, and worms are all parasitic. They “grow, feed, and [are] sheltered on or in a different organism while contributing nothing to the survival of its host.”⁶ Parasities affect their hosts mentally and emotionally as well as physically. Some “directly or indirectly interact with host nervous systems, leading to a change in host behavior. . . . [that often] enhances parasitic transmission . . . Parasites can affect host behaviour by: (1) interfering with the host’s normal immune–neural communication, (2) secreting substances that directly alter neuronal activity via non-genomic mechanisms and (3) inducing genomic- and/or proteomic-based changes in the brain of the host. . . . Parasites typically induce a variety of effects in several parts of the brain. . . [such as] the thalamus, brain stem and basal ganglia.”⁷

Bryan Rosner applies this understanding to the Lyme pathogen specifically, whose toxins sabotage our behavior and attitudes for its own benefit.

As scary as it sounds . . . parasites actually take control of their host’s mind. . . . With Lyme disease, the most common manifestation of this phenomenon seems to be that parasites limit a person’s drive, ambition, and motivation to get well. Somehow, people are convinced that they are not that sick, and that aggressive treatment is not required or desirable. This is one of the reasons why it is so important to be under the care of a good doctor who can prescribe the necessary treatments. Be aware that you may have been pacified by the parasites in your body, and you may need to work diligently to get well despite the feeling that your problem isn’t urgent.⁸

However, emissions from these units are very strong and harm some sensitive people. The Beck magnetic pulser is milder and safer. Another magnetic unit, the hand-held Magnetex[®], which works by pulling debris from the tissues, may be especially helpful. According to one doctor, the Magnetex[®] successfully draws out even dormant pathogens from the spinal fluid. To increase cell voltage, try the Avazzia[™] or the Tennant Biomodulator[®]. Each person responds differently, so experiment to see which unit works best for you. See Appendices A and C for details about these machines.

Except where indicated, the frequencies below do not distinguish between *Borrelia* varieties. Lyme often occurs with othe (see Chapter 3) r similar illnesses carried by the same insects, so also see “*Ehrlichia chaffeensis* / Ehrlichiosis” and “*Rickettsia rickettsii* / Rocky Mountain Spotted Fever”

in this **BACTERIA** section; and **PARASITES, PROTOZOA AND WORMS**, “*Babesia* / Babesiosis.” Also see, under **CHEMICAL SENSITIVITY / POISONING**, “Mercury, Aluminum, and Other Contaminants,” because the pathogens feed on heavy metals. In addition, what is believed to be a new parasite has recently been discovered in people with Lyme, so also see **PARASITES, PROTOZOA AND WORMS**, “*Funis vermis* / *Homo Funis vermis* / Ropeworm.”

Clinicians have found thyroid underactivity in many people with Lyme. Hypothyroidism lowers immune function, making one more susceptible to contracting Lyme; but conversely, the *Borrelia* spirochete and its toxins can impair the gland. See **GLANDS, Thyroid**, “Thyroid, Underactive / Hypothyroidism.” Also see entries under **GLANDS, Adrenals**, as Lyme puts enormous stress on the adrenals, which require extra support. Some people have reported supplementary help using “Blood, to Clean,” under **REGENERATION AND HEALING**.

Dr. Dietrich Klinghardt has reported that all of his electrosensitive clients have Lyme. When exposed to electrosmog, pathogens perceive that they’re being attacked and increase their production of biotoxins. These *Borrelia* poisons eat away at the protective fatty myelin sheath surrounding the nerves, causing the host to become even more electrosensitive. Therefore, also see **REGENERATION AND HEALING, Electrical Sensitivity, to Reduce**, along with applicable frequencies under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

One critical hidden cause of susceptibility to Lyme disease is mold toxins. Even if mold is killed, its toxins remain in 25% of the population. Bryan Rosner reports experiencing success in all of his Lyme protocols once he used ozone to neutralize and eliminate mold toxins (see Chapter 3). Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**.

The following four blocks of frequencies were tested in a Romanian laboratory by colleagues of Jimmie Holman. The manufacturer emphasizes that these frequencies might not work on units other than those manufactured by Pulsed Technologies.

Main program: 34086, 41055, 55055, 55062, 58443, 72912, 74520, 75141, 78864, 86940

For more help, try: 24304, 26288, 34086, 34224, 38115, 41552, 54027, 54096, 54234, 53303, 55055, 56810, 57040, 56925, 58305, 58374, 58443, 58512, 72912, 77715, 78864, 79534, 79695, 79856, 83655

Then try: 24840, 25047, 28980, 29095, 35955, 40894, 41055, 41400, 41745, 50094, 50148, 50163, 50232, 52164, 52371, 52578, 52785, 54924, 54993, 55062, 55131, 58443, 59925, 63756, 64009, 64262, 64515, 65025, 74520, 75141, 75348, 75647, 75946, 76245, 83490, 83895, 83605, 86940, 87630, 87975

And then try: 34086, 41055, 41124, 41193, 41262, 42978, 51888, 51957, 52026, 52095, 57960, 58098, 58167, 58236, 68425, 68540, 68655, 68770, 86250, 86365, 86480, 86595, 86710, 86825, 89845

Works well for some: 10226 for first three months, then 10228 after that, because the pathogen mutates. One practitioner eliminated Lyme with these frequencies.

The following frequencies work when using a Doug Coil machine, but be aware that there's no guarantee they will work when run on other equipment: 432 and 612 (it can take up to 30 minutes before seeing results).

From Dr. John Garvey: 254, 644, 605, 673, 797, 1455

From Dr. Richard Loyd: 587

Also try: 410, 433, 2016

Some rifers have found these helpful (use for 5 minutes each, if you can tolerate that long): 840.6 and 2016

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 378950 (lowest), 380K (optimal), and 382K (highest)

Hz set: 939.32 (lowest), 941.93 (optimal), and 946.88 (highest)

Also from Clark: 18919.09

Borrelia afzelii: 796 (from Dr. Loyd)

Borrelia burgdorferi: 380K

Borrelia garinii: 382K

***Borrelia* Toxins, to Lower and Neutralize Inflammation**

High levels of cytokines, present because of pathogenic toxins, cause inflammation that lead to many different types of symptoms: muscle and nerve aches and pains, brain fog, fatigue, chills, and sweats.

First try: 111103, 446611

Also try: 3, 20, 33, 72, 95, 125, 146, 148, 300, 330, 333, 444, 522, 555, 787, 727, 880, 10K, 1865, 12595

Pathogens that inhabit the Lyme spirochete

From Dr. Jeff Sutherland. Run each for 6 minutes unless otherwise noted: 444444 (1–2 hours), 20070324, 644736, 544444, 333667, 243331, 133332, 73445, 43776, 24566

Branhamella catarrhalis* / *Moraxella catarrhalis

Causes acute infections in the ear, sinuses and respiratory tract, and life-threatening diseases in the heart and brain.

579, 581, 687, 678, 770, 772, 775, 778, 2013

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 394900 (lowest), 396K (optimal), and 396700 (highest)

Hz set: 978.86 (lowest), 981.59 (optimal), and 983.32 (highest)

***Brucella*, all types**

Brucella strains are most known for causing undulant fever in animals and sometimes humans. The government calls it a “potential bioterrorism agent.” One report says that *Brucella suis* “was the first pathogenic organism weaponized by the U.S. military during the 1950s.”¹⁰ *Brucella* may be implicated in Multiple Sclerosis. For more frequencies that are highly accurate, go to dnafrequencies.com.

Brucellosis / Brucelliasis / Undulant Fever

Brucella family pathogens cause Brucelliasis, or undulant fever. Symptoms in cattle, sheep and goats include convulsions, enlarged spleen, overheating, and swelling of joints. Symptoms in humans include fever; headache; weakness; fatigue; constipation; pain in nerves, bones and muscles; sweating; a tender and enlarged spleen; and even depression. See below.

Brucellosis / Brucelliasis / Undulant Fever

Brucella family pathogens cause Brucelliasis, or undulant fever. Symptoms in cattle, sheep and goats include convulsions, enlarged spleen, overheating, and swelling of joints. Symptoms in humans include fever; headache; weakness; fatigue; constipation; pain in nerves, bones and muscles; sweating; a tender and enlarged spleen; and even depression. See entries below and **VIRUSES**, “Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS).”

***Brucella abortus* / Bang's bacillus / Undulant Fever**

This fever, in cattle, causes convulsions, enlarged spleen, overheating, and joint swelling.

From Dr. John Garvey: 1423

***Brucella melitensis* / Undulant Fever, another form**

This fever, in goats and sheep, causes convulsions, enlarged spleen, overheating, and joint swelling.

748 (from Dr. Garvey), 643, 695

Campylobacter

Causes sudden infectious diarrhea in newborns and adults.

From Dr. Richard Loyd: 333 + 523 + 768 + 786, 378, 705.86, 732, 733, 1633, 1834, 2222, 2823.5

If You Have Lyme, Check for Mold Toxins

The more ozone . . . I did . . . the more I realized that “Lyme disease and co-infections” aren’t the primary problem in this chronic illness. . . . Mold is. . . . Lyme disease is just an opportunistic infection which happens to thrive in the presence of mold exposure. . . . This doesn’t make the damage caused by Lyme less important [but] Lyme is only there in the first place because of mold exposure.

—Bryan Rosner,
excerpts, *Lyme and Supercharge*, 2019

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 352K (lowest), 355K (optimal), and 357200 (highest)

Hz set: 872.52 (lowest), 879.96 (optimal), and 885.41 (highest)

Chlamydia pneumoniae

Sometimes called *Chlamydophila*. Major respiratory pathogen, makes one more at risk for heart attacks, strokes, and Alzheimer's. Sometimes implicated in Multiple Sclerosis. If your unit can't do decimals, round up or down to the nearest number and sweep. Run each frequency for 5 minutes.

875 (from Dr. Loyd), 470.9, 471.66, 479, 620, 940.1, 941.8, 942, 942.9, 943.3, 1880.1, 1885.9, 3760.3, 3767.3, 3771.7, 3773.3, 7520.5, 7543.4, 4710.5

Chlamydia trachomatis

Sexually transmitted bacterium that can cause urethritis (inflammation of the urethra or urinary tube), conjunctivitis (inflammation of the eye), and proctitis (inflammation of rectum and anus). It also causes lymphogranuloma venereum (venereal disease, featuring inflammation and ulceration of the lymph glands). If not treated, an infection from this pathogen may cause miscarriage and infertility in women. It can be passed to infants in the birth canal, causing eye infections and pneumonia. This organism may play a developmental role in cancer and Multiple Sclerosis, so see a doctor. Also see "*Chlamydia pneumoniae*," above; and "Lymphogranuloma venereum (LGV)" under **MEN, Penis** or **WOMEN, Vagina, Labia and Clitoris**. Also see **CANCER**, "Uterine Cancer or Tumor," as pelvic inflammatory disease (PID) caused by *Chlamydia trachomatis* has been associated with a greater risk of developing ovarian and cervical cancer.

From Dr. John Garvey: 430, 620, 624, 840, 2213

Also try: 430, 555.7, 866, 1111.4, 2222.8

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 379700 (lowest), 381K (optimal), and 383950 (highest)

Hz set: 941.18 (lowest), 944.40 (optimal), and 951.72 (highest)

Also from Clark: 18968.87

***Chlamydia psittaci* / Parrot Fever / Ornithosis / Psittacosis**

Chlamydia psittaci causes infectious pneumonia that's transmitted, through feces and respiration, by birds in the parrot family and other species. Symptoms include appetite and weight loss, difficulty breathing, depression, tucking in of the head, diarrhea, eye and nose discharge,

and sudden death. Sometimes humans are affected in the respiratory tract.

583, 1217 (both from Dr. Garvey), 233, 331, 332, 859

Citrobacter amalonaticus

An anaerobic bacterium found in the soil, air, water, and the digestive tracts of humans and bats. This pathogen usually isn't addressed in blood and stool tests because it's common and normally doesn't cause problems. However, it can cause severe infections in people with weakened immunity. Most common symptoms include diarrhea, and on rare occasions, urinary tract infections.

From Dr. Richard Loyd: 755

Citrobacter freundii

Found in soil, intestinal tract and food, causes infections of digestive, urinary and respiratory tracts and blood, and can have a high mortality rate (22%).

From Dr. Richard Loyd: 446

***Clostridium botulinum* / Botulism (food poisoning)**

A toxin, commonly from spoiled food, that attacks nerves. Symptoms typically begin between 12 and 36 hours after toxin is ingested. Causes muscle weakness and paralysis starting in the face (with difficulty swallowing), and gastrointestinal distress (nausea, vomiting, cramping).

From Dr. John Garvey: 518

***Clostridium difficile* / Pseudomembranous Colitis**

Clostridium difficile forms spores in the colon, producing a toxin that causes frequent, foul smelling, watery diarrhea. When bloody mucus-filled diarrhea, abdominal cramps, and abnormal heart rhythm appear, the condition is called pseudomembranous colitis. If this pathogen migrates to the brain in children, it causes autism. These conditions usually develop after antibiotics are ingested and the beneficial intestinal flora are overpowered by *Clostridium difficile* and other pathogenic bacteria.

678 (from Dr. Loyd), 387, 635, 673

***Clostridium tetani* / Tetanus / Lockjaw**

Infectious and painful, with continual contraction of some involuntary muscles. Spasms are focused in the jaw, throat, and face. Tetanus is often contracted by being punctured with a rusty nail. The homeopathic remedy *Ledum* is commonly used to treat this condition.

From Royal Rife, possibly used on his #4 machine: 234K

Also try: 554 (Garvey) 120, 244, 352, 363, 458, 465, 600 + 625 + 650, 628, 660 + 690 + 727, 787, 880, 1142

Clostridium paraputrificum

Rare causes of septic arthritis, sepsis, sickle cell anemia.

From Dr. Richard Loyd: 444

***Corynebacterium diphtheriae* / Diphtheria**

Diphtheria, caused by *Corynebacterium diphtheriae*, is rare in the United States. Symptoms of this infection include sore throat, fever, rapid heartbeat, nausea, chills, and headache. This bacterium may also cause heart and nerve damage due to microbial toxins.

151, 340, 432, 590, 624, 776, 788, 925

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 340K (lowest), 342K (optimal), and 344K (highest)

Hz set: 842.78 (lowest), 847.73 (optimal), and 852.69 (highest)

***Corynebacterium minutissimum* / Diphtheria**

Causes blotchy red skin infection, common in heat.

From Dr. Richard Loyd: 488

Corynebacterium striatum

Causes wide range of infections.

455

Cutibacterium acnes

Colonizing the skin, this bacterium not only causes acne (a common skin condition), but has been implicated as the leading cause of infection in prosthetic joints, particularly in the shoulder.

From Dr. Richard Loyd: 368

***E. coli* / *Escherichia coli*, including Rod Form and Mutant Strains**

Often found in colon and infected wounds. If you develop a cold after using these frequencies, see “Adenovirus” entries under viruses. Royal Rife used the older name for this bacterium is “*Bacillus coli*” (“*B. coli*”).

From Royal Rife, possibly used on his #4 machine:

417K (rod form); 770K (filterable virus)

From Dr. Richard Loyd: 468, 667, 745

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 392K (lowest) and 393K (optimal and highest)

Hz set: 971.67 (lowest) and 974.15 (optimal and highest)

Also from Clark: 356K or 882.44 (for units unable to output KHz) and 17724.20, 19566.32

Also try: 468, 667, 745 (three from Dr. Loyd), 282, 289, 327, 332, 333, 358, 413, 539, 548, 552, 642, 787, 798, 799, 800, 802 + 1550, 804, 832, 834 (for 10 minutes) 880, 957, 1320, 1550 to 1552, 1722, 1729, 7847, 7849, 12872

***Ehrlichia chaffeensis* / Ehrlichiosis**

All *Ehrlichia* strains, including *Ehrlichia chaffeensis*, cause human monocytic Ehrlichiosis, transmitted by ticks and other insects. Symptoms can include anemia, fever, headache, nausea, vomiting, muscle pain, respiratory disturbances, and in severe cases meningitis and kidney failure. Frequencies for *Ehrlichia ewingii* and *Ehrlichia phagocytophila* are available at dna-frequencies.com.

Ehrlichiosis is often present with other pathogens carried by the same insects, so also see “*Rickettsia rickettsii* / Rocky Mountain Spotted Fever” and “*Borrelia*, all types / Borreliosis / Lyme Disease” in this section; and **PARASITES, PROTOZOA AND WORMS**, “*Babesia* / Babesiosis.”

300, 336.4, 382.2, 394.7, 528.4, 672.7, 749.2, 764.4, 918, 1200, 1317.2, 1345.4, 1369.8, 1364.9, 14980.5, 1836

Also try (from Dr. Richard Loyd): 0.08, 0.12, 0.85, 58.87, 224.03, 410.2, 585.83, 626.07, 725.34, 826.9

***Ehrlichia equi* / Ehrlichiosis**

Human granulocytic Ehrlichiosis, caused by *Ehrlichia equi*, is spread by the bite of a deer tick or common dog tick. Some of the following frequencies are experimental.

1.2 + 250, 295, 354.2, 349, 406, 469.7, 590, 637.9, 698, 7080.5, 939.3, 1180, 1223.4, 1416.9, 1878.7, 2833.9, 3248.3, 3757.3

Eikenella corrodens

Bacterium causes dental infections, often found with *Strep*. Also lives in intestinal, genital, and respiratory tracts.

From Dr. Richard Loyd: 834

Enterococcus faecalis

An aerobic bacterium common to the gastrointestinal tract, *Enterococcus faecalis* can cause life-threatening infections in humans and mammals. It's prevalent in hospitals, where it has developed an immunity to antibiotics. This pathogen is also found in a high number of tooth-related infections (including root canals), and in the urinary tract and prostate gland. It's also responsible for infections in wounds and on the skin, where it's called cellulitis. Frequencies are from Dr. Richard Loyd.

756, 757, 758, 759, 760, 761 (you can sweep all of these, as long as you allocate enough time for the session), 834

Enterococcus faecium

A relative of *Enterococcus faecalis*, *Enterococcus faecium* causes meningitis and endocarditis.

343, 686

**You may not need every frequency in an entry.
To determine which ones you need,
try muscle testing or dowsing (see Chapter 4).**

***Francisella tularensis* / Tularemia / Rabbit Fever / Deer Fly Fever**

Francisella tularensis affects and is carried worldwide by not only cottontail rabbits, but over a hundred other species of wild animals, birds, and insects: mice, squirrels, groundhogs, beavers, coyotes, muskrats, possums, sheep, game birds, ticks, lice, deerflies, and mosquitoes.

Symptoms in a rabbit include a swollen spleen, white spotted liver, and ulcerations. Humans contract tularemia from the bite of an infected insect; when broken skin touches an infected cottontail rabbit or contaminated pelt; by drinking contaminated water; or by inhaling dust from contaminated soil. Symptoms include ulcers, inflamed and swollen lymph glands, fever, headache, sudden chills, weight loss, abdominal pains, vomiting, fatigue, and headaches. A fatal form of pneumonia can develop.

Reduce infection risk by carefully cleaning, handling (with rubber gloves), and thoroughly cooking rabbit meat.

First try: 324, 427, 823

Also try: 323, 694, 913

***Fusobacterium*, all types**

Cause periodontal diseases, skin ulcers, swelling of jugular vein due to clots (thrombophlebitis), and throat infections.

From Richard Loyd: 377, 948, 953

Gardnerella

Bacteria that often infect and inflame the vaginal mucosa. 782 (from Dr. John Garvey), 320, 329, 485, 695, 995

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 333K (lowest), 340K (optimal), and 342550 (highest)

Hz set: 825.42 (lowest), 842.78 (optimal), and 849.10 (highest)

Also from Clark: 16927.60

Gordona sputi

Can cause lung infections.

381.2, 400.6, 429.1, 435.4, 762.3, 801.2, 858.2, 870.7, 3432.8, 1524.7, 1602.3, 1716.4, 17410.5, 3049, 3204.6, 3483

***Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer**

An ulcer is a sore, often filled with pus (decayed white blood cells). Most people who say “ulcer” mean the sore in the mucous membrane stomach lining or the duodenum (upper part of the small intestine that connects to the stomach). *Helicobacter pylori* can cause stomach cancer and can be present in glaucoma and arthritis. It’s transmitted to and from people, dogs, cats, sheep, gerbils, and pigs.

Adjunctive therapies include colloidal silver, oregano essential oil, the probiotic *Lactobacillus salivarius*, and New

Zealand Manuka (tea tree) honey. The honey should be labeled *UMF 15+* for “Unique Manuka Factor,” which designates its antibacterial strength. Mastic gum tincture from the *Pistacia lentiscus* tree works very well. Suppressed emotions such as anger inhibit gastric juice secretion which allows pathogens to grow, so consider psychotherapy.

Also see different frequencies for the same pathogen under **GASTROINTESTINAL TRACT, *Stomach and Esophagus*.**

Adapted (times only, rounded up) from Jimmie Holman. These numbers are combined with those for *Campylobacter*.

For 5 minutes: 400K, 36463.38, 36244.38

For 3 minutes: 36909.42, 56486.95, 36081.85, 31985.99, 36629.38, 35359.51, 36135.87

For 2 minutes: 36518.550, 36573.88, 36853.07, 51432.02, 31031.12, 31430.68, 32328.69, 35761.13, 36190.04, 36965.94

***Klebsiella pneumoniae* / Pneumonia**

Klebsiella pneumoniae causes severe pneumonia, where infected and inflamed lungs fill with copious amounts of fluid and mucus. Symptoms include high fever, chills, and cough. In case there are other pathogens involved in the infection, also see “*Mycoplasma pneumoniae* / Pneumonia” in this section; **PARASITES, PROTOZOA AND WORMS**, “*Pneumocystis carinii*”; and **RESPIRATORY TRACT, *Lungs***, “Pneumonia / Bronchial Pneumonia.”

From Dr. Richard Loyd: 130, 410, 446, 650, 970, 7500, 10470, 152500, 493500, 375690, 475540, 398450, 401000, 404650, 419000

Also try: 412, 413, 746, 765, 766, 779, 783, 818, 840, 2838.5

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

393450 (lowest), 401K (optimal), and 404660 (highest)
416900 (lowest), 419K (optimal), and 421900 (highest)

Hz sets:

975.27 (lowest), 993.98 (optimal), and 1003.05 (highest)
1033.39 (lowest), 1038.6 (optimal), and 1045.79 (highest)

Also from Clark: 19964.61, 20860.78

***Legionella pneumophila* / Legionellosis / Legionnaire's Disease / Pontiac Fever**

Legionella pneumophila is involved with the relatively mild Pontiac fever and the more serious Legionnaire's disease. Legionnaire's got its name in 1976 when a pneumonia-like outbreak occurred among attendees of an American Legion convention in Philadelphia, Pennsylvania, US. The

bacterium had been recognized and named before, but to honor the occasion it was renamed *Legionella*.

Symptoms of Legionnaire's, usually appearing two days to two weeks after exposure, include fever, chills, dry cough, and sometimes muscle and head aches. A more advanced infection may spread to the gastrointestinal tract (abdominal pain, diarrhea and nausea), to the central nervous system (disorientation and confusion), to the kidneys and liver (organ damage), or to the respiratory tract (severe pneumonia that does not easily respond to antibiotics). Legionnaire's disease can sometimes cause death. Pontiac fever causes flu-like symptoms—fever, head and muscle aches usually lasting for two to five days—but pneumonia does not develop and infection doesn't spread beyond the lungs. Symptoms disappear without treatment and without causing further problems.

Legionella is often found in water: hot tubs, whirlpools, hot water tanks. Bacteria are not spread by person-to-person skin contact, but from contaminated vapor or mist that's inhaled. The elderly, smokers, people with chronic lung disease, weak immunity, cancer, diabetes or kidney failure, are especially susceptible to *Legionella* bacteria.

723 (from Dr. John Garvey), 660 + 690 + 727, 693, 724, 897, 975, 8120, 8856

***Leptospira* / Leptospirosis**

The spirochete bacteria *Leptospira* causes Leptospirosis, an inflammation that spreads to humans through water, food, or urine contact from an infected animal or other human. Symptoms include fever, headaches, rashes, chills, sore muscles, abdominal pain, vomiting, diarrhea, jaundice, and red eyes. If not treated, it can lead to kidney and liver damage, meningitis, anemia, miscarriage, and even death. The bacterium lives in a temperate or tropical climate.

612 (from Dr. John Garvey), 663. Also do a sweep for at least 25 minutes from 600–680

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 397050 (lowest), 399K (optimal), and 401100 (highest)

Hz set: 984.19 (lowest), 989.02 (optimal), and 994.23 (highest)

Also from Clark: 19865.04

***Listeria monocytogenes* / Listeriosis**

Listeriosis is a serious illness sometimes called the “circling disease” because the affected ruminants (animals with more than one stomach, such as cows) are often seen walking in circles. Pigs, cows, sheep, goats, hens, dogs, cats, and rodents are also affected. The disease can spread to humans through animal urine and improper handling of food.

Symptoms include nervous system disorders, fever, and loss of appetite. Sometimes there is liver degeneration, fever, fatigue, nausea, vomiting, diarrhea, inflammation

Conventional medicine does not test for cell-wall-deficient bacteria during the process of diagnosing diseases. Hence, there is a wide range of symptom[s] . . . which end up being diagnosed with nonsense disease labels such as “fibromyalgia,” “chronic fatigue syndrome,” or “depression.” These disease labels . . . are flawed because they provide only a description of symptoms but absolutely no useful information about the *cause* of the problem. Such diseases are known in the conventional medical community as “idiopathic.” The word means “without known cause,” but is really just a fancy way to say “We have no idea what is wrong with you.” Diagnosing muscle pains with the label “fibromyalgia” is like diagnosing a broken transmission in your car with the label “It Just Don't Work No More.”

—Bryan Rosner

The Top 10 Lyme Disease Treatments, 2007

of the brain and heart, and miscarriage. Other, more subtle symptoms include uncoordinated movements and progressive paralysis. Death among animals can occur within two weeks. Humans catch the disease by eating affected animals. It's easy to control this disease. *Listeria monocytogenes* lives aerobically, not only in soil whose pH is higher than 5.4, but also in fermenting animal feed. If the animal raisers feed their livestock unspoiled food—or allow them to graze—the animals are unlikely to contract the disease. Healthy animals are resistant to infection. Also see the various “*Streptococcus*” entries in this section. 471, 744, 2162 (first three from Dr. John Garvey), 377, 626, 628, 634, 714, 724, 852 (from Dr. Loyd), 7867

Lyme

See “*Borrelia*, all types / Borreliosis / Lyme Disease” in this section.

MARCoNS / Multiple Antibiotic Resistant Coagulase Negative *Staphylococci*

Often found deep within the nasal cavity, especially in people sensitive to mold and in those with environmental illness. It produces a cascade of biochemical malfunctions, which can result in debilitating fatigue, high levels of inflammation, digestive disturbances, and poor sleep.

From Dr. Richard Loyd: 1232 (for 30 minutes). For best result, sweep 1 Hz on either side of the main signal.

Micrococcus tetragenus

Often involved in infections of the seminal vesicles, the sacs that store semen before it's emitted through the penis. 393, 2712 (both from Dr. John Garvey), 433

MRSA

See under *Staph* entries in this section.

Mycobacterium abscessus

Often found in hospital settings. Infects skin.
588

***Mycobacterium avium* / Bird Tuberculosis**

See "*Mycobacterium avium* / Tuberculosis, Aviare / Bird Tuberculosis" under **TUBERCULOSIS**.

***Mycobacterium leprae* / Leprosy / Hansen's disease**

Chronic infectious disease resembling tuberculosis, causing lesions on the skin (especially of the hands and feet), in the mucous membranes of the eyes and nose, and in the nerves not in the brain or spinal cord. The bacteria can enter the body through the nose and possibly through broken skin, especially after prolonged close contact. Children may be more susceptible than adults.

This disease is prevalent in Africa, Latin America, parts of Asia, and Pacific Ocean islands. In 1995, the World Health Organization estimated that two to three million people were permanently disabled from leprosy. Some countries still have leper colonies due to the stigma of having this disfiguring disease.

Allopathic medicine advises taking drugs for up to two years. Herbs and colloidal silver will build immunity.

20, 428, 440, 444 + 1865, 450, 464, 500, 600 + 625 + 650, 660 + 690 + 727, 700, 760, 776, 787, 802 + 1550, 832, 880, 1500, 1600

Mycobacterium intracellulare

From Dr. Richard Loyd: 978

***Mycobacterium avium* subspecies paratuberculosis**

Primarily affects cattle and sheep, but humans sometimes are infected as well.

From Dr. Richard Loyd: 686

***Mycoplasma*, many types**

About one-tenth the size of regular bacteria, *Mycoplasma* affect humans, animals, and plants. Normally not causing serious damage, over half of the 200 species of *Mycoplasma* are now proven pathogens. Also, recent strains of highly destructive *Mycoplasma* have been found with unusual gene sequences that could only result from genetic engineering. On September 7, 1993, Patent number 5,242,820 for a *Mycoplasma* creation was awarded to Shyh-Ching Lo (named as the inventor). The party to whom the invention was transferred was the American Registry of Pathology, affiliated with the US military. A phrase used in conjunction with this pathogen is "biological warfare."

Engineered *Mycoplasma* can survive for only two hours outside the body, but they can live anywhere in the body, stealing nutrients from the host. They invade organs, blood, spinal fluid, bone marrow, urine, lungs, nose, mouth, and nerves. They even cross the blood/brain barrier, and are known to infect developing fetuses.

Slow growing, they can remain in the system for years and even decades, until a trauma—whether from chemicals, emotional upheaval, injury, drugs or vaccines, or illness—activates them. The illness caused by this pathogen depends on where in the body it gravitates, which may be the tissues in the body that are the weakest.

Mycoplasma can bind with any cell type and interfere with the synthesis of proteins, RNA, and DNA. The resulting cellular abnormalities can result in cancer. The ability of *Mycoplasma* to invade the body's lymphocytes, bind to them, and reduce their numbers, weakens immunity so the host is susceptible to other infections as well. When a *Mycoplasma* emerges from a cell, it takes a piece of the host cell membrane with it. Later, the immune system attacking the *Mycoplasma* cannot differentiate the pathogen from the body's own cells and attacks the host cells too. This is the basis of autoimmune conditions, such as rheumatoid arthritis, Crohn's disease, fibromyalgia, thyroid and adrenal dysfunction, lupus, Multiple Sclerosis, and Amyotrophic Lateral Sclerosis (ALS). Other conditions indicating *Mycoplasma* involvement include Gulf War Syndrome or Illness, Chronic Fatigue Syndrome (CFS), chemical sensitivity, HIV / AIDS, and a host of neurological diseases such as Alzheimer's and Parkinson's.

Mycoplasma pneumoniae used to be the most well-known strain, but *Mycoplasma fermentans incognitus* is now known among researchers, war veterans, and laypeople who are aware of its creation as a biological warfare weapon. Evidence suggests that *Mycoplasma fermentans*, which is neither a bacterium nor a virus, has been created by combining the nucleus of the *Brucella* bacterium with a visna virus, and then extracting the *Mycoplasma*.

Researchers use a soy-based broth to grow *Mycoplasma* cultures—soy is a favorite food of these highly dangerous and resistant microbes—giving us yet one more reason to avoid eating soy. Some allopathic physicians prescribe rotating doses of broad-spectrum antibiotics, but this may further compromise immunity. Many people successfully treat *Mycoplasma* infections by drinking large amounts of colloidal silver. See Chapter 3, **Colloidal Silver**.

All strains of *Mycoplasma* produce similar symptoms. Try all the frequencies below if you think you're infected.

From Dr. Richard Loyd: 75.1, 150.3, 254, 300.5, 322.85, 323.50, 323.90, 342.75, 346.00, 349.30, 484, 601, 610, 644, 660, 664, 673.9, 679.2, 684.1, 686.6, 688, 690, 690.7, 706.7, 709.2, 777, 779.9, 783.6, 790, 800.4, 801.88, 829.3, 857.65, 864, 865, 878.2, 880.2, 923.01, 969.9, 975, 986, 1045, 1062, 1067, 1113, 1147, 2404.2, 2688, 2838.5, 2842, 2900, 2950, 7344, 16106.12, 17226.33

From Dr. Marty Monahan: 199, 205, 377, 398, 455, 543, 581, 624, 629, 630, 752, 843

Also try, running for at least 3 minutes each: 388.6, 543.6, 709.2, 777.2, 1087.2, 1554.5, 2174.3, 2838.5, 3109, 4348.6, 6217.9

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

322850 (lowest), 323500 (optimal), and 323900 (highest)
342750 (lowest), 346K (optimal), and 349300 (highest)

Hz sets:

800.27 (lowest), 801.88 (optimal), and 802.87 (highest)
849.59 (lowest), 857.65 (optimal), and 865.83 (highest)

Also from Clark: 16106.12, 17226.33

Mycoplasma buccale

Found in diseases of the mouth (especially of the gingival crevices) and respiratory tract. Experiment with known frequencies for other strains.

Mycoplasma faucium

Found in the mouth (especially the crevices of the gums) and in the respiratory tract. Experiment with known frequencies for other strains.

***Mycoplasma fermentans* /**

Mycoplasma fermentans incognitus

This pathogen fuses with lymphocytes (immune cells) and impedes their immune function, inducing production of inflammatory substances in the body. *Mycoplasma fermentans (incognitus strain)* may be neither a bacterium nor a virus. There's solid evidence that it came from the nucleus of the *Brucella* bacterium and that it was combined with a visna virus. Artificially created pathogens are hard to classify, but *Mycoplasma fermentans* is commonly referred to as a bacterium.

Found in high amounts in the blood of people with other illnesses, including rheumatoid arthritis, Chronic Fatigue Syndrome, Gulf War Syndrome, fibromyalgia, Lupus, HIV / AIDS, autoimmune diseases such as diabetes, Amyotrophic Lateral Sclerosis (ALS), psoriasis and scleroderma, Irritable Bowel Syndrome, cancer, endocrine disorders, Multiple Sclerosis, and urogenital infections and diseases. Also see **GULF WAR SYNDROME / GULF WAR ILLNESS**; other "*Mycoplasma*" entries in this **BACTERIA** section; **VIRUSES**, "HIV (Human Immunodeficiency Virus) / AIDS (Acquired Immune Deficiency Syndrome)"; and **VIRUSES**, "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)."

254, 484, 610, 644, 660 + 690 + 727, 706.7, 790, 864, 878.2, 880.2, 986, 2900

Sweep: 5044–5061; 5355–5458

Always use 40K to help restore cellular vitality.

Mycoplasma genitalium

Causes urogenital infections, pelvic inflammatory disease, nongonococcal urethritis, and perhaps arthritis, infertility and HIV. Experiment with frequencies for other strains or go to dna frequencies.com.

Mycoplasma hominis

Involved in many reproductive disorders (infertility, problem pregnancies, PID (Pelvic Inflammatory Disease), nongonococcal urethritis, vaginitis, pyelonephritis), and issues afflicting newborns: neonatal pneumonia, premature rupture of placenta membranes, infections from Caesarian surgeries, conjunctivitis, and low birth weight. May also be a cofactor in HIV. A study has linked a *Mycoplasma hominis*-like microbe to *Chlamydia pneumoniae*, so also see "*Chlamydia pneumoniae*" in this section.

From Dr. Richard Loyd: 876

Mycoplasma hyorhinis

Often in the respiratory tract of pigs but not humans.

From Dr. Richard Loyd: 689

Mycoplasma lipophilum

Implicated in diseases of the mouth, in particular diseases of the gingival crevices, and respiratory tract. Experiment with frequencies for other strains.

Mycoplasma penetrans

Thought to be a cofactor in HIV, urogenital infections, and autoimmune disorders. Experiment with frequencies for other strains.

Mycoplasma pirum

May be a cofactor in HIV and urogenital infections. Experiment with frequencies for other strains.

***Mycoplasma pneumoniae* / Pneumonia**

Mycoplasma pneumonia causes severe pneumonia (infection and inflammation of the lungs), usually caught and spread by children and young adults. Symptoms include copious fluid and mucus in the lungs, high fever, chills, cough, nasal congestion, sore throat, tracheobronchitis, pharyngitis, and sometimes blood in the mucus of the lungs. This condition also causes problems with joints, the central nervous system and liver, and the respiratory, autoimmune and cardiovascular systems. Some of the issues include asthma, heart disease, leukemia, polyarthritis, urinary tract infections, Irritable Bowel Syndrome, encephalitis, and meningitis. Also see "*Klebsiella pneumoniae* / Pneumonia" in this section; **PARASITES, PROTOZOA AND WORMS**, "*Pneumocystis carinii*"; and **RESPIRATORY TRACT**,

Lungs, “Pneumonia / Bronchial Pneumonia.”

First try: 688 (from Dr. John Garvey), 660 + 690 + 727, 688, 709.2, 777, 975, 2688, 2838.5, 6600
 Then try: 20, 412, 450, 452, 550, 578, 600 + 625 + 650, 683, 766, 776, 787, 802 + 1550, 880, 1238, 1474, 1862

Mycoplasma salivarium

Implicated in arthritis, TMJ (temporomandibular joint) disorders, eye and ear disorders and infections, and mouth and gum infections, including gingivitis, periodontal diseases, and even cavities.

253, 279, 420, 453, 761, 832 (run each for 18 minutes after building up time tolerance)

Neisseria gonorrhoeae / Gonococcus / Gonorrhea

Neisseria gonorrhoeae causes (sexually transmitted) gonorrhea. Symptoms include inflammation of the genital mucous membrane, and painful urination. There may be inflammation in the joints and in the mucosa of the rectum, eyes and mouth. Infection can exist on a sub-clinical level. Men usually experience burning during urination with perhaps a drip or discharge from the penis, but many women do not feel symptoms. This pathogen is resistant to pharmaceutical antibiotics. An untreated infection can migrate to other areas and cause arthritis, prostatitis, cystitis, epididymitis, orchitis, pelvic inflammatory disease (PID), and endocarditis. Also see additional entries under **MEN** and **WOMEN**.

600 + 625 + 650, 660 + 690 + 727, 712

From Royal Rife, possibly used on his #4 machine: 233K
 From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 333850 (lowest), 334K (optimal), and 336500 (highest)

Hz set: 827.53 (lowest), 827.90 (optimal), and 834.10 (highest)

Also from Clark: 16628.88, 927.90

Nocardia asteroides / Nocardiosis

Nocardia asteroides is transmitted mainly through soil, causing nocardiosis. Symptoms include abscesses in the lungs, fever and cough that can last several months, and possibly heart damage and lesions in the brain leading to meningitis (inflammation of the meninges, or protective membranes covering the brain and spinal cord).

228, 231, 237, 694, 710, 887, 2890

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 354950 (lowest), 355100 (optimal), and 355350 (highest)

Hz set: 879.83 (lowest), 880.20 (optimal), and 880.82 (highest)

Also from Clark: 17679.39

Pneumococcus

See “*Streptococcus pneumoniae*” in this section.

Porphyromonas gingivalis

Causes peritonitis (inflammation of the membrane that lines the abdominal cavity) and severe oral infections.

From Dr. Richard Loyd: 867

Prevotella

Commonly found in the teeth, gums and lungs, they disrupt the intestinal flora and are linked to chronic inflammatory conditions. Frequencies below are for four different strains.

From Dr. Richard Loyd: 478, 765, 836, 966

Propionibacterium acnes

Lives in the skin's sebaceous glands (glands that secrete sebum, or oil) and can cause acne. Also implicated in corneal ulcers, endocarditis, and infections after the implantation of heart valves and shunts (tubes connecting various body parts that aren't normally connected to each other). May be a secondary cause of some prostate cancers. Sweep from 5996.1–6078.1 for 20 minutes. Also run 6046.9 separately for 6 minutes.

From Dr. Hulda Clark: 19267.60, 959.28

Proteus vulgaris

Found in soil, water, sewage and the large intestine, this bacterium survives aerobically and anaerobically. It can also degrade urea into ammonia. It often infects the urinary tract, sometimes causing gastrointestinal, ear, sinus and skin infections, with high fever, chills, and abscesses.

634 (from Dr. Richard Loyd), 424, 434, 594 (from Dr. John Garvey), 600 + 625 + 650, 776, 834

Also sweep 749–755

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

408750 (lowest), 413K (optimal), and 416450 (highest)

333750 (lowest), 336K (optimal), and 339150 (highest)

327200 (lowest), 328K (optimal), and 329500 (highest)

Hz sets:

1013.19 (lowest), 1023.72 (optimal), and 1032.28 (highest)

827.28 (lowest) and 840.67 (optimal and highest)

811.05 (lowest) and 816.75 (optimal and highest)

Also from Clark: 20562.06, 16728.45, 16330.16, 832.86, 813.03

Proteus mirabilis

Abundant in soil and water, this microorganism most commonly infects the urinary tract, especially in people who have catheters. This strain is estimated to cause 90% of all *Proteus* infections in humans.

Sweep 764–771

Pseudomonas aeruginosa

Causes infections, including in the urinary tract, ears, lungs, and on the skin of people with burns and wounds. 985 (from Dr. Loyd), 5311, 482 (both from Dr. Garvey), 174, 178, 191, 405, 633, 731, 785, 1132, 3965, 6646

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 331250 (lowest), 333K (optimal), and 334600 (highest)

Hz set: 821.09 (lowest), 825.42 (optimal), and 829.39 (highest)

Also from Clark: 16579.09

***Pseudomonas mallei* / Glanders / Farcy**

Pseudomonas mallei causes Glanders, primarily involving the mucous membranes of the mouth and respiratory tract. It occasionally migrates to the lymph nodes (where it's called Farcy). It mostly affects horses, mules and donkeys, but occasionally it's transmitted to humans, goats, sheep, cats, and dogs. Uncommon in the US and Europe, it appears in Asia, Africa, and South America.

First try: 501, 660 + 690 + 727, 687, 743, 774, 857, 875, 1273

Also try: 20, 787, 880

Pseudomonas pyocyanea

Commonly found in wounds, burns, and urinary tract.

From Dr. John Garvey: 437

Rhodococcus equi

Originating in horses and found in people with severely compromised immune function.

124, 337, 432, 682, 720, 764, 835

***Rickettsia* / Q Fever**

Rickettsia family microbes cause infectious Q Fever. Symptoms include headache, fever, dry cough, muscle aches, chills, sweating, nausea, vomiting, and liver inflammation. Induced by drinking infected milk, or contact with sheep, cattle, goats, cats, dogs, birds, rodents, and ticks and other insects harboring *Rickettsia* and *Coxiella burnetii*. Also see "*Rickettsia rickettsii* / Rocky Mountain Spotted Fever" in this section.

129, 521.2, 523, 549, 607, 632, 720, 726, 943, 1062, 1357, 2084.8

***Rickettsia conorii* / Mediterranean Spotted Fever**

Another name is Boutonneuse fever, also found in Africa, Asia and India. Transmitted by ticks, symptoms include fever, abdominal and chest pain, muscle and joint aches, and a red rash on the legs, especially below the knees.

From Dr. Richard Loyd: 866

***Rickettsia rickettsii* / Rocky Mountain Spotted Fever**

Rickettsia rickettsii causes Rocky Mountain Spotted Fever, an infectious illness carried by wood or deer ticks and other insects. Symptoms include fever, severe headache, gastrointestinal tract, pain in bones and muscles, and later on seizures, jaundice, and heart disturbances.

Rocky Mountain Spotted Fever often occurs with other diseases carried by the same insects, so also see "*Ehrlichia chaffeensis* / Ehrlichiosis" and "*Borrelia*, all types / Borreliosis / Lyme Disease" in this section; and **PARASITES, PROTOZOA AND WORMS**, "*Babesia*/Babesiosis."

First try: 129, 943 (both from Dr. John Garvey), 76, 308, 375, 468, 521.2, 570, 788, 862, 1583, 1584, 2084.8

Then try: 129, 549, 632, 720, 726, 1062

From Michael Tigchelaar: 128, 239, 417, 422, 577, 578, 579, 673, 693, 758, 797, 846, 884, 1455, 1590, 4870, 4880, 5054.9, 4996.9, 7989

***Salmonella* / Food Poisoning**

Of the different *Salmonella* bacteria, two prominent strains that cause food poisoning (also called "Salmonella") are *Salmonella enteritidis* and *Salmonella typhimurium*, both subspecies of *Salmonella enterica*. Often transmitted to humans from animals, symptoms include dehydration, fever, abdominal pain, constipation, diarrhea, nausea, vomiting, and a rose-colored skin rash. Also see "*Bacillus botulinum* / Botulism" in this section.

First try: 1522 (from Dr. John Garvey), 59, 92, 165, 420, 643, 664, 707, 711, 717, 719, 752, 972, 1244, 6787, 7771

Then try: 546, 693, 754, 762, 773, 1634, 8656

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 382300 (lowest), 385K and 386K (optimal), 386550 (highest)

Hz set: 947.63 (lowest), 954.32 and 956.80 (optimal), and 958.16 (highest)

Whether using the KHz or Hz set, use all the frequencies because this microorganism frequently morphs.

Also from Clark: 19168.02, 19217.81

Salmonella enterica

Causes mild stomach distress to severe systemic infection.

760

From Dr. Hulda Clark: 329K or 815.51 (for units unable to output KHz) and 16379.95

***Salmonella paratyphi* / *paratyphi A* / Paratyphoid Fever**

Salmonella paratyphi causes paratyphoid fever. Symptoms include high fever, headache, loss of appetite, vomiting, abdominal cramping, and constipation or diarrhea.

776

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 365050 (lowest), 368K (optimal), and 370100 (highest)

Hz set: 904.87 (lowest), 912.18 (optimal), and 917.39 (highest)

Also from Clark: 18321.64

Salmonella paratyphi B* / *Salmonella B

In humans, contracted through contact with aquariums. Symptoms include fever, vomiting, and diarrhea. The numbers below are from Dr. John Garvey.

59, 92, 546, 643, 707, 717, 972, 1634, 7771

Salmonella typhimurium

A subset strain of *Salmonella enterica*. It can be transferred to humans from raw or undercooked meat and eggs, causing diarrhea, vomiting, abdominal cramps, and fever.

From Dr. Richard Loyd: 180, 570, 1850, 7500, 329K, 382300, 386550, 355K, 386K, 390K

Salmonella typhi* / Typhoid Fever / *Bacillus typhosis

Highly infectious and sometimes life-threatening, Typhoid Fever or *Salmonella* (also the name of the microbe) is transmitted through sewage or contaminated food, to and by humans. The bacterium penetrates the intestinal lining, multiplies, and spreads through the bloodstream, often entering the liver, bone marrow, and bile ducts. Symptoms include high fever, headache, chills and sweats, abdominal bloating, diarrhea, constipation, skin lesions, dry cough, weakness, and sometimes delirium.

Typhoid affects about 21.5 million people yearly, mostly in parts of Asia, Africa, and Central and South America that still have undeveloped hygiene and sanitation. Some people recover but carry the bacteria. When traveling to high-risk countries, drink only bottled or boiled water, avoid raw foods, and wash hands before eating.

Also see "*Vibrio cholerae* / Cholera" and "*Salmonella paratyphi* / *paratyphi A* / Paratyphoid Fever" in this section; "*Entamoeba histolytica* / Amoebic Dysentery" under **PARASITES, PROTOZOA AND WORMS**; and **LIVER AND GALLBLADDER**, *Liver*, "Hepatitis A."

From Royal Rife, possibly used on his #4 machine: 760K (rod form); 1445K (filter passing form)

Also try: 660 + 690 + 727, 712, 714, 802 + 1550, 804, 824, 1770, 1800, 1862, 1865, 3205

Shigella

The name of the microbe and the disease it causes. Usually transmitted through contaminated food, it infects the gastrointestinal tract. Symptoms include nausea, vomiting, diarrhea, fever, abdominal pain, headache, dehydration, and blood, pus, or mucus in the stool. Also see **PARASITES, PROTOZOA AND WORMS**, "Amoebas."

26, 621, 762, 769, 770, 802 + 1550, 832

From Dr. Hulda Clark: 390089 or 966.93 (for units unable to output KHz) and 19421.39

Shigella flexneri

Accounts for one-third of *Shigella* infections in the US. It's linked to depression and can lead to chronic reactive arthritis, causing joint pain, painful urination, and irritation in eyes.

From Dr. Hulda Clark: 394K or 976.63 (for units unable to output KHz) and 19616.10

Staphylococcus* / *Staph

There are many types of *Staph*, a common bacterium that forms in clusters. On the skin it's harmless, but it causes infection if it enters the body via an open cut. Infections can lodge in the skin, eyes, mouth, heart and circulatory system, gastrointestinal tract, and respiratory tract.

Staph general* / *Staphylococcus saprophyticus

According to Dr. Richard Loyd, the most common variety of this bacterium, which people simply call "*Staph*," is *Staphylococcus saprophyticus*. The most important frequencies for *Staph* in general may be 728 Hz and 786 Hz. However, people also find the frequencies below helpful. For the numbers that are close together, set your machine to do a sweep. 647, 727, 728, 745, 786, 786, 875, 876.5, 877, 878, 879, 880, 881, 882, 883, 884, 885

Staphylococcus albus

Commonly present on the skin, and involved in many wounds and skin infections.

From Royal Rife, possibly used on his #4 machine: 478K

Staphylococcus aureus methicillin-resistant MRSA

Antibiotics to which this *Staph* strain is resistant include methicillin, penicillin, amoxicillin, and oxacillin. Infections occur mostly in hospitals and other facilities where subjects have weakened immunity. Manuka honey (ingested and externally applied) can eliminate these infections.

From Richard Loyd (in this order): 8697, 7270, 1050, 999, 943, 824.4, 787, 784, 745, 738, 728, 727, 647, 644, 555, 478, 466, 424, 5906.25 (for 30 minutes)

Staphylococcus (pyogenes) aureus

Found on the skin in infected cuts and pimples, and in the nose and throat. It causes nausea, vomiting, diarrhea, boils, abscesses, tooth infection, and heart disease including endocarditis. It can also contaminate existing tumors.

From Dr. John Garvey: 727, 943

Dr. Richard Loyd, noting that the pathogen keeps mutating, updated his protocol on February 12, 2021: 366, 456, 466, 467, 468, 478, 555, 576, 644, 647, 668, 687, 727, 728, 737, 738, 745, 757, 764, 767, 784, 785, 786, 786.5, 787, 788, 824.4, 878, 936.97, 943, 944.4, 946, 999, 1050, 2352.44, 2371.11, 5906.25, 5953.12, 7270, 8697

From Dr. James Bare: sweep 723–730

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 376270 (lowest), 378K (optimal), and 380850 (highest)

Hz set: 932.68 (lowest), 936.97 (optimal), and 944.03 (highest)

Also from Clark: 18819.51, 18968.87 and 381K, or 944.40 (for units unable to output KHz)

Staphylococcus auricularis

Often involved in ear infections.

From Dr. Richard Loyd: 366

Staphylococcus capitis

Can cause blood infections and endocarditis.

From Dr. Richard Loyd: 866

Staphylococcus caprae

On healthy human skin, nails, and nasal mucosa. In excess, infects primarily bones and joints.

From Dr. Richard Loyd: 788

Staphylococcus coagulase positive

Produces many toxins and may cause food poisoning. Don't rely on this frequency alone.

From Dr. John Garvey: 643

Staphylococcus epidermidis

Normally part of the intestinal flora, this strain causes infections in those who are weak, elderly, and already debilitated from other pathogens. Infections are often found in wounds, including areas of the body that have implants (artificial valves or joints,

stents, shunts). Endocarditis (inflammation in portions of the heart and valves) is often caused by this pathogen, which produces copious biofilm.

From Dr. Richard Loyd: 475, 488, 575, 1232

Staphylococcus lugdunensis

Often causes endocarditis, inflammation of heart.

From Dr. Richard Loyd: 657

Staph, MARCoNS (Multiple Antibiotic Resistant Coagulase Negative Staphylococci)

Often found deep within the nasal cavity, especially in people with mold sensitivity and environmental illness. It produces many biochemical malfunctions, resulting in debilitating fatigue, high inflammation levels, digestive disturbances, and poor sleep.

I would use essential oils for this as well; see pages 693 and 828.

From Richard Loyd: 1232 (for 30 minutes). Sweep 1 Hz on either side of the main signal.

Staphylococcus mutans

Implicated in plaque and other dental conditions.

1980.47

Staphylococcus warneri

Causes disease mostly in the immunocompromised.

From Dr. Richard Loyd: 768

Staphylococcus, co-infections

Short Set; run for 10 minutes each: 48, 60, 453, 550, 634, 674, 1089, 1109, 7160

Longer Set: 6.8, 48, 60 + 100, 95, 120, 125, 160, 200, 300.2, 333 + 523 + 768, 424, 453, 464, 550, 634, 666, 674, 678, 727, 736, 738.3, 740.7, 742.2, 784, 786, 787, 802 + 1550, 875, 880, 885, 943, 952, 960, 999, 1050, 1089, 1109, 1184, 1241, 1266, 1560, 1840, 1998, 2K, 7160, 8697

Streptococcus / Strep

This common bacterium lives in the nose and upper respiratory tract. Its presence is so widely associated with red and white patches on the throat, and swelling of the tonsils and vocal cords, that often people refer to any sore throat malady—whether caused by this bacterium or not—as “Strep throat.” Other common symptoms caused by *Strep* include fever, headache, and upset stomach. Remedies include liquids, Vitamin C, and immune support. If this bacterium festers inside the body at subclinical levels, other conditions may occur later, including rheumatic and scarlet fevers, kidney disease, and perhaps autoimmune conditions as well. Even subclinical levels of *Strep* can impede progress with other problems; so if you're feeling stuck, rife for *Strep*. Use all of the frequencies because this microorganism frequently morphs.

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 369750 (lowest), 375K and 380K (optimal), 385400 (highest).

Hz set: 916.52 (lowest), 929.53 and 941.93 (optimal), and 955.31 (highest).

Another *Strep* set from Clark.

KHz set: 380600 (lowest), 385K (optimal), and 387400 (highest)

Hz set: 943.41 (lowest), 954.32 (optimal), and 960.27 (highest)

Streptococcus anginosus

Little known group, associated with abscesses.

From Dr. Richard Loyd: 566, 587

Streptococcus B (agalactiae)

Often present in the intestines or lower genital tract. Usually harmless to adults (unless they're already weakened), it can severely affect newborns with fever, lethargy, and difficulty eating or breathing.

From Dr. Richard Loyd: 476, 843

Streptococcus dysgalactiae

A major cause of bovine mastitis (inflammation, heat, swelling and pain in a dairy cow's udder).

From Dr. Richard Loyd: 258

Streptococcus enterococcinum

Often present in digestive and urinary infections.
409, 686

Streptococcus gallolyticus (formerly bovis)

Main cause of infective endocarditis (inflammation of portions of the heart) and of septicemia (blood poisoning).

From Dr. Richard Loyd: 889

Streptococcus haemolytic

Found in blood infections.

535, 1522 (both from Dr. John Garvey), 128, 134, 318, 333 + 523 + 768 + 786, 334, 368, 443, 542, 563, 611, 660 + 690 + 727, 675, 691, 710, 712, 880, 1203, 1415, 1902

Streptococcus intermedius

Causes lung and heart problems.

From Dr. Richard Loyd: 975

Streptococcus mitis

Lives in the mouth, sinuses and throat. Believed harmless except to the immune-compromised. Once it infects the mouth and teeth, it may also induce heart inflammation. It's resistant to penicillin

and other antibiotics, so use the frequencies and colloidal silver (see Chapter 3, **Colloidal Silver**).

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 313800 (lowest), 318K (optimal), and 321100 (highest)

Hz set: 777.83 (lowest), 788.24 (optimal), and 795.93 (highest)

Also from Clark: 788.24, 929.53, 941.93, 18670.15, 18919.09, 15832.29

Streptococcus oralis

Can infect the mouth.

354

Streptococcus pepto

Can infect digestive tract.

201 (from Dr. John Garvey), 629

Streptococcus pneumoniae

Can cause pneumonia, endocarditis (inflammation of membrane lining the heart), middle ear infections, peritonitis (inflammation of the mucus lining the intestines), arthritis, and meningitis (inflammation of membrane surrounding the brain and spinal cord).

From Dr. Richard Loyd: 683 and 688 (most effective), 625.5, 1136.7, 18187.4, 20015.3, 2273.4, 22938, 23000, 23032.8, 23138, 36374.8, 40030.6, 4546.9, 45856, 46000, 46065.5, 46275, 72749.6

Also try: 158, 201, 645, 771, 801, 845, 11780K

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 366850 (lowest), 368K (optimal), and 370200 (highest)

Hz set: 909.33 (lowest), 912.18 (optimal), and 917.63 (highest)

Also from Clark: 18321.64

From Royal Rife, possibly used on his #4 machine: 427K

Also try: 67, 231, 232, 268, 284, 536, 568, 683, 688, 728, 766, 776, 846, 1072, 1137, 2145, 2273, 8865

Streptococcus salivarius

Living in the mouth and upper respiratory tract, it's generally harmless until it enters the bloodstream. It may deplete white blood cells.

836

Streptococcus pyogenes / Strep A / Scarlet Fever

Causes scarlet fever (an airborne infection usually contracted by children) and other infections,

including cellulitis and impetigo. Symptoms of scarlet fever include rash, sore throat, flushed face, chills, abdominal pain, head and muscle aches, and a thick white coating on the tongue that peels after several days, giving a strawberry-like appearance. The child may not feel ill, but sometimes untreated scarlet fever can cause heart and kidney damage.

From Royal Rife, possibly used on his #4 machine: 720K

Also try: 437, 660 + 690 + 727, 784, 875 to 885, 2K, 10K

And then try: 20, 465, 787, 880

***Streptococcus pyogenes* / Strep Throat**

This strain causes the condition commonly referred to as “Strep throat.” Symptoms include skin inflammation, sore throat, and sores filled with pus (dead white blood cells). If not treated, it can develop into Scarlet Fever (see previous entry).

From Royal Rife, possibly used on his #4 machine: 720K

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 360500 (lowest), 373K (optimal), and 375300 (highest)

Hz set: 893.59 (lowest), 924.57 (optimal), and 930.28 (highest)

Also from Clark: 18570.58

Also try: 20, 465, 660 + 690 + 727, 784, 787, 875–885 (sweep), 880, 2K, 10K

***Streptococcus sanguinis* (formerly *sanguis*)**

Found mostly in dental plaque.

565

Streptococcus viridans

Major cause of endocarditis (inflammation of heart).

554 (from Dr. Richard Loyd), 425, 433, 445, 935, 1010, 1060, 8478, 457, 465, 777, 778, 1214, 1216

***Streptococcus*, Additional, Mutant Strains**

First try: 114, 437, 600 + 625 + 650, 660 + 690 + 727, 848, 883, 994

Also try: 108, 433, 488, 687, 732, 745, 754, 764, 833, 8686, 8777, 9676

Streptothrix

See “*Actinomyces*” entries in this section.

Treponema denticola

This spirochete causes gum disease and tooth socket infections. Recent research suggests that this and other *Treponema* species may also be implicated in Alzheimer’s.

From Dr. Richard Loyd: 842

***Treponema pallidum* / Syphilis**

The spirochete *Treponema pallidum* causes syphilis, a highly infectious disease that can cause lesions in the sexual organs, fever, headache, swollen glands, rash on the hands and feet, and ultimately blindness, heart disease, and insanity if not treated.

From Dr. Marty Monahan: 900, 789, 650, 625, 660, 511, 641, 633, 640, 827, 885

Also try: 600, 690, 727, 20, 120, 177, 658, 700, 902

From Royal Rife, possibly used on his #4 machine: 789K

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 346850 (lowest), 347K (optimal), and 347400 (highest)

Hz set: 859.76 (lowest), 860.13 (optimal), and 861.12 (highest)

Also from Clark: 17276.11

Typhoid Fever

See “*Salmonella typhi* / Typhoid Fever” in this section.

Ureaplasma urealyticum

A type of *Mycoplasma*. In the reproductive tract, it causes infertility, PID (pelvic inflammatory disease), vaginitis, problem pregnancies, premature delivery, and chorioamnionitis (infection of the placenta and amniotic fluid). It’s also involved in conditions afflicting newborns: low birth weight, neonatal pneumonia and conjunctivitis, and wound infections from Caesarian surgeries. In the urinary tract, it can cause nongonococcal urethritis and pyelonephritis. In the respiratory tract it causes pneumonia and lung problems. Also implicated in high blood pressure, and chronic infection of the central nervous system.

From Dr. John Garvey: 756

From Jimmie Holman, the most important frequencies: (5 minutes each) 36947.0805 and 36647.9105; (4 minutes) 49062.5205; (3 minutes) 36208.1405, 51177.5805, 37560.3105 and 51141.4405; (2 minutes) 37405.105, 48929.9105, 49062.5205, 36353.5505 and 51541.8305

***Vibrio cholerae* / Cholera**

Vibrio cholerae, very infectious in the small intestine, causes cholera. Symptoms include copious watery diarrhea (which can quickly lead to severe dehydration if left untreated), vomiting, muscle cramps, and weakness. Rarely transmitted by person-to-person contact, cholera is usually spread by contaminated water and food (often raw and improperly cooked seafood). The bacterium is found in salt water and near plankton. Epidemics have appeared in Russia, Iran, Iraq, Bangladesh, India, West Africa, Latin America, and Indonesia. Until 1992, only *Vibrio cholerae* serogroup O1 was associated with epidemic cholera. More recently, other serogroups have been identified—

including O139 (dubbed “Bengal”), reported in epidemic proportions in eleven countries in Southeast Asia.

Most people manage by drinking to replenish their bodily fluids, but some become so dehydrated that fluids must be given intravenously. Keep food clean and wash hands after using the toilet. Also see “*Salmonella typhi* / Typhoid Fever” in this section.

First try: 843, 844 (both from Dr. John Garvey), 330, 556, 591, 660 + 690 + 727, 691, 968, 1035

Also try: 450, 802 + 1550, 787, 880

***Yersinia (Pasteurella) pestis* / *Pasteurella* / Bubonic Plague / Black Death**

The rod-shaped bacterium *Yersinia pestis*, reclassified from its former name *Pasteurella*, causes the contagious Bubonic Plague. In the 14th century, when one-third the population of the Middle East, China and Europe died from the disease, Bubonic Plague was called Black Death because the facial skin of many of the people who died was dark. This infection occurs mainly in wild rodents, but it is transmitted to people who are bitten by fleas from infected rodents (especially rats), or contact infected animals such as domestic cats. Bubonic Plague can also be passed from person to person through the air or direct contact. Symptoms include high fever and chills, rash, vomiting and diarrhea, and the formation of buboes or swollen lymph nodes (particularly in the groin), which gives the disease its name. Pneumonia and other respiratory infections can lead to death.

Similar pathogens cause Pneumonic Plague (primarily infecting the lungs), causing fever, difficulty breathing, cough, bloody mucus, severe headache and rapid heartbeat; and Septicemic Plague (primarily infecting the bloodstream), with symptoms of fever, chills, abdominal pain, shock, and internal bleeding. All of these infections are dangerous and require immediate medical treatment.

Some strains of these microbes have become resistant to antibiotics. They are also reported to be used in biological warfare. Proper hygiene, pure drinking water, healthy food, and antimicrobials are essential for building the body's immunity. Don't rely solely on the frequencies!

333 (from Dr. John Garvey), 20, 210, 216, 333 + 523 + 768 + 786, 500, 660 + 690 + 727, 787, 880

BLOOD SUGAR PROBLEMS

Our junk food culture promotes blood sugar disorders. The brain needs a steady supply of glucose and cannot adapt well to, or compensate for, erratic changes in blood sugar (glucose) levels. This is why symptoms of blood sugar disorders are as varied as the many functions of the brain, which is involved in all sensory, motor, perceptual, cognitive, and emotional functions. A brain that's not fed properly becomes unstable.

Sugar handling issues are exacerbated by dietary sugars, refined carbohydrates, and (for most people) even complex carbs such as whole grains, potatoes and other starches, and fruit. Blood sugar disorders commonly indicate carbohydrate intolerance and/or insulin resistance. A diet of moderate animal protein, some healthy fats and oils, and low-starch vegetables nourishes the body without straining the pancreas or causing erratic secretions of insulin.

In 2006, the American Chemical Society published research showing the relationship between mercury and blood sugar disorders. Mercury disrupts the function of the hormone insulin, disables the beta cells of the pancreas (which produce insulin), and disturbs the insulin receptor sites in all of the body's cells. Heavy metals such as arsenic, lead and aluminum also disrupt glucose metabolism.

Regular exercise is very important for any blood sugar disorder. During exercise and for several hours afterward, the transport of glucose into the cells is increased due to the cells' greater receptivity to insulin.

Blood sugar problems require a comprehensive approach due to their many causes. Ozone therapy can be helpful.

A surprisingly large number of people test positive for pancreatic flukes, so see **PARASITES, PROTOZOA AND WORMS**, "*Eurytrema pancreaticum* / Pancreatic Fluke." Parasites can disrupt the function of organs and glands, even to the point of causing degenerative diseases.

Diabetes / High Blood Sugar / Hyperglycemia

Diabetes, or excessively high glucose levels in the bloodstream, causes a craving for sweets or carbohydrates, including fast-metabolized alcohol. Common symptoms include susceptibility to infection, poor circulation, slow healing of wounds and bruises, and even depression. If untreated, diabetes can lead to acidosis, featuring abdominal pain, drowsiness, nausea, vomiting, difficulty breathing, and ultimately coma.

This complex condition is sometimes noted according to the age at which people are affected, but classifying diabetes according to its causes is more common and more informative. With Type 1 diabetes, the pancreas is not producing enough insulin to assist the glucose across the cell membranes. This pancreatic insufficiency or imbalance may be due to autoimmune destruction of the insulin-producing cells. In some people, malfunctioning adrenal or pituitary glands may affect the amount of insulin secreted by the pancreas or even the timing of the secretion. With Type 2 diabetes, the pancreas produces enough insulin and there is enough insulin in the bloodstream; but the cells of the body are either resistant to insulin or lack enough working insulin receptor sites to allow the hormone to penetrate the cells. The sluggishness of the receptor sites may at least partly result from pathogens whose wastes are clogging the sites.

Blood sugar levels must remain within a certain range. If glucose is not immediately being utilized as energy by the cells and is left to circulate in the bloodstream, microorganisms will feast and proliferate. The tissues will also acidify. This explains why diabetics are prone to infections. Sometimes the flesh becomes so decayed that limbs are amputated. This extreme level of decay indicates fermentation and the presence of fungi. An associated condition is malformed red blood cells, which clump together due to insufficient oxygen in the bloodstream (and correspondingly decreased electrical charge). The resulting inability of red blood cells to pass through tiny capillaries explains the problem of poor circulation.

Recent medical discoveries suggest the degree of autoimmune involvement in diabetes. In 1999, Dr. Hans Michael Dosch published a paper on the similarities between diabetes and Multiple Sclerosis. Noting an overabundance of pain-signaling nerves around the insulin-producing cells of the pancreas, he and a colleague injected capsaicin (the phytochemical that makes chili peppers hot) to kill the overactive pancreatic sensory nerves in diabetic mice. Almost overnight, normal insulin production began and the mice became healthy. The doctors concluded that the lack of insulin production

Nutrients for Healthy Blood Sugar Levels

Except for perhaps *Tecoma stans* and *Pata de vaca*, the following have been extensively researched and verified to beneficially affect blood sugar levels. They confer other benefits as well.

Balances

- ◆ **Chromium and Vanadium.** Minerals that work together to help the body utilize glucose, thereby reducing carb cravings. People with blood sugar issues have higher requirements of these nutrients.
- ◆ **L-glutamine.** Sweet-tasting amino acid feeds the brain and curbs carb cravings (also builds muscle and repairs gut). Take 1 teaspoon in water before meals.
- ◆ **Vitamin B3 (Niacin).** Increase amounts slowly; it causes skin to flush as it pulls toxins from tissues.

Lowers Insulin Resistance (and thus Blood Sugar)

- ◆ **Aloe vera.** ½ teaspoon daily for 4–14 weeks.
- ◆ **Bitter Melon (*Momordica charantia*).** Boil in water and drink as tea; don't eat raw. Activates enzyme that transports glucose from bloodstream into cells (the same enzyme that's activated by exercise).
- ◆ **Cedar berries (*Juniperus monosperma*),** a different species than juniper berries which can be toxic at high levels). Regenerates pancreas' insulin-producing cells.
- ◆ **Chlorella and Spirulina (algae).** Don't take if you're on anticoagulant drugs; their Vitamin K causes the blood to clot. Be careful with chlorella if you have heavy metal toxicity (see pages 624–626).
- ◆ **Cinnamon Bark, Sweet (*Cinnamomum Zeylanicum*).** Lowers blood glucose only modestly; has more success with pre-diabetic state.
- ◆ **Ginger Root.** Increases cellular glucose uptake without a need for insulin. Also anti-inflammatory.
- ◆ **Ginseng Root (*Panax ginseng*, *American ginseng*).** Lowers carb response in everyone; but diabetics and non-diabetics should take it at different times.
- ◆ **Gymnema sylvestre (*Shardunika*).** Regenerates insulin-producing cells of pancreas.
- ◆ **Neem Leaf and Seed.** Reduces need for insulin. Monitor sugar levels, which might drop too quickly.
- ◆ **Pata de vaca (*Bauhinia forficata*) Leaf.** Amazon rainforest herb used as insulin substitute, sometimes reported as the best blood glucose reducer.
- ◆ **Stevia (whole leaf, not extract).** Also protects liver and kidneys. However, some don't like the taste.
- ◆ **Tecoma stans.** Flowering shrub in the trumpet vine family native to warm wet climates. Used in Mexico for centuries to lower blood sugar.
- ◆ **Turmeric Root.** Powerful insulin sensitizer. Prevents onset of diabetes when taken for nine months. Also protects brain and has anti-tumor effects.

was due to inflammation (and eventual death) of insulin-producing cells. Eliminating the inflammation allowed the cells to function properly. The inflammation apparently also caused insulin resistance. The second link to autoimmune malfunction was made when researchers at the University of Helsinki, Finland, noted a marked increase in diabetes in those who had been fed cows' milk as very young infants. The bovine insulin proteins that had remained intact in the cow's milk were treated as a foreign substance by the human immune cells. After a decade or two, in some adults the immune cells began attacking the human pancreas cells that produce insulin. It's believed that something in the environment or diet triggered the later autoimmune response. The development of diabetes in children who were breast fed was significantly lower than in those fed cow's milk. The studies did not mention the type of milk, but the milk was undoubtedly homogenized and pasteurized rather than healthfully raw; it contained additives such as bovine growth hormone; and it was produced by breeds of cows whose proteins are opiate-like irritants and allergens (see Chapter 3, **Food**, for details).

To treat diabetes, conventional doctors typically prescribe insulin injections to substitute for the insulin that the pancreas isn't secreting. However, most insulin today is synthetic, produced from genetically modified yeast. Its proteins have a very different structure and pattern of folds than those in natural human insulin. This manufactured insulin can have toxic effects, causing cardiovascular problems, cancer, and high rates of death. It may also accelerate the progression of Type 2 diabetes.

Also see, under **GLANDS**, frequencies for balancing the **Adrenals**, **Pituitary**, **Pancreas** and **Thyroid**. Also see **PARASITES, PROTOZOA AND WORMS**, "*Eurytrema pancreaticum* / Pancreatic Fluke"; and **CHEMICAL SENSITIVITY / POISONING**, "Mercury, Aluminum, and Other Contaminants." Also see "Mucormycosis / Zygomycosis" (which often accompanies diabetes), and other fungal forms that may pertain, under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

Be careful with the frequencies between 2000 and 2080! Many users have reported (and I have personally witnessed) a substantial, sudden drop in blood sugar levels after these frequencies were run.

From Bruce Stenulson: 324, 528, 15 in that order, for 4 minutes each. These frequencies are also used for high blood pressure.

1.2 + 250, 6.8, 9.39, 9.4, 15, 20, 35, 40, 48, 72, 95, 125, 240, 302, 440, 465, 484, 500, 522, 600 + 625 + 650, 700, 787, 800, 802 + 1550, 803, 880, 440, 444 + 1865, 428, 1K, 1550, 1800, 1850, 1865, 2K, 2003, 2008, 2013, 2050, 2080 (for 3 minutes), 2127.5, 2170, 2720, 4K, 4200, 5K (for 15 minutes), 10K, 40K

1.2 + 250, 20, 333 + 523 + 768 + 786, 832, 1050, 5K, 40K

Hypoglycemia / Low Blood Sugar / Hyperinsulinism

A complex condition causing many symptoms, including vertigo, cramps, abdominal bloating, rapid heartbeat, cold hands and feet, trembling from skipped meals, fatigue, fainting, indigestion, headaches, muscle pains, difficulty in concentrating, depression, moodiness, and a craving for carbohydrates and sweets.

Although not as well known as diabetes, hypoglycemia can be a precursor to diabetes. It can usually be prevented, managed, or eliminated altogether through proper diet. Normally, the pancreas secretes insulin to help transport glucose across the cell membrane and nourish it. However, if one eats too many carbohydrates or sugars at one sitting, too much glucose is released into the bloodstream; and the pancreas, responding to this abnormally high outpouring of glucose into the blood, oversecretes insulin. With excess insulin in the blood, too much glucose reaches the cells too fast, resulting in a sudden drop of available energy. This drop in energy causes hunger and food cravings. The person typically eats something sweet or starchy to bring up their energy level, and the whole cycle repeats all over again. This yo-yo effect puts enormous stress on many glands the pancreas, adrenals, pituitary, liver, thyroid, and sometimes even the ovaries or testes.

The strong emotional component to hypoglycemia is due to the release of hormones. If there's not enough glucose in the blood to feed the brain, it sends a signal to the adrenal glands to produce adrenaline, which stimulates the liver to release its stored glycogen into the bloodstream as glucose. But adrenaline, the “fight-or-flight” hormone, can cause moodiness, depression and panic.

To control and ultimately reverse hypoglycemia, it's mandatory to have a clean diet, high in animal protein and healthy fats, without sugars and most carbohydrates. Animal proteins and fats provide a slow, steady supply of energy that doesn't cause the pancreas to react in “alarm” mode. Read Carlton Fredericks's definitive *New Low Blood Sugar and You*.

Also see, under **GLANDS**, the balancing and normalizing frequencies for **Adrenals**, **Pituitary**, **Pancreas** and **Thyroid**. See **PARASITES, PROTOZOA AND WORMS**, “*Eurytrema pancreaticum* / Pancreatic Fluke.” Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*,” as fungal forms are often present with blood sugar disorders.

1.2 + 250, 3 + 230, 10, 20, 26, 72, 95, 125, 444 + 1865,

You may not need every frequency in an entry.

To determine which ones you need, try muscle testing or dowsing (see Chapter 4).

600 + 625 + 650, 464, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2008, 2127.5, 2170, 2720, 2489, 40K

End of Blood Sugar Problems section.

BOIL

See under **SKIN**.

BONE AND SKELETON

Bone contains different types of cells, arranged as either random fibers or as part of a mesh-like spongy matrix, structured somewhat like a honeycomb. Skeletal bones are connected to muscles by tendons, and to other bones at the joint by ligaments. The skeletal bones in the body are made of slightly different material than the teeth, which are even harder to withstand the stress of grinding and chewing.

Despite its density, bone is very lightweight. It's brittle, but possesses some degree of elasticity. Bone marrow, made and stored mostly in the long bones of the body, produces cartilage, more bone, and new blood cells (leukocytes, red blood cells, and platelets). The stem cells also present in the bone marrow can transform into many kinds of tissue.

Bone is a living, ever-changing tissue, consisting of many types of cells fed by blood vessels. Some cells form a hard connective tissue made of collagen. Some cells help mineralize bone with calcium phosphate and other mineral salts. And still other cells produce hormones such as prostaglandin. In the past two decades, research by geneticist and endocrinologist Gerard Karsenty has shown that osteocalcin, a protein-based hormone found in high concentrations in the skeleton, is sent by bone to regulate crucial processes throughout the body—including male fertility (testosterone production increases) and improved blood sugar regulation (it increases insulin sensitivity and amounts). Osteocalcin has also been found to favorably influence sleep, prenatal brain development, cognitive functions (including learning and memory) and emotional responses (such as depression and anxiety). These findings explain why brain function and mood improve with weight training and other load-bearing exercise, and even walking.

A common problem with bone is a fracture. If aligned properly and held together by a splint or cast, the bone will repair itself by forming new cells—first chaotically arranged, and then shaped into a pattern, over time. Repeated stress on a bone (such as from a fracture) generates small amounts of electrical voltage. It is this charge that allows the bone to repair itself—a process that doctors are now duplicating with electromedical devices to speed healing. In *The Body Electric*,

Dr. Robert Becker describes applying minute amounts of electrical current to fractures to help the bone mend quickly.

Degenerative bone breakdown is common, due to immune malfunction, mineral imbalances in the blood, and thyroid disorders. However, dietary changes can favorably alter the condition of bone. Because bone dissolves to give the body calcium salts (which it needs in the blood for metabolic purposes), bone can also reabsorb these salts once the calcium levels in the blood are normal. Vitamin C deficiency can play a huge role, causing what some call “scurvey of the bone.”

If bones are out of position, see a chiropractor. However, if the muscles are tight, they may pull on the bones and cause misalignment; so pay attention to muscles that might be in spasm. For frequencies involving muscles and nerves, see **MUSCLES, BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, and **INJURIES**.

Ankylosing Spondylitis / Bechterew's Disease (Europe)

Degenerative inflammatory condition involving the spine and adjacent soft tissues, and often the hip and shoulder joints. Symptoms include pain, sometimes accompanied by fever, anemia, and enormous fatigue.

1.2 + 250, 7.69, 7.7, 10, 28, 35, 60 + 100, 95, 110, 428, 600 + 625 + 650, 680, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 3K, 40K

Back Pain, to Reduce

Back pain often results from tight muscles, and secondarily a misalignment of the spine. Kidney inflammation or infection is a less frequent cause of back pain. There may be a strong emotional component: the phrase “holding back” indicates unexpressed emotions, which cause the back muscles to contract. Thus, back pain can be addressed using both physical and psychological approaches. The Magnetex[®] pulls painful debris out of the tissues (see Appendix C) that causes pain. Also consider massage, chiropractic, or osteopathic adjustments. Exercises to strengthen the back muscles can be found in Pete Egoscue's book *Pain Free*. Don't rely on frequencies alone.

15, 17, 326, 677 (for 20 minutes), 760 (for 10 minutes), and sweep 326–328

From Dr. Richard Loyd (for neck pain as well, and in this order): 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 138.57, 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 138.57, 155.56, 185, 207.65, 233.08, 138.57, 155.56, 185, 207.65, 233.08, 4.9, 6, 9.19

Backache, including Spasms

A spasm is a movement due to a sudden involuntary muscular contraction, and it can be quite painful. Many pathogens can be involved, particularly *Staphylococcus*. These frequencies are not a substitute for a chiropractic adjustment if the skeletal alignment is off or the spinal cord is torqued or twisted. Muscle spasms often indicate a

magnesium deficiency. Lower back pain indicates a serious kidney disorder more often than you might think, so also see frequencies under **URINARY TRACT, Kidneys**.

First try: 519.34 for 20 minutes.

Then try: 26 (for 15 minutes), 33, 41.2, 120, 146, 160, 212, 240, 305 (for 6 minutes), 326, 333 + 523 + 768 + 786, 424, 464, 466, 522, 528, 555, 660 + 690 + 727, 760, 784, 787, 789, 800, 802 + 1550, 880, 1552, 2112, 2720 (for as long as needed), 3K, 5K, 10K, 40K

Bone Spur

See “Spur, Bone” in this section.

Calcium Metabolism and Utilization, to Improve

Parathyroid disturbance can cause either an excess or a deficiency of calcium in the blood.

First try: 9.6, 10K

Then try: 326, 328, 673.1, 771, 4760.5

Cerebrospinal Conditions

10K, 40K (for as long as desired)

Costalgia

Rib pain, several possible causes. Also see frequencies under **MUSCLES** or under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

880, 787, 660 + 690 + 727, 160, 26, 3K, 1500, 802 + 1550, 2720, 10K, 40K

Disc, Herniated

If the “shock absorber” cartilage between each spinal vertebra changes structure or shape, pressing on the spinal cord or nerve rootlets, this often causes pain.

First try: 15, 25.4, 324, 660 + 690 + 727

Then try: 787, 2720, 10K, 40K

Disc, Slipped / Spine, Misaligned

Misaligned vertebra of the spine that pinches a nerve, causing pain and interfering with the posture and function of the body. Even if a slipped disc results from spasms due to microbial toxins, you'll still need a chiropractic adjustment to align bones that are out of place. Also see “Backache, including Spasms” in this section.

20, 26, 57, 72, 95, 125, 146, 333 + 523 + 768 + 786, 555, 787, 660 + 690 + 727, 880, 40K

Dystonia, Osteitis that accompanies

Bone inflammation that often accompanies flabby muscle tone in the gallbladder (which is comprised of muscle fiber).

2.65, 20, 724, 736, 743, 770, 787, 660 + 690 + 727, 880, 3K, 40K

Elbow pain / Epicondylalgia

1.2 + 250, 26, 160, 2720, 3K, 10K, 40K

Fractures, Cuts and Trauma, to stimulate healing

Physicist Gary Wade reports great success with 1028 Hz, delivered as a square wave with a pad unit at an output voltage of between 3.6 and 6.3 volts. Put an electrode patch on either side of the fracture. Or, say with a degenerating hip, put an electrode on the front and back sides. Some people leave their unit on all night safely, as long as the voltage is not too high and the DC offset is *off*. This also works very well for knee cartilage and connective tissue damage. You can also run 40K for as long as you want. Make sure to take the requisite nutrients so the body has raw materials for repair.

Also try: 7, 25, 50, 220, 380, 418.3, 787, 880, 2720

Fusion

See “Ankylosing Spondylitis / Bechterew’s Disease” in this section.

Infection in Bone

47, 600 + 625 + 650, 660 + 690 + 727, 787, 776, 880, 1600, 1800, 10K, 40K

Inflammation in Bone

See “Osteitis” in this section.

Kieferosteitis

A type of bone inflammation with enlargement and pain. 384, 432, 516

Loss of Bone, to Regenerate

7, 424, 465, 660 + 690 + 727, 784, 787, 880, 1552, 1560, 1577, 2720, 10K, 40K

Mastoiditis

Inflammation of the mastoid bone, behind the ears. 287

Multiple Myeloma

See under **CANCER**.

Neck Pain

See “Back Pain, to Reduce” in this section.

Numbness and Tingling from Pinched Nerve / Paresthesia

Not a substitute for a chiropractic adjustment. Also see “Subluxation / Spine Distortion” in this section. 5.5

Osteitis

Inflammation of bone with irregular cells. It may be accompanied by gallbladder dystonia, or impaired tone of the muscle fibers that comprise the gallbladder. 2.65, 20, 660 + 690 + 727, 724, 736, 743, 770, 787, 880, 3K, 40K

Nutrition for Bones

- ◆ **Calcium.** Mineral. Almost all calcium in the body is in the bones and teeth. Provides bone structure.
- ◆ **Clay.** Edible clay contains many minerals that help bones. Taken internally or used as a poultice (see Chapter 3).
- ◆ **Magnesium.** Mineral involved in over 300 biochemical reactions. Calcium will not enter bone without magnesium.
- ◆ **Boron.** Mineral. Helps maintain skeletal strength by adding to bone density. Prevents osteoporosis.
- ◆ **Phosphorus.** Mineral. Helps build strong bones.
- ◆ **Vitamin K2.** Unlike Vitamin K1 (involved in blood coagulation), K2 helps with bone strength.
- ◆ **Vitamin D3.** Helps absorption of calcium and phosphorus.
- ◆ **Silica.** Mineral. Helps strengthen bones.
- ◆ **Zinc.** Mineral. Protects bones against breakdown.
- ◆ **Comfrey.** Herb. Helps bones knit together. Taken internally, and used in poultices.

Osteoarthritis

The formation of bony protrusions, often in the joints. 770, 1500, 40K

Osteomyelitis

Inflammation of the bone marrow.

2.65, 660 + 690 + 727, 770, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2008, 2127.5, 2170, 2720, 2489, 40K

Osteoporosis

Softening and degeneration of bone. The body, which needs calcium for vital metabolic processes such as the transport of nutrients across the cell membrane, leaches calcium from the bones when there’s not enough free calcium in the body. However, without magnesium and boron, a proper acid-alkaline balance, Vitamin D, and balanced electrolytes, the calcium is unavailable to the body. Dr. Sherrill Sellman points out that osteoporosis was purposely misdiagnosed by the pharmaceutical industry to sell drugs—and that synthetic hormones, dairy products, and most calcium supplements actually make the problem worse. Consult a knowledgeable holistic practitioner for nutritional support, as bone deterioration can be stopped and reversed. Don’t rely on frequencies alone to solve this problem.

470.5, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 1600, 1800, 40K

Paresthesia

See “Numbness and Tingling from Pinched Nerve” in this section.

If You Have a Broken Bone in a Cast, Treat the Other Side with an Electrode Unit

Apply electrodes on either side of the sturdy arm or leg—the one that's *not* in the cast—over the same area as the break in the injured limb. By applying electrodes to the leg that you *can* access, the injured side can “learn” from the side that's being treated. This is because most acupuncture meridians are symmetrically placed on both sides of the body. Energizing one side will energize the other. (This will also work with a laser or LED. However, because the light may also penetrate a cast, you can directly address the afflicted side.)

Slipped (Misaligned) Disc

See “Disc, Slipped / Spine, Misaligned” in this section.

Spur, Bone

A knob of bone or hard tissue that protrudes through the skin, causing pain, numbness, sensory loss, and sometimes muscular atrophy. Bone spurs are formed when soft tissue adjacent to a stressed structure becomes calcified. Weak joints, bone misalignment, and an increase in weight can stress and inflame a joint and surrounding area, causing the calcium growth. As bone spurs can crush nearby nerves, blood vessels and soft tissue, surgical removal might be necessary. Also see **INJURIES**, “Heel Pain / Plantar Fascitis” and **ARTHRITIS**, “Rheumatoid Arthritis.”
1.2 + 250

Subluxation / Spine Distortion

Twisting of muscles and spine. Dislocation of bones or organs, which can pinch nerves and cause pain. This is not a substitute for a chiropractic adjustment. Also see “Numbness and Tingling from Pinched Nerve / Paresthesia” in this section.

9.1, 9.6, 66, 110

End of Bone and Skeleton section.

BORDETELLA (PARA) PERTUSSIS / WHOOPING COUGH

See under **BACTERIA**.

BORNA VIRUS / BORNA DISEASE VIRUS (BDV)

See under **VIRUSES**.

BORRELIA / BORRELIOSIS

See under **BACTERIA**.

BOTRYTIS CINEREAS

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

BOTULISM / BACILLUS BOTULINUM

BOVINE MASTITIS

See “*Streptococcus dysgalactiae*” under **BACTERIA**.

BOVINE SPONGIFORM ENCEPHALOPATHY (BSE) / MAD COW DISEASE

See **PRIONS / AMYLOIDOSIS**.

BRACHIAL NEURALGIA

See “Neuralgia, Brachial” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS

Our mental and emotional states so heavily depend on the proper biochemical function of the brain and nervous system that the psychological cannot be easily separated from the physiological. Thus, the physiological categories of “brain” and “nervous system” are combined here with the less tangible “mind” and “emotions.”

In humans, the easily visible cerebrum with its many folds and wrinkles is the largest section of the brain. Other structures include the cerebellum, limbic system (or “reptilian” brain), and brain stem. The brain contains meninges, three layers of connective tissue membranes that separate the skull from the soft brain tissue. Cerebrospinal fluid circulates between two layers of meninges and brain cavities, acting as a shock absorber. The blood vessels (also between two meninges layers) contain tightly packed cells that form the blood-brain barrier, which protects the brain from toxins in the blood. However, there are still thousands of synthetic chemicals and drugs that can pass this barrier.

The human brain weighs about 35 to 53 ounces (1 to 1.5 kilograms). It is so dense, it would collapse under its own weight if it did not float in the cerebrospinal fluid. The brain regulates intelligence, cognition, emotions, memory, motor skills, sensory input, and involuntary bodily functions including heart rate, blood pressure, fluid balance, and body temperature. The spinal cord is only responsible for simple reflexes and certain types of movement.

Neurons (nerve cells) possess a head with long, delicate hair-like tendrils and a stem encased in a fatty myelin sheath, which provides structure and insulation and helps eliminate waste. Neurons generate minute but potent electrical currents that convey information to other cells. One neuron connects to at least a thousand other neurons in an intricate biological-electrical circuit. Electrical messages travel from the brain through the spinal cord to the rest of the nerves in the body. There are different types of nerves for different kinds of activity: sensory input, temperature, touch and movement, as well as visual, auditory, and olfactory neural pathways.

The autonomic (automatic) nervous system is divided into voluntary and involuntary systems. The voluntary nerves control functions such as muscle movement. The involuntary nerves are further classified into the sympathetic and parasympathetic nervous systems, which have opposite physiological, emotional, and psychological effects (see chart on page 650). Negative stress or danger is processed in several

locations. Input first goes to the cerebral cortex, then to the limbic system in the hypothalamus. This activates the autonomic nervous system, and the fight-or-flight reaction begins. Interactions between the hypothalamus, pituitary, and adrenals are intricately involved in our stress response.

Some of the psychological suffering on this planet is politically and culturally enforced. Most people want to love and be loved. But either they aren't shown how, or they're actively discouraged from openly reaching out to others in a loving manner. This lack of love is especially prominent in technologically advanced, industrialized cultures that emphasize the acquisition of things instead of creative expression; teach obligation and social propriety instead of authentic respect for self and others; and favor technology over the natural world. Mental health is largely defined and enforced by the political institutions of mainstream psychiatry and psychology. These institutions preach the status quo, which states that people must conform and be obedient and unquestioning, foregoing creativity and intelligence—unless these traits are harnessed in service to the power elite. In totalitarian states, deviations from or disagreements with these standards are classified as illness.

Nevertheless, mental health and emotional distress are real issues, certainly to the sufferer. And antisocial behaviors—which in part are due to suppression of people's genuine needs—often reflect emotional turmoil.

Cognitive confusion, emotional instability, and neurological disorders are not only affected by constant stress, fear, survival issues and negative belief systems, but also by nutrient starvation, pathogens, fatigue, toxins, and electromog. If the brain and nervous system are not properly nourished, then our thinking, feeling, perceiving, and motor control are adversely affected. Over 80% of the brain and nerve cells (including the myelin sheaths that surround the long stems of the nerves) are comprised of fat. The myelin provides insulation for the nerves, similar to how rubber covers copper wires in an electrical circuit. Healthy fats are the myelin, and minerals are the electrical wiring. We need both in our diets in order for our brain and nerves to function properly. This is why we need to replenish healthy fats and minerals every day.

Pathogens are often present in people with mental disturbances for several reasons. Stress hormones create an acidic environment, which breeds pathogens. Upset people tend to overeat sugars, starches or alcohol, or use “recreational” drugs or be prescribed toxic pharmaceutical drugs—all of which help create a terrain favorable to pathogens. Finally, someone who hosts many harmful microorganisms also carries more microbial waste, which can induce psychiatric symptoms. Just a few examples of mind-altering pathogens, which modern medicine recognizes, are malaria, Legionnaire's disease, syphilis, typhoid, diphtheria, *Candida*, HIV, rheumatic fever, and *Herpes*.

Environmental toxins frequently cause, or are implicated in, mental and emotional suffering. Brain lesions, epileptic seizures, and symptoms similar to Multiple Sclerosis,

Parkinson's disease, and other nervous system conditions can be caused by the ingestion or inhalation of the toxic metals mercury and lead, the petrochemicals benzene and toluene, the artificial sweetener aspartame (in many foods and drinks, including diet soda), over-the-counter and prescription drugs, and synthetic additives and preservatives. Any contaminant, such as nitrates (added to processed meats), disrupt the beneficial intestinal flora, contributing to the manic phase of bipolar disorder. What affects the gut (known as the “second brain”) also affects the brain, because both respond to the same neurochemicals. (See Chapter 3, **Detoxification**, for more information on toxins and their removal.)

Electromog (electrical pollution / dirty electricity) plays a huge role in mental health. Watching TV, and using mobile phones and computers—especially at night—make people more unhappy and lonely, as well as prone to developing bipolar disorder, insomnia, and other issues.

Structured psychological support can be helpful in many cases. Frequencies are not a replacement for Reichian therapy, PSYCH-K®, hypnosis, or other emotional healing work. The self-administered Emotional Freedom Technique (EFT) is reported to have a high success rate in reducing stress and lessening, if not completely eliminating, negative physical and emotional conditions (see Appendix A).

Nerve conditions may also be connected to excess mucin—a hydrophilic (water-loving), sugar-protein compound naturally present in the connective tissue that surrounds and binds nerve cells together. When mucin is present in abnormal amounts, excess water accumulates and health problems result. Over half of those who suffer from hypothyroidism have excess mucin in their bodies, so also see **Glands, Thyroid**, “Thyroid, Underactive / Hypothyroidism.”

The brain cannot manufacture its own fuel. It depends on precisely controlled amounts of glucose in the bloodstream. Thus, many people with diabetes and hypoglycemia experience depression; see **BLOOD SUGAR PROBLEMS**. Also see “Mercury, Aluminum, and Other Contaminants” and other entries under **CHEMICAL SENSITIVITY / POISONING**. The Lyme spirochete is often present in neurological disorders, so see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease.” Also consider the role of prions, especially in dementia-like ailments. See **PRIONS / AMYLOIDOSIS** for more details, including information on how to remove them.

Mental and emotional disorders, along with illnesses of the brain and nervous system, are complex and multifaceted. Experiment to find what protocols work best for you.

General Aid, Toxin Related

4.9, 20, 72, 95, 125, 146, 428, 522, 802 + 1550, 10K, 40K

General Nerve Conditions

Try in this order: 40K, 10K, 2720, 2489, 2170, 1800, 1600, 660 + 690 + 727, 650 + 625, + 600, 880, 787, 802 + 1550, 125, 95, 72, 20, 440, 40K

Nutrients for the Brain and Nervous System

- ◆ **Essential Fatty Acids (EFAs).** Many brain and nervous system disorders can be corrected by EFA supplementation. The best fats for the nervous system are from grass-fed beef, fresh fatty fish, raw dairy (if tolerated), and coconut and (smaller amounts of) olive oils. Fresh ground flax is sometimes recommended, but many people lack the enzyme that converts flax into the type of fatty acids that the body can use.
- ◆ **Magnesium.** For the mineral-hungry neural wiring of the body, magnesium is key: It's utilized in over 300 body processes. Due to contaminants and deficiencies in our water and food, most people are deficient. Inadequate magnesium may be a key cause of many neurological problems, including stroke, Parkinson's, migraines, schizophrenia, bipolar disorder, Alzheimer's, and even autism.
- ◆ **Lithium orotate (the mineral, not lithium carbonate the drug).** In all tissues of the body. Lithium helps 85% of those suffering from stress, emotional problems, and physical illness. It protects the brain from the effects of heavy metals, pharmaceuticals and microbial toxins; raises low white blood cell counts; helps with liver disorders; and alleviates discomfort from migraines and cluster headaches. It may also hinder the reproduction abilities of many viruses. German medical doctor Hans Nieper found that the best form of the nutrient is lithium orotate, because the orotic acid salt, to which the lithium is bound, easily crosses the blood-brain barrier in low amounts and releases the lithium into the brain. Lithium orotate reduces to elemental lithium. It's the mg amount of elemental lithium that people follow when they take lithium orotate. Most people require between 5 and 15 or even 30 mg a day, although Dr. Jonathan Wright administers up to 40 mg a day without unwanted effects. People with alcoholism have safely taken up to 150 mg of elemental lithium a day. Lithium's use for so many emotional and addictive disorders suggests that those who suffer from imbalances might simply be deficient in this trace mineral.
- ◆ **Turmeric Root.** This powdered root, widely used in Indian cooking, provides high levels of protection to the brain and nervous system. Curcumin (which gives turmeric its bright golden color) is used for bipolar disorder, psychoses, depression, post-traumatic stress disorder (PTSD), obsessive-compulsive disorder (OCD), and even autism. An antioxidant and anti-inflammatory, turmeric is also effectively used as protection against cancer.
- ◆ **Amino Acids.** Deficiencies of these protein building blocks play a huge role in mental and emotional health because neurotransmitters are comprised of amino acids. For emotional or mental imbalances, some people take 1 teaspoon of L-glutamine powder with ¼ teaspoon of L-tyrosine powder, under the tongue several times a day. These two amino acids must be taken together, and in powder form, for the brain to benefit. L-glutamine also helps curb carbohydrate cravings and balance blood sugar levels, whose disruption negatively affects mental health. Taken in larger amounts (1 tablespoon three times a day), it heals the gut. L-glutamine has a naturally sweet taste, so it's easy to eat and can be added to other foods.
- ◆ **Proper Balance of Proteins, Fats and Carbohydrates.** Most people eat too many carbohydrates, refined or otherwise. Excessive carbs deplete the system of Vitamin B1 (thiamine), which is critical to brain and nerve function. B1 deficiency can cause mood swings, irritability, depression, confusion, and fatigue. Chemical additives and other non-foods also deplete nutrients and prevent them from being absorbed. Extremely sensitive people may simply have higher requirements of certain nutrients than other people, and suffer from deficiencies that cause symptoms we call "illness."
- ◆ **Real Foods.** Diet plays a major role in mental health. Don't eat fake food or gluten! Gluten, a sticky protein compound in wheat and other grains, interferes with neurotransmitter receptors and thus causes many neurological problems. About 50% of people who are depressed are estimated to have high levels of antigliadin enzymes (gliadin is one of the allergenic components of gluten). Because gliadin destroys the lining of the gut, it causes an unlimited number of disorders ranging from joint pain to schizophrenia. Casein, a milk protein, has similar effects (see Chapter 3, **Food**). Gliadin and other allergens in gluten, along with milk proteins (casein), also destroy the beneficial friendly intestinal bacteria. Friendly flora in the gut are one of the major contributors to mental health. The gut is literally the "second brain," so what affects the gut affects the brain. (Almost 90% of the neurotransmitter *serotonin*, which induces calm and well-being, is produced in the gut.) In *The Mood Cure*, Julia Ross explains how to correct the nutritional deficiencies involved in depression, addictions, obsessive-compulsive disorder (OCD), uncontrollable anger and rage, and more.

Actinomycosis

Infection of the brain, lungs, gastrointestinal tract or jaw caused by the fungus *Actinomyces bovis*.

1.1 + 73, 20, 160, 220, 464, 660 + 690 + 727, 787

Addiction to Food, Alcohol or Drugs

Also see “Alcoholism,” “Calming, to Produce,” and “Depression” in this section. Read *The Mood Cure* by Ross. From Dr. Loyd: 830.61, 783.99 739.99, 15.9, 698.46, 659.26, 622.25, 587.33, 554.37, 523.25, 493.88, 466.16, 440. Also try 20.

Akathisia / Agitation

Nervousness and restlessness commonly associated with the inability to remain seated. The so-called “side effects” of certain drugs such as Prozac® can create jitteriness, anxiety and tension that appear similar to the characteristics of Attention Deficit Disorder. A magnesium deficiency may exist. The frequencies below are also used for insomnia. Also see **SCHUMANN RESONANCES**.

3 + 230, 7.83, 40K

Alcoholism

The over-consumption of ethanol alcohol (beer, wine, hard liquor) that among other symptoms causes edema of the brain, tissue degeneration, abnormal respiration, impaired judgment, incoherent speech, lack of muscular coordination, and depression. Alcohol consumption often leads to antisocial behavior ranging from drunk driving to interpersonal violence, but alcoholism is more than a behavioral, social or even emotional problem. It both reflects and causes imbalances of the brain. The “high” one feels when drinking is from neurological impairment.

Alcohol causes nutrient deficiencies, just as nutrient deficiencies can cause alcohol addiction. Sugar is metabolized poorly (which may indicate hypoglycemia or diabetes), so the person craves alcohol in an attempt to instantly replenish sugar levels. Thus, alcoholism can be regarded as the addiction to rapidly metabolized sugars and carbohydrates in the form of alcohol.

Subjects probably harbor fungi and parasites that are clamoring to be fed their favorite food (easily assimilable sugars)—causing the human host to develop an addiction to alcohol (or sugar) in order to feed them. Eliminating pathogens is an important step, but the addiction may return unless one makes changes in diet, lifestyle and attitude, and faces any fears, traumas, or metabolic disorders that originally induced the drinking.

The 1986 journal article “Lithium orotate in the treatment of alcoholism and related conditions”¹¹ reported how lithium orotate—which is a mineral, unlike the drug lithium carbonate—was successfully used with very few undesirable effects. If you want to use more than 30 mg or 40 mg a day of this mineral, consult a health care provider versed in the use of lithium for therapeutic purposes.

Symptoms of alcohol poisoning are very similar to symptoms of an overgrowth of *Candida albicans* or other *Candida* strains. The fungi excrete acetaldehyde (a potent toxin chemically related to formaldehyde), which interferes with the body’s neurotransmitter pathways, metabolism, immune response, and nervous and endocrine systems. A craving for alcohol may indicate a *Candida* infection and vice-versa; so make sure to run the *Candida* frequencies under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

Alcoholism is a complex condition, so all of its roots must be addressed. Sauna therapy and other detoxification protocols could help. Also see “Meningitis” in this section (to manage the swelling in the brain that occurs with advanced alcoholism); **LYMPHATIC SYSTEM**, “Lymph System Circulation / Drainage, to Increase”; **URINARY TRACT**, **Kidneys**, “Kidney Function, to Balance and Normalize”; and, under **LIVER AND GALLBLADDER**, **Liver**, the “Hepatitis” entries and “Liver Function, to Support and Balance.” Alcoholism can cause (or reflect) hypoglycemia or diabetes, so also see **BLOOD SUGAR PROBLEMS**.

Hangover

Acute toxicity in the blood and lymph, resulting from alcohol ingestion. Symptoms include head and body aches, gastrointestinal disturbances, blunted motor responses, and malaise.

146, 522, 10K, 40K

Alzheimer’s Disease

A brain-related disorder usually affecting the elderly, featuring memory loss (first short-term and then long-term), difficulty in planning and solving problems, mental confusion, trouble understanding visual images and spatial relationships, problems speaking and understanding words, poor judgment, and mood and personality changes (including delusions, paranoia, and repetitive behaviors). Severely impaired individuals may require assistance with personal care and even feeding. In the final stages, muscles may become abnormally rigid or flaccid, and people cannot swallow or hold themselves up without support.

Alzheimer’s is characterized by distinctive markers. Amyloid plaques (also known as neuritic plaques or senile plaques)—which are toxic sticky proteins that accumulate outside of nerve cells—can both cause and indicate cognitive dysfunction. Pericytes, cells found near blood vessels, control the flow of blood to different parts of the brain by expanding and contracting. When they degenerate, or there’s an inadequate supply, nerve cells suffocate and malfunction due to the oxygen loss. Neurofibrillary tangles, toxic protein structures in the brain, are involved in neurological impairment as well.

Establishment medicine has no cure for Alzheimer’s, but holistic medicine understands the role of pathogens and environmental toxins. Many vaccines contain the poisonous mercury compound thimerosal and/or the toxic metal aluminum. Abnormally high levels of both

The Autonomic (Automatic, or Involuntary) Nervous System has two complementary branches.

Sympathetic Nervous System Psychological Components: Anxiety, Lack of Pleasure Physiological Component: Contraction	Parasympathetic Nervous System Psychological Components: Contentment, Pleasure Physiological Component: Expansion
Inactivity of salivary glands, producing a dry mouth—the mouth is “dry with fright.”	Activity of salivary glands, producing a moist mouth—a “mouth watering” situation.
The smooth muscle of the iris in the eye contracts, allowing the pupil to dilate and more light to enter the eye (so we are literally blinded by fear).	The smooth muscle of the iris in the eye relaxes, allowing the pupil to constrict and less light to enter the eye (so we literally see more clearly).
Inhibition of the lachrymal or tear glands, producing “dry eyes”—associated with depression.	Stimulation of the lachrymal or tear glands, producing moist, lubricated and glowing eyes—associated with joy.
Stimulation of the sweat glands in face and body so that the skin is moist; person feels “clammy and cold with fear.”	Reduction of activity of sweat glands in face and body so that skin is dry; person feels “cool, calm and collected.”
Reduction of digestive movement and secretion of digestive fluids—too anxiety-ridden to readily assimilate nourishment.	Increase of digestive movement and secretion of digestive fluids—being at ease fosters assimilation of nourishment.
Contraction of the arteries: blood flows away from surface of skin, producing a pallor and psychologically and physiologically indicating a coolness or coldness.	Dilation of the arteries: blood flows to surface of skin, producing a healthy glow and psychologically and physiologically indicating warmth.
Increased secretion of adrenal stress hormones, indicating fear and anxiety (fight-or-flight response).	Decreased secretion of adrenal stress hormones, indicating feelings of security and peace.
Scalp muscles are excited, so hair literally “stands on end.”	Scalp muscles are relaxed.
Calcium ion mineral group predominates.	Potassium ion mineral group predominates.
Increased secretion of acid fluids, which dehydrates the system and can lead to illness.	Increased secretion of alkaline fluids, which hydrates the system and stimulate good health.
Decreased susceptibility to electrical stimulation.	Increased susceptibility to electrical stimulation.
Increased need for oxygen and increased oxygen consumption.	Decreased need for oxygen and decreased oxygen consumption.
Increased blood pressure.	Decreased blood pressure.
Tightening of smooth musculature in male scrotum and female vagina, inhibition of glandular secretions, decrease of blood supply, reduction of sexual feeling.	Relaxation of smooth musculature in male scrotum and female vagina, stimulation of glandular secretions, increased blood supply, increase of sexual feeling.

Adapted from Wilhelm Reich's *The Function of the Orgasm* (1973), and from *Zeitschrift für Politische Psychologie und Sexualökonomie*, Vol. 1, 1934

aluminum and mercury have been discovered in the brains of people with Alzheimer's—who, not coincidentally, receive a disproportionate number of flu shots compared to the general population. These toxic metals contribute to the formation of amyloid plaques. Replace mercury amalgam fillings with porcelain or composite. Don't cook with aluminum pots. Consider a chelation protocol (pages 624–626) or sauna-niacin program (page 696) to bind and excrete toxic metals. Due to the involvement of heavy metals, see **CHEMICAL SENSITIVITY / POISONING**, “Mercury, Aluminum, and Other Contaminants.”

Another poison that contributes to Alzheimer's is fluoride. Known to calcify the pineal gland, fluoride prevents it from secreting the vital hormone melatonin. A calcified pineal, which literally contains crystals of calcium phosphate, typically appears as a lump of calcium during a magnetic resonance (MRI) scan. People with Alzheimer's are commonly deficient in melatonin. They are also observed to possess a higher degree of pineal gland calcification than people with other types of dementia.

Neurologist David Perlmutter states that Alzheimer's is preventable, and that (as with many neurological issues) it results from heavy consumption of sugars and carbohydrates. In 2005, scientists discovered that the brain produces and depends on insulin, which protects its cells from deteriorating. Amyloid-derived diffusible ligands, toxic proteins caused by inflammation, interfere with brain signals because they remove insulin receptors from the brain neurons. Sugar is a culprit, leading some researchers to call Alzheimer's “Type 3 Diabetes.” Eliminate glutinous grains (see Chapter 3, **Food**).

Nutrient deficiencies exist. Researchers found that a decrease in Alzheimer symptoms correlates with increased levels of magnesium in the brain. Magnesium-l-threonate is the form of this mineral that easily crosses the blood-brain barrier and nourishes the neural brain tissue. Try the mineral lithium orotate. Also, be aware that a Vitamin B12 deficiency can exactly mimic the symptoms of Alzheimer's. Sometimes, supplementing with Vitamin B12 alone reverses the symptoms.

The orange-gold root turmeric, used in Indian cooking for centuries, contains hundreds of compounds including curcumin. Curcumin blocks the formation of the amyloid plaques that cause Alzheimer's to develop, but it's the synergistic effect of the entire turmeric root that helps stimulate the growth and number of healthy neural stem cells. Not surprisingly, India has among the lowest rates of Alzheimer's and dementia of any country in the world.

Minimally processed coconut oil has also been found to protect against nerve damage and restore brain function to such an extent that it reverses the symptoms of people with Alzheimer's, Parkinson's, and other neurological disorders. Virgin olive oil, from the first pressing of olives, may also offer protection against Alzheimer's because it reduces inflammation in the brain, and helps break down toxins and remove them from the cells.

Dr. Lida Mattman found the Lyme spirochete in every person she treated for Alzheimer's. A twelve-year study done by Johns Hopkins, Duke, and Utah State Universities researchers found, in 2010, that husbands or wives who cared for spouses with dementia were six times more likely to develop dementia themselves. While a shared diet (and shared visits to the doctor for vaccinations) could play a role, in some cases Alzheimer's may be acquired—due to contagious pathogens or even prions, which researchers suspect also play a role in Parkinson's. Thus, for this condition, eliminate pathogens and prions. Also see, under **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease,” “*Mycoplasma*, many types,” and “*Treponema denticola*. Under **VIRUSES**, **Herpes**, **all types**, see “*Herpes simplex 1*,” “*Herpes Virus Type 5* (Human *Herpes Type 5*) / Cytomegalovirus (CMV) / Salivary Gland Virus,” and “*Herpes Virus Type 6* / Human *Herpes Type 6*.” Also see “*Candida albicans*” under **CANDIDA, FUNGI, MOLDS AND YEASTS**. And see **PRIONS / AMYLOIDOSIS** for more details, including information on how to remove them.

40, 430, 620, 624, 840, 866, 2213, 5148, 19180.5

Amyotrophic Lateral Sclerosis (ALS)

Sometimes also called Motor Neuron disease or Lou Gehrig's disease (after the baseball player who was afflicted with the condition). Degeneration of spinal cord in the form of hardening, thickening, and inflammation. Eventually it atrophies, and may lead to spastic paraplegia.

Research continues on the involvement of pathogens. In 1990, John J. Halperin, a medical doctor very experienced in neurological infections, reported that almost every person he ever treated for ALS tested positive for Lyme disease. Similarly, medical doctor Dietrich Klinghardt has reported that without exception, every person in his clinic with ALS (or Multiple Sclerosis or Parkinson's) has tested positive for Lyme. Therefore, see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease.” Yet another doctor reports that every person he treats for ALS has tested positive for the microorganism *Mycoplasma fermentans*. So, see “*Mycoplasma*, many types” under **BACTERIA**. Also see **VIRUSES**, “ECHO Virus / Enteric Cytopathic Human Orphan Virus / Nonpolio Enterovirus Infection,” as French researchers implicated this microorganism in a majority of ALS cases. Dr. Richard Loyd found toxoplasmosis in every case of ALS he's managed, so also see **PARASITES, PROTOZOA AND WORMS**, “*Toxoplasma gondii* / Toxoplasmosis.” Try “Multiple Sclerosis” and other entries in this section. Finally, mold toxins may be involved, so see **CANDIDA, FUNGI, MOLDS AND YEASTS**.

Some of these are from Michael Tigchelaar: 254, 303, 430, 470, 484, 610 + 692 + 980, 620, 624, 644, 660 + 690 + 727, 742.4, 790, 864, 866, 986, 1918, 2213, 2900 (for 5 minutes), 5148, 40K (for as long as desired)

Transcranial Direct Current Stimulation (tDCS)

Imagine inhibiting neural activity in portions of the brain that are too active (responsible for addictions, pain, and insomnia)—and facilitating brain activity in centers you wanted to improve (learning, creativity, memory). With very gentle electrodes placed on the scalp, you can do just that. See Appendices A and C.

Anger

When waste materials from microbes get into the brain, all kinds of emotional and physiological reactions can result. These frequencies are also useful for hostile dogs and cats. Also see other entries in this section.

3.6, 3.9, 6.3

Apoplexy

See “Stroke Paralysis / Apoplexy” in this section.

Arm Pain

See “Neuralgia, Brachial” in this section.

Asthma / Bronchial Asthma

Spasm or swelling of the bronchial tubes in lungs. There is often an emotional component to this symptom picture, as many people suffering from asthma harbor unresolved feelings, mostly grief and sadness. Avoid eating dairy, sugars, grains, citrus, excess red meat, and any other mucus-producing foods. Also try to avoid areas that are full of mold, mildew, and other pollutants.

0.5, 20, 72, 95, 125, 146, 444 + 1865, 522, 660 + 690 + 727, 787, 810, 880, 1233/1234, 1283, 1500, 1600, 1800, 2170, 2720

Astrocytoma

See “Brain Tumor / Astrocytoma” under **CANCER**.

Ataxia

Lack of muscle coordination. Results might be slow if nerve damage exists, but brain cells can regenerate, so keep trying.

20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 807, 813, 880, 1500, 1600, 1800, 2170, 2720, 40K

Ataxia, Spastic

See “Spastic Ataxia” in this section.

Attention Deficit Disorder (ADD) / Attention Deficit Hyperactivity Disorder (ADHD)

This diagnosis has become a political issue. If children are restless because they are bored in school, officials have an excuse to label them with an unfavorable mental health diagnosis, and then fill them with poisonous drugs.

If the child is genuinely hyperkinetic and unfocused, and you are sure that there is no sexual abuse or other trauma, eliminate food additives including the artificial sweetener aspartame, and allergenic substances such as wheat, processed dairy, soy, and other irritants (a good idea anyway). Newer research shows abnormally low levels of iron in ADD children, indicating poor absorption. There may also be low levels of B12 and methylfolate (see Chapter 3, **Nutritional Supplements**, about conversion problems), Vitamin C, and digestive enzymes—all of which help with iron absorption. Also check for a displacement of the atlas, the highest bone in the spine, just below the occiput (back of the head). When the atlas is displaced, the resulting pinched nerves cut off enough energy flow to help produce the varied and often bizarre symptoms that the medical field characterizes as ADD.

Prozac® and other drugs given to hyperactive children often cause the very symptoms they purportedly alleviate, so there's no excuse for drugging children (or adults, either). No one ever became ill from a Prozac® deficiency. Essential oils containing large amounts of sesquiterpenes—sandalwood, rosewood and chamomile—offer great benefits when rubbed on the skin. The frequencies below are experimental. Also see “*Shigella*” and the “*Chlamydia*” entries under **BACTERIA**; and various entries under **CHEMICAL SENSITIVITY / POISONING**.

3 + 230 (also used for insomnia), 470, 471.5, 621, 762, 769, 770, 802 + 1550, 940.1, 942.9, 1880.1, 1885.9, 3760.1, 3760.3, 3771.7, 7520.5, 7543.4, 15125832

Autism

A broad spectrum of behavioral, mental, and emotional dysfunctions beginning in childhood. Symptoms can include poor communications skills (using gestures or pointing instead of words); inappropriate verbal response (either lack of speaking, or repeating words or phrases in place of normal, responsive language); poor motor dexterity; sudden laughing or crying; social and emotional aloofness; tantrums; aversion to being touched; poor or no eye contact; inability to understand or fear danger; overactivity (spinning and twirling, of self and objects); underactivity; an obsessive preoccupation with inanimate objects; and resistance to change. Autism now strikes 1 in 68 children, of whom about two-thirds are boys.

High numbers of normal children become autistic after being given injections—particularly if vaccines contain more than one pathogen and/or the mercury-based preservative thimerosal. A negative reaction can occur in 24 hours or could take several months.

Mercury is much more difficult to expel when injected than eaten. By 15 months old, most children have been injected with over 200 times the EPA-approved “safe” levels of mercury (thimerosal) as well as aluminum. These metals, along with pathogens and chemicals (also in vaccines), were never meant to be injected into veins (see Chapter 1, **The Vaccine Controversy**). The

metals collect in brain and nerve tissue. Stealth viruses have also been found by some researchers in the blood, cerebrospinal fluid, and gastrointestinal biopsy samples in the majority of autistic children. This suggests that at least some cases of autism are caused by a stealth virus infection in the brain.

Nutritional deficiencies such as magnesium, or food triggers such as wheat and dairy, can play a huge role in autism. Autistic children put on a casein-free and gluten-free diet usually improve because the casein in dairy, and the gluten in wheat and other grains, are highly allergenic. When an allergy is present, the body often lacks enzymes to break down food. This allows incompletely digested particles to circulate in the bloodstream and irritate the tissues. Other proteins may also be present to which the body reacts negatively: it's common for unmetabolized substances to reach areas in the brain involved with learning and speech, and latch on to the brain's naturally-occurring opiate receptors. This causes symptoms similar to those of being drugged. Autism can also be caused or exacerbated by preservatives and food dyes along with foods. Remove wheat, all dairy (commercial or raw), soy, food colorings, preservatives, chemical poisons, and known or suspected food allergens from the diet.

Autistic children lack sufficient beneficial intestinal flora (sometimes due to antibiotics, which destroy the flora). When the friendly gut flora is reduced, harmful bacteria proliferate and migrate to the brain. This can cause "brain poisoning" that manifests as autism. Supplementation with probiotics usually produces profound and positive changes because a disturbed, malfunctioning gut equals a disturbed, malfunctioning mind. Also try the mineral lithium orotate (see the beginning of this main category).

Another contributing factor to autism may be emotional trauma such as sexual abuse. If there's obvious psychological distress and trauma, take the child to an experienced psychotherapist who specializes in trauma. If it's not clear whether the causes are biochemical or emotional, begin therapy from a biochemical standpoint and then you'll more easily see what's left to treat. An experienced naturopath, homeopath or other holistic practitioner may make the difference between suffering and wellness for your child.

In many cases, parents are forced to vaccinate and they don't have legal standing to sue drug companies or doctors if the child becomes ill. Try chelation and sauna therapy, a simple and effective way to eliminate heavy metals and other toxins. See my book, *The Holistic Handbook of Sauna Therapy*, for more information. Also, don't be afraid to try MMS (sodium chlorite); its negative press is undeserved. With oxidative properties similar to ozone and hydrogen peroxide, MMS kills pathogens and neutralizes poisons, both of which have proven connections to autism. Get Jim Humble's *MMS Health Recovery Guidebook* or see

kerririvera.com. Kerri, the mother of a formerly autistic child, has helped hundreds of children with her protocol.

See **BACTERIA**, "*Clostridium difficile*," as this microbe emits toxins that can manifest as schizophrenia. Also see, under **BACTERIA**, the "*Shigella*" and "*Chlamydia*" entries and "*Borrelia*, all types / Borreliosis / Lyme Disease." See **CHEMICAL SENSITIVITY / POISONING**; and "Attention Deficit Disorder (ADD) / Attention Deficit Hyperactivity Disorder (ADHD)" in this section. Autistic children are loaded with parasites, so also see applicable entries under **PARASITES, PROTOZOA AND WORMS**, including "*Funis vermis* / *Homo Funis vermis* / Ropeworm," an unusual parasite that was recently discovered in autistic people.

Back Pain, to Reduce

See **BONE AND SKELETON**, "Back Pain, to Reduce."

Bed Wetting / Enuresis

Surprisingly large numbers of children wet their beds due to diet. Major allergens include citrus, corn, tomato, soy, and adulterated (homogenized and pasteurized) dairy products. Spices, food colorings, and caffeine (found in both coffee and chocolate, a child's favorite) are also irritants. Children may also wet their beds if they feel frightened or neglected. Toilet training at too early an age or sexual abuse are common causes—either of which (the emotional component aside) provides a breeding ground for microbes. With adult incontinence, the same microorganisms are implicated. Bed wetting can also be caused by a parasite infestation, so see "*Enterobius vermicularis* / Pinworm / Seatworm" under **PARASITES, PROTOZOA AND WORMS**; or under **GASTROINTESTINAL TRACT, Small Intestine**.

Run for 10 minutes each: 465, 660 + 690 + 727, 787, 802 + 1550, 880, 2050, 2128, 2250, 10K, 40K

Bell's Palsy

Partial or complete paralysis of the face, often caused by an inflammation or infection in the seventh cranial nerve. This causes droopy mouth, an eyelid that might not close, numbness, and muscle spasms and heaviness. Many pathogens could be involved. The condition often goes away by itself, but if it's caused by dangerous pathogens—such as those involved in Lyme and similar diseases—it could be permanent. Each frequency below is for 3 minutes minimum; try them every day for several weeks. Also see viruses, "*Herpes Virus Type 3* / *Herpes zoster* / Chicken Pox / *Varicella* / Shingles." Because Bell's Palsy can be caused by either the spirochete involved in Lyme disease or especially black mold, also see **BACTERIA**, "*Borrelia*, all types / Borreliosis / Lyme Disease" **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Aspergillus niger*."

2.4, 3, 3.9, 7.83, 20, 27.5 + 220 + 410, 33, 35, 40, 93.5, 470.5, 570.5, 72, 90.88, 110, 125, 194, 222, 304, 393.5, 464, 565.5, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 833, 880, 1250, 40K

Bipolar Disorder / Manic Depression

Bipolar disorder is also called “manic depression” because a person’s mood can alternate between a mania high and a depressive low. Mood swings can last hours, days, or longer. Symptoms are characterized by extreme changes of cognition, energy, and behavior. The high, manic end may include increased physical and mental activity; feelings of exaggerated optimism and self-confidence; a decreased need for sleep; an inflated sense of grandiosity; aggressiveness; irritability; racing speech, thought and movement; impulsive and reckless behavior; poor judgment; and distractibility, delusions, and hallucinations. The low, depressive end may include prolonged sadness and depression; crying spells; agitation and anxiety; anger; worry; pessimism; indifference; marked changes in sleeping and eating; fatigue and lethargy; difficulty concentrating; social withdrawal; feelings of guilt and worthlessness; aches and pains; and recurring thoughts of suicide and death. People on manic episodes are known to spend money they don’t have, talk fast, and engage in high-energy projects and high-risk, dangerous behavior. This disorder is different from “regular” depression because there is always a manic episode. Some people have more manic episodes than others.

Bipolar disorder is thought to affect over two million adult Americans. It begins in late adolescence (often

appearing as depression) and affects equal numbers of men and women. It appears to be found among all ages, races, ethnic groups, and social classes. It may run in families.

This condition is real, even though the diagnosis is made by medical personnel eager to treat with drugs. However, the fact that nutritional and herbal supplements are used successfully indicates that the biochemical imbalances in the brain are nutrient-based. (As holistic practitioners are fond of saying, no one is born with a Prozac® deficiency.) Omega 3 fatty acids (which include eicosapentaenoic acid or EPA, and docosahexaenoic acid or DHA) improve heart health, immune function, and in many cases, depression and cognitive abilities. They are in shellfish, sardines, albacore tuna, salmon, flaxseed, and walnuts. Two herbal supplements used for depression are St. John’s wort (*Hypericum perforatum*) and S-Adenosyl-L-Methionine (SAM-e). St. John’s wort is believed to prevent nerve cells in the brain from reabsorbing the brain chemical serotonin, thus relieving depression. SAM-e, which is concentrated in the liver and brain, plays a vital role in regulating serotonin and dopamine, two chemicals that influence mood. Both supplements are widely used in Europe to treat arthritis and depression. Also try the mineral lithium orotate; see the beginning of this section for details. Finally, a magnesium deficiency may exist.

The parasite *Toxoplasma gondii* has also been strongly linked to schizophrenia and bipolar disorder. In the latter

Underappreciated Amino Acids

Almost all people with health issues have one thing in common: some degree of digestive failure. One result is that there is a lack of free amino acids. Even if people eat steak three times a day, there is protein starvation at the cellular level because only partially digested proteins in the form of amino acid clumps are absorbed into the blood, rendering those proteins useless. Imagine a bricklayer who is hired to build a brick wall. He arrives at the site. The truckload of bricks arrives. He reaches into the truck and pulls out a brick only to find that another five or six bricks are stuck to it with ends sticking out in all directions. He pulls a second brick and discovers another useless clump.

This is what the body faces. It needs to make thousands of metabolic enzymes and other necessary chemicals, but does not have the raw materials. It cannot get them from food because the digestion is not efficient enough. Even supplementation of stomach acid and enzymes usually does not enable the body to make enough free amino acids.

One compound that is necessary for health in a polluted world is metallothionein. The body uses metallothionein to carry away mercury and other toxic metals. But the body cannot make this material if there is a shortage of free amino acids. Researchers find deficiency of metallothionein production in cancer and in all or nearly all cases of autism. I suspect it will be found in many other conditions.

The body also needs free amino acids to make neurotransmitters. I am hearing reports from people recovering from depression and anxiety while using amino acids. The immune system also needs free amino acids.

Fibromyalgia is another condition where there is an amino acid deficiency. Other conditions that involve a lack of free amino acids include skin wrinkling, thinning of hair, and weak fingernails, along with more serious conditions such as digestive failure, irritable bowel, chronic fatigue, spinal disk degeneration, joint degeneration, osteoporosis, pain, stiffness, infections, and stress to every tissue in the body.

Amino acids are food. They are not medication and they do not “cure” anything. They do not make anything happen. They simply provide raw materials to the body. When combined with vitamins, minerals (especially sulfur) and essential fatty acids, they just help people move toward health. I believe that amino acid supplementation is the fastest and safest method of heavy metal removal.

—adapted from Richard Loyd, PhD, 2016
royalrife.com/amino.html

part of the 1800's, when house cat ownership became popular, these conditions, which had been almost non-existent, became fairly common. This parasite is carried by house cats and expelled through their feces. The affected house cats then jump from the contaminated litter boxes and walk over furniture and food preparation surfaces. In humans, this parasite causes brain lesions, changes in personality, and symptoms of psychosis, including auditory hallucinations and delusions.

See **PARASITES, PROTOZOA AND WORMS**, "*Toxoplasma gondii* / Toxoplasmosis." See, under **BACTERIA**, "*Borrelia*, all types / Borreliosis / Lyme Disease" and the "*Strep*" entries. See, under **VIRUSES**, "Borna Virus / Borna Disease Virus (BDV)," "*Herpes Virus Type 5* (Human *Herpes* Type 5) / Cytomegalovirus (CMV) / Salivary Gland Virus," and "Retrovirus, variants," as studies show a strong link between these microbes and mental illness. Especially in children, abrupt onset of Obsessive-Compulsive Disorder (OCD) is linked to *Strep* infection. For 5 minutes each: 802, 263.1, 304, 6K, 6130.

Brachial Neuralgia

See "Neuralgia, Brachial" in this section.

Brain Damage

This is a large category with many possible causes. Dr. Robert Vink (see References) found that in many cases of mild to moderate brain damage, magnesium can correct structural malformations of the neurons and hence resolve symptoms. For some types of brain injury (including acute-onset injury), the blood brain barrier prevents the mineral from reaching the structures that most need it. However, this can be remedied by taking magnesium in a different form: magnesium-l-threonate, which crosses the blood-brain barrier and penetrates the brain tissue.

For more information on the restoration of brain cells. see "Alzheimer's Disease" in this section. Also investigate specialized bodywork and CranioSacral Therapy (see **Chapter 3**) to release pressure inside the brain and realign its structures.

Brain Fungus

See "*Gliocladium* / Brain Fungus" in this section.

Brain Tumor

See under **CANCER**.

Calming, to Produce

2.5, 10, 7.83, 80, 304, 6K

Cerebral Palsy

146, 522, 660 + 690 + 727, 787, 880, 1K, 40K

Cerebrospinal Conditions

10K, 40K

Colitis

Inflammation of the colon. It usually has an emotional component. Meditation, stress reduction techniques, and psychotherapy can help to help discharge or release anger and other emotions. The majority of "brain" biochemicals are in the gut, so consider taking the mineral lithium orotate (not the drug lithium carbonate as they are very different; see the beginning of this entire section for details). Also see "Colitis / Ulcerative Colitis / Irritable Bowel Syndrome (IBS)" under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

Concentration and Clarity, to Improve

It's wise to know what pathogen you're dealing with, especially because microbial waste can pass the blood brain barrier and cause mental and emotional symptoms. Any harmful microbe that spews waste into the tissues and bloodstream can contribute to "brain fog." Try the herb *Ginkgo biloba*, which augments blood flow to the brain and body, and increases the body's production of adenosine triphosphate (ATP), the main source of energy for the cells. This will help the brain metabolize glucose and increase its electrical activity.

Check for food allergies, particularly to adulterated dairy, wheat, soy, and corn. Eliminate artificial chemicals, dyes, and preservatives from the diet. Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Candida albicans*"; the many entries under **PARASITES, PROTOZOA AND WORMS**; and see "Study Mode" in this section.

5.8, 7.83, 20, 35, 10K, 40K

Convulsions

Sudden, involuntary movements of the musculature. Also see "Epilepsy" in this section. Seek medical advice!

660 + 690 + 727, 787, 880, 10K, 40K

With spasticity: 7.69, 8.25, 9.19, 9.2

Dementia

See "Alzheimer's Disease" in this section.

Depression

Depression can be caused by the toxic wastes excreted by pathogens. However, a June 2018 study—"Prevalence of Prescription Medications With Depression as a Potential Adverse Effect Among Adults in the United States"—showed that depression can also be caused by hundreds of drugs that are not antidepressants: over-the-counter antacids, prescription and non-prescription painkillers (including ibuprofen), contraceptives, blood pressure and heart medications, and more!¹² The report coincided with newly released statistics showing that suicides rose by 30% in the past two decades, half of which were from people not known to suffer from depression or mental illness. If

you are taking any drugs, get professional help to find safe substitutes. Also see the beginning of this main category for details on the mineral lithium orotate. Recent research indicates that an Acetyl-L-Carnitine deficiency can cause depression as well; it plays a crucial role in metabolizing fat and producing energy. It's available as a supplement.

People with infectious mononucleosis or Chronic Fatigue (caused by the Epstein-Barr virus) have four times the risk of developing clinical depression, so see **VIRUSES**, "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)." See, under **PARASITES, PROTOZOA AND WORMS**, "Tapeworm," because depression and psychotic symptoms can develop when a tapeworm invades the brain, leaves cysts (larval sacs), and causes lesions, cerebral swelling, and encephalitis. Also see **PARASITES, PROTOZOA AND WORMS**, "*Toxoplasma gondii* / Toxoplasmosis," as these toxins can contribute to suicidal depression. Also see the numerous *Candida* frequencies under **CANDIDA, FUNGI, MOLDS AND YEASTS**, as the potent toxins released by various strains of *Candida* negatively affect the brain and nervous system. See other entries in this section. Also see **BLOOD SUGAR PROBLEMS** and **GLANDS, Thyroid**, as both of these conditions can also cause severe depression.

Anxiety, Trembling and Weakness

30.5, 800

Drug or Toxin related

1.1 + 73, 30.5

Shigella flexneri related

Accounts for just under one-third of the cases of *Shigella* infection in the US, and is linked to depression. Can also lead to a chronic condition called reactive arthritis, symptoms of which include joint pain, painful urination, and eye irritation.

From Dr. Hulda Clark: 394K or 976.63 Hz (for units unable to reach the KHz range) and 19616.10

Down's Syndrome

A condition of stunted growth and limited mental ability corresponding to a chromosomal abnormality. Physical characteristics make all Down Syndrome people look similar: a broad nose, slanted eyes, and flat skull. Nutritionally-oriented biochemists have discovered that Down's babies have metabolic imbalances that lead to deficiencies of some nutrients (such as zinc and selenium), excesses in others, malabsorption of essential fatty acids (EFAs) and other nutrients, dangerously high levels of some toxic metals, and digestive disturbances.

During his lifetime (1903–1992), genetic disease

physician Henry Turkel was well known for the medical instruments he invented, cited in over a thousand scientific publications. He developed what he called the "U-series" treatment: administering extra large amounts of vitamins, minerals and enzymes in which his clients were deficient, tailored to their individual needs. He began treating Down's Syndrome babies and children with the same protocol, often adding medications such as thyroid hormone. The physical anomalies that accompanied the mental limitations—characteristic markers of the Down Syndrome defect—would all lessen or even disappear. Almost without exception, he reported, these people were able to live normal lives; in fact, many graduated college. Dr. Turkel's 1985 book, *Medical Treatment of Down Syndrome and Genetic Diseases*, is still available today. The Japanese government awarded Turkel a medal in 1974. In the United States, the FDA made it illegal for him to ship his supplements across state lines.

See a holistic doctor who's skilled in nutrition. This condition has been known to correct itself in a fair number of cases if it's addressed early enough with very high amounts of the right nutrients, which include probiotics. Also see various entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and under **GASTROINTESTINAL TRACT**.

20, 5K, 40K

Dyslexia

There are no known frequencies for dyslexia, so see "Attention Deficit Disorder (ADD) / Attention Deficit Hyperactivity Disorder (ADHD)" in this section. Also see Appendix A, Color Therapy, "Irlen," for information about special colored transparent overlays that help correct the brain's visual processing centers while improving reading.

Eating Disorders

This is generally perceived as a discrete disease entity. An increasing number of people, particularly women and girls—an estimated 5% or more, some as young as seven years old—suffer from a poor relationship with food. This manifests in binge-eating followed by vomiting (bulimia), as well as excessive fasting, inappropriate use of laxatives and diuretics, or compulsive exercising as a form of weight control. Sometimes, there may be self-starvation (anorexia). The health impact of bingeing and purging is severe. Loss of minerals can lead to irregular heartbeat. The acid from frequent vomiting can burn the esophagus and corrode the enamel on teeth. Dehydration and gastrointestinal problems are almost guaranteed.

Negative body image is reinforced by our superficial culture. It associates self-worth with a certain appearance, and has a deeply entrenched view of women as objects. Pressure to look like a movie star (an impossible ideal) is so pervasive that now men and boys are developing eating disorders too. In many cases, eating disorders are rooted in emotional and sexual abuse.

In addition to their emotional and social components, eating disorders can relate to faulty metabolism, incomplete absorption and assimilation of nutrients, and chemical poisoning that damages certain areas of the brain. Abnormal neurotransmitter levels will likely be found. The thyroid gland, which regulates metabolism and thus weight loss or gain, may be malfunctioning. The pituitary gland may also be implicated because it regulates the thyroid. Blood sugar disorders (hypoglycemia and diabetes) also relate to metabolic function.

A malfunctioning metabolism, poor nutrient utilization, the inability to efficiently eliminate toxins, and waste accumulation all contribute to the proliferation of pathogens. *Candida*, worms, and parasites are suspect in all cases of eating disorders. They feed on junk foods and sugars that people tend to eat in excess. They cause perpetual hunger because nutrients are being diverted to feed them. And wastes excreted by pathogens accumulate in the body, causing toxicity. Therefore, the existence of microorganisms may support, accompany, and even cause this imbalance. *Candida* and parasites feed on heavy metals, so it's worth checking for mercury, aluminum, cadmium, and other toxic metals.

In *The Diet Cure*, Julia Ross discusses eating disorders in relationship to a starving body, and recommends specific nutrients to help the body and brain heal. Amino acids to balance neurotransmitters are especially important (see Sidebar on page 656, "Underappreciated Amino Acids," and Chapter 1, page 65). A nutritionist versed in brain function can help correct the amino acid deficiencies that prevent the proper production and utilization of neurotransmitters.

For any issue involving a toxified system, sluggish metabolism, or faulty digestion, try a detox diet and sauna therapy. See Chapter 3, **Detoxification**.

See obesity / overweight. Other listings that may relate to your particular situation are **BLOOD SUGAR PROBLEMS**; **CANDIDA, FUNGI, MOLDS AND YEASTS**; **CHEMICAL SENSITIVITY / POISONING**; **GASTROINTESTINAL TRACT**; **GLANDS**, *Thyroid*; and **LIVER AND GALLBLADDER**.

Energy and Vitality, to Improve
40K

Enuresis

See "Bed Wetting / Enuresis" in this section.

Epilepsy

Brain disorder in which its neurons emit more electricity than they should, characterized by convulsions and loss of consciousness. Brain lesions, epileptic seizures, and symptoms similar to Multiple Sclerosis, Parkinson's, and other nerve conditions can be caused by pathogens or by the ingestion or inhalation of toxic metals, petrochemicals, artificial sweeteners, and some pharmaceuticals.

A high fat or ketogenic diet, originally developed at Johns Hopkins and the Mayo Clinic in the 1920s, stops seizures. Most allopathic doctors say they don't know why it works, but we can make an educated guess. Healthy neurons are insulated by fatty sheaths. Without insulation, electrical messages are scrambled. It makes sense that if a high-fat diet eliminates symptoms, a shortage of healthy fats is a primary cause of at least some cases of epilepsy. Also see **CHEMICAL SENSITIVITY / POISONING**, "Mercury, Aluminum, and Other Contaminants"; and "Seizure" and other entries in this section.

From Dr. Marty Monahan: 20, 600, 650, 700, 727, 787, 802

Also try: 21, 125, 210, 625, 633, 660, 690, 880, 1550, 40K (use this last one for as long as you want)

Fear

Wastes from pathogens that seep into the brain induce all kinds of emotional and physiological reactions. Also see various entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and **PARASITES, PROTOZOA AND WORMS**.

1.1 + 73, 5.8

Gliocladium / Brain Fungus

855 (from Dr. John Garvey), 469, 633

Hallucinations

20, 660 + 690 + 727, 787, 880, 40K

Hangover

See "Alcoholism" in this section.

Headache

See **HEADACHE**. Also see "Migraine" in this section.

Herpes zoster

See "Shingles" in this section.

Hives / Urticaria

Sometimes bumps break out on the skin due to anxiety, nervousness or trauma. See under **SKIN**.

Hypoglycemia

See under **BLOOD SUGAR PROBLEMS**.

Hypothalamus, to Balance and Normalize

15.42, 537, 1351, 1413, 1534

For improved cognitive function, sleep, motor coordination, addiction control, pain reduction, neurological balance, creativity, and to reduce anxiety and depression, try...

Transcranial Direct Current Stimulation

(see Appendices A and C)

Impotence and Frigidity, many types

See “Sexual Function” under **MEN** or **WOMEN**.

Infections, Post-operative (after shunt implants)

See **BACTERIA**, “*Propionibacterium acnes*,” as this microbe has been implicated in post-surgical infections of heart valves and central nervous system shunts.

Insomnia

Can be caused by eating late at night; exercising late in the day or evening; light in the bedroom; heavy metals (which irritate the nervous system); watching TV or using a computer or cell phone just before bedtime; or worry and anxiety. Severe trauma and abuse keep the system in a fight-or-flight, hypervigilant mode.

If you use melatonin, too much can cause nightmares and sleeplessness. Begin with 0.5 mg or less. For details, see Chapter 1, **Sleep and Rest**.

See **SCHUMANN RESONANCES** and **CHEMICAL SENSITIVITY / POISONING**. There may be an infection in the pituitary, pineal or brain; so see entries for relevant pathogens. Also see other listings in this section.

3 + 230, 3.9, 3.59, 3.6, 7.83, 10, 304, 800, 802 + 1550, 880, 1500, 6K, 40K

Intercostal Neuralgia

See “Neuralgia, Intercostal” in this section.

Intelligence and Clarity of Thought, to Improve

See “Concentration and Clarity, to Improve” in this section.

Irritability and Whining

Two of the frequencies are also used for inflammation. It is said that people’s emotions are “inflamed” when they’re in a bad mood.

3.6, 3.9, 6.3

Irritable Bowel Syndrome

See “Colitis” in this section.

Languorous (Non-Spastic) Paralysis

Muscular rigidity accompanying partial paralysis. In some cases, progress might be slow.

8.25, 9.19, 9.2, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 10K, 40K

Leukoencephalitis

Progressive inflammation, usually in young children, of the brain’s white matter. Also see “Encephalitis” in this section.

324, 338, 572, 712, 713, 715, 776, 783, 932, 934, 1035, 1079, 1111, 1160, 1244, 1333, 1630

Listeriosis

See “*Listeria monocytogenes* / Listeriosis” under **BACTERIA**.

Manic Depression

See “Bipolar Disorder / Manic Depression” in this section.

Memory, to Improve

Beta waves, which naturally range from about 13–40 Hz, can promote concentration and active thought, but they can also stimulate anxiety. Use frequencies at your own risk!

14.6, 14.7

Meningioma

Slow growing benign tumor of the meninges, the membranes enveloping the brain and spinal cord. Also see “Meningitis” in this section.

446, 535, 537

Meningitis

Inflammation of the membranes of spinal cord or brain. There are many microorganisms that could cause meningitis; only a few are below. Find the pathogen involved and rife specifically for that microorganism.

From Dr. John Garvey: 322, 822, 1044, 1422

Also try: 20, 72, 95, 125, 130, 254, 423, 444 + 1865, 428, 464, 484, 507, 517, 610 + 692 + 980, 660 + 690 + 727, 644, 676, 677, 706.7, 733, 764, 790, 787, 802 + 1550, 832, 864, 878.2, 880.2, 986, 2900

Sweep: 5044–5061; 5355–5458

***Coccidioides immitis* cause**

See **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Coccidioides immitis* / Valley Fever / Coccidioidomycosis / Coccidiosis.”

ECHO virus cause

461, 514, 600 + 625 + 650, 620, 722, 765, 788, 922

Enterococcus faecium

343, 686

***Meningococcus virus* cause**

720

Meningoencephalitis

Caused by *Cryptococcus neoformans*, a yeast that infects the respiratory tract but can then enter the brain and cause infection. Symptoms include headache, nausea, staggering gait, irritability, confusion, and blurred vision.

588, 636 (both from Dr. Richard Loyd), 367, 428, 444 + 1865, 476, 478, 522, 579, 594, 597, 613, 624, 785, 792, 872, 2121, 5880, 5884

Migraine

Pain at side of the head, often along the 5th cranial nerve, accompanied by disordered vision, nausea, chill, and fatigue. Migraines may be caused by allergies, drugs, chemicals, unsuitable food, a toxified liver, menstrual difficulties, hormonal conditions, worry, or even strenuous exercise.

Often, migraines can be caused by low blood sugar. The brain, although small compared to the rest of the body, utilizes 25% of the body's glucose at any given time. As little as a 5% drop in blood sugar can cause fatigue and adversely affect thinking, mood, and motor coordination. If blood glucose levels decrease, the body compensates by increasing the blood volume so that more glucose is brought to the brain. Blood volume is increased by expanding the blood vessels, thus increasing blood flow. Over time, the bulging blood vessels repeatedly pressing on nerves can cause pain. Another common cause for migraines is liver toxicity; so consider liver support and cleanses. See **LIVER AND GALLBLADDER**, *Liver*.

Avoid caffeine and other drugs, fake foods, and overly fatty foods. Rest in a dark room. Alkaline, mineralized water may help. Check for a probable magnesium deficiency and consider taking the mineral lithium orotate.

Also see **HEADACHE**, "General (unspecified)" and "*Strongyloides stercoralis* / Threadworm" under **PARASITES, PROTOZOA AND WORMS**; and **BLOOD SUGAR PROBLEMS**.

Motor Neuron Disease

See "Amyotrophic Lateral Sclerosis (ALS)" in this section.

Multiple Sclerosis (MS)

Lesions on the spinal cord and the brain that slowly disintegrate the fatty covering from the nerve cells, resulting in various degenerative symptoms such as loss of motor function, weakness, impaired vision, bladder dysfunction, and perceptual difficulties. Some people with this gradually debilitating condition experience partial remission, while others may eventually need a wheelchair.

A trigger is needed to cause MS. Brain lesions, epileptic seizures, and symptoms similar to MS, Parkinson's, and other nervous system conditions can be caused by the ingestion or inhalation of the toxic metals mercury and lead, and the petrochemicals benzene and toluene. These heavy metals and toxic chemicals appear in solvents, cleaners, paints, cosmetics, and vaccines. The artificial sweetener aspartame, common in diet soda and junk food, is a major factor in many MS cases. One common denominator of all these poisons is their ability to cross the blood brain barrier and directly affect the nervous system.

Medical researchers have found evidence of *Chlamydia pneumoniae* in the spinal fluid of 90% of people with MS who were tested; so see "*Chlamydia pneumoniae*" and "*Chlamydia trachomatis*" entries under **BACTERIA**. Other pathogens found in the majority of MS sufferers are *Brucella* and *Mycoplasma*, so see **BACTERIA**, "*Brucella*, all types" and "*Mycoplasma*." Another pathogen implicated in

Unstress the "Stress" Points Above the Eyes: Alleviate Trauma Using Either Your Hands or a Red Wavelength LED

Physiology. Above each eye, about halfway up the forehead, is an acupuncture / acupressure point, lying on a meridian, which correlates to the right and left hemispheres of the brain. When stressed, these points—and the meridians on which they lie—become unbalanced. This imbalance means that some portions of the brain (and the rest of the body) have too little energy, while other areas have too much energy. The imbalance also means that the right and left hemispheres of the brain are no longer communicating well with each other, if at all.

These points can be used to manage, or eliminate entirely, stress, anxiety, and even panic. There are two self-help ways to do this.

Method #1. This method is sometimes used by chiropractors and other bodyworkers. Place the fingers of both hands in a straight line across the forehead, making sure to cover these points, and gently breathe.

Method #2. This method requires a red LED whose wavelength lies somewhere between about 635 nm and 660 nm. Ideally, the LED should be equipped with a setting (often called "pulse") that allows it to flicker on and off rapidly at a rate too fast for the eye to see.

With the eyes closed, move the LED horizontally back and forth across the forehead while thinking of the person, situation, or event that originally caused you stress. If you don't know where the discomfort came from, focus on your unpleasant emotions and the bodily sensations that arise from the emotions.

The flickering ("pulsing") LED rebalances the meridians, integrates the right and left hemispheres of the brain, and relaxes the body—thus lessening or even neutralizing the stress. Beneficial changes from this session usually occur within an hour. Sometimes the initial stress is cleared but then releases a deeper level of stress, much like unpeeling an onion produces deeper layers. If this occurs, repeat the session. You may need to repeat it periodically.

This method is reminiscent of, but unaffiliated with, EMDR (Eye Movement Desensitization and Reprocessing). Developed by Dr. Francine Shapiro of the EMDR Institute, Inc.[™], EMDR was designed to help people quickly process and overcome the negative effects of trauma. Formal EMDR sessions must be administered by a trained professional. However, for those who are psychologically able to work on themselves, these methods can be empowering and healing.

MS is the Epstein-Barr Virus (EBV). More MS sufferers than non-MS people harbor the epsilon toxin, which is produced by the bacterium *Clostridium perfringens* and causes intense abdominal cramps and diarrhea. There are five strains of this bacterium. See some *Clostridium* entries under **BACTERIA**, and go to dnafrequencies.com for others. UK researchers found that Epstein-Barr can mimic symptoms of MS. It hides in the immune cells and releases chemicals that cause inflammation; so see **VIRUSES**, “Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS).”

Dr. Lida Mattman and others found the Lyme spirochete in many people who are mistakenly diagnosed with MS. Dr. Dietrich Klinghardt reported that without exception, everyone he treated who had Multiple Sclerosis (or Amyotrophic Lateral Sclerosis or Parkinson's) tested positive for Lyme disease; so see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease.”

Also see “Fluke” entries under **PARASITES, PROTOZOA AND WORMS**; *Herpes* entries under **VIRUSES**; and **CHEMICAL SENSITIVITY / POISONING**, “Mercury, Aluminum, and Other Contaminants.”

Recovery is possible. An optimistic outlook will help with healing. Sweep the frequencies 4 Hz on either side of the main signal.

20, 80.9, 143, 166, 218, 224, 235, 241.68, 253, 275, 304.6, 317, 421, 430, 464, 470, 524, 620, 624, 660 + 690 + 727, 784, 787, 802 + 1550, 840, 854, 880, 1331, 1875, 1883, 2088.59, 2189, 2213, 2252.8, 2466.9, 2720, 3056.9, 3767, 4992, 5K (for 30 minutes), 23570.5, 40K (for as long as desired)

One woman who completely cured herself of MS set her rife unit to sweep 4 on either side of the main signal, for each of the following frequencies: 20, 80.9, 241.68, 304.6, 660 + 690 + 727, 787, 880, 2088.59, 2252.8, 2357.5, 2466.9, 3056.9, 5K

Twitch

First try: 470

Also try: 143, 275, 430, 464, 524, 620, 624, 784, 840, 854, 2213

Nervousness and agitation, the inability to remain seated

See “Akathisia / Agitation” in this section.

Nerve Pain

968 (for 15 to 20 minutes, twice a day), 2720

Nerves, to Stimulate Healing of

2.0, 657, 10K, 5K, 40K

Nervous System, to Balance, Strengthen and Support

764, 40K

Nervousness

See “Akathisia / Agitation” in this section.

Neuralgia, Brachial

Nerve pain in the arm.

0.5, 3.9, 2720

Neuralgia, General

Severe pain along a nerve. This is considered a “shortened treatment.”

833 (from Dr. Garvey), 3.9, 802 + 1550, 2720, 10K, 40K

Neuralgia, Intercostal

Pain in rib musculature.

20, 125, 444 + 1865, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 2720, 3K, 40K

Neuralgia, Trigeminal

Inflammation of the trigeminal (5th cranial nerve), which regulates chewing and sensation in the face.

3.9, 70.5, 7.83, 27.5 + 220 + 410, 146, 428, 600 + 625 + 650, 660 + 690 + 727, 760, 776, 787, 802 + 1550, 832, 880, 1600, 1800, 2170, 2489, 2720, 40K

Neurosis

Like most psychological labels, the term “neurosis” is unscientific and can reflect the bias of the person who’s diagnosing as much as the person being diagnosed. Aberrant behavior and emotional misery can result from microbial waste products that get into the brain. Use frequencies for your specific infection. It’s amazing how emotions, thinking, and behavior can improve once the body is cleared of pathogens and chemical toxins.

28

Nocardiosis / *Nocardia asteroides*

Transmitted mainly through soil. Symptoms may include lung abscesses, fever and cough lasting several months, heart damage, and brain lesions leading to meningitis.

228, 231, 237, 694, 710, 887, 2890

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

Kilohertz set: 354950 (lowest), 355100 (optimal), and 355350 (highest)

Hertz set: 879.83 (lowest), 880.20 (optimal), and 880.82 (highest)

Also from Clark: 17679.39

Numbness

Lack of sensation in various parts of the body. Also see “Paresthesia” in this section; and various circulatory conditions under **HEART, BLOOD AND CIRCULATION**.

440, 600 + 625 + 650, 660 + 690 + 727, 787, 802 + 1550, 880, 1600, 1800, 2170, 2489, 2720, 10K, 40K

Obesity

See **OBSESITY / OVERWEIGHT**.

Obsessive-Compulsive Disorder (OCD)

Both OCD and Tourette's are linked to two microbes: *Mycoplasma pneumoniae* and *Enterococcus* (aka *Streptococcus*) *faecalis*. In immune-compromised people, *Strep*—mistaken by the body for a more dangerous form—can trigger immune cells to attack the person's own brain tissue.

Friendly flora may be lacking. Niacin (Vitamin B3) increases levels of tryptophan, an amino acid precursor to the neurotransmitter serotonin. There may be deficiencies in Vitamin B6, calcium, potassium, and magnesium. Vitamin C helps restore stressed adrenals.

Frequencies for *Streptococcus faecalis* can be obtained at dnafrequencies.com. Other *Strep* frequencies are in this Directory. See "*Mycoplasma*, many types" under **BACTERIA**. See "Schizophrenia" or "Bipolar Disorder / Manic Depression" in this section. The toxins from Lyme and related bacteria often mimic OCD, so also see **BACTERIA**, "*Borrelia*, all types / Borreliosis / Lyme Disease."

"PANDAS" / Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcus

PANDAS is an acronym for "Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcus." Many psychiatric disorders, including OCD (obsessive-compulsive disorder) and Tourette's syndrome, are linked to two microbes: *Enterococcus* (aka *Streptococcus*) *faecalis* and *Mycoplasma pneumoniae*. In immune-compromised persons, the *Strep* bacterium—mistaken by the body for a more dangerous form—can trigger immune cells to attack one's own brain tissue.

A multi-spectrum probiotic formula can help heal the gut. Frequencies for *Streptococcus faecalis* are available for a very reasonable price at dnafrequencies.com. In the meantime, try other *Strep* frequencies as well as "*Mycoplasma*, many types" and especially "*Mycoplasma pneumoniae*" under **BACTERIA**. Also see "Schizophrenia" and "Bipolar Disorder / Manic Depression" in this section.

Panic Attacks

See under **GLANDS, Adrenals**.

Paralysis in the Face

660 + 690 + 727, 787, 880, 10K, 40K

Paralysis, Non-Spastic / Languorous Paralysis

Muscular rigidity accompanying partial paralysis. In some cases, progress might be slow.

8.25, 9.19, 9.2, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 10K, 40K

Paralysis from Stroke

See "Stroke Paralysis / Apoplexy" in this section.

Paresthesia

Numbness and tingling due to pinched nerve. Also see "Subluxation / Spine Distortion" under **BONE AND SKELETON** or **INJURIES**. This is not a substitute for a chiropractic adjustment.

5.5

Parkinson's Disease

Chronic nerve deterioration and death, usually of the neurons that release the neurotransmitter dopamine. Dopamine sends signals responsible for smooth and controlled movements in the muscles. Symptoms include increasing tremor, muscular weakness and rigidity (which can change one's gait), and slowed speech.

The neurofibrillary tangles (toxic protein structures), which are present in Alzheimer's are also present in Parkinson's. These tangles can take decades to develop. Brain lesions, epileptic seizures, and symptoms similar to Multiple Sclerosis, Parkinson's, and other nervous system conditions can be caused by pathogens, inhalation or ingestion of pesticides, toxic metals, petrochemicals, artificial sweeteners, and some pharmaceuticals. People with a history of just one concussion or other head injury have an increased chance of developing Parkinson's.

Two 20-minute sessions daily with 670-nm LEDs covering the head may help. Also see "Transcranial Direct Current Stimulation" on page 909 of Appendix A.

The *Actinomyces* bacterium produces epoxomicin, a proteasome inhibitor that prevents the body from breaking down proteins. This causes symptoms resembling Parkinson's. *Actinomyces* lives in soil and well water; and more people in rural than urban areas develop Parkinson's. For its frequencies, see dnafrequencies.com.

Research by Dr. Robert Vink suggests that inadequate magnesium also increases susceptibility to Parkinson's, as does a deficiency of proper dietary fats. Try the mineral lithium orotate; see "Nutrients for the Brain and Nervous System" at the beginning of this section for details.

Read the dietary and other protocols in the "Alzheimer's Disease" entry. Also see "*Chlamydia pneumoniae*" and "*Nocardia asteroides* / Nocardiosis" under **BACTERIA**; and **CHEMICAL SENSITIVITY / POISONING**, "Mercury, Aluminum, and Other Contaminants." Also see **BACTERIA**, "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer," as new research shows that many people with Parkinson's are harboring this pathogen and improve when it's eliminated. This supports the belief of some researchers that Parkinson's—as well as a related condition, Alzheimer's—may be contagious, especially if a pathogen is involved.

There is strong evidence that prions might be involved as well. See **PRIONS / AMYLOIDOSIS** for details, including information on how to remove them. Finally, medical doctor Dietrich Klinghardt has reported that without exception, every person in his clinic who had Parkinson's (or Amyotrophic Lateral Sclerosis or Multiple Sclerosis)

tested positive for Lyme disease; so see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease.”

From Michael Tigchelaar (3 minutes each): First try 1440, then 6K, 3176, 4334, 1422, 871, 840, 827, 813, 744, 742, 733, 658, 611, 577, 569, 531, 524, 442, 314, 310, 172, 134

Alternate program: 1.1 + 73, 33 (for 30 minutes), 693, 813, 1131 (for at least 3 minutes)

For tremor (run for 10 minutes each): 5K, 6K

For temporary relief: 130, 169 and (for 10 minutes) 6K

For deterioration : 813, (10 minutes) 6K, 40K (6+ hours)

Polio / Poliomyelitis

Inflammation of the grey matter of the spinal cord, often beginning with gastrointestinal disturbances and fever, leading to atrophy of the muscles, and occasionally paralysis. Although this condition is sometimes called “Infantile Paralysis,” it also affects adults. Some recent studies indicate that the Epstein-Barr virus, which is implicated in chronic fatigue and mononucleosis, is one of seventy-two pathogens that mutated from the polio virus administered in vaccines. Also see “Meningitis” and other entries in this section; and entries under **VIRUSES**.

Main frequency: 1500

From Dr. John Garvey: 742, 1580, 2632

Also try: 135, 283, 428, 660 + 690 + 727, 776, 787, 802 + 1550, 807, 880, 10K, 40K

Psychosomatic Pain

When nothing obviously physical is discernible as the cause of a physical ailment, many laypersons (and doctors) think it’s psychosomatic—meaning “mind-induced,” and therefore invalid or not real. But the word simply means the interaction of psyche and soma, mind and body. Most (if not all) medical conditions are psychosomatic, having both physical and mental/emotional components. Psychosomatic pain can be due to energetic meridian blocks, nutritional deficiencies, microbial infection, or chemical toxicity. These can even be acquired from past generations. See **PAIN**.

Raynaud’s Disease

Nervous system disorder leading to disturbance of the circulation in the extremities, which can lead to congestion and swelling, and if severe enough, gangrene. 20, 660 + 690 + 727, 40K

Reflex Sympathetic Dystrophy (RSD)

Involves not only the muscles and nerves, but also the skin, blood vessels, and bones. It features severe chronic pain, inflammation, muscle or blood vessel spasms, and insomnia, depression, and anxiety. This condition often follows a fall or sprain, a break in a bone, an injury such as a knife wound, or a heart condition, infection, surgery,

spinal disorder, or other major trauma. The person may experience symptoms far from the site of the original trauma. Women in their 30s and 40s most commonly experience this condition. Even light clothing or a breeze can increase pain levels; and subjects are often sensitive to loud noises or vibrations. Other symptoms can include an inability to balance, short-term memory conditions, visual disturbances, jerky movements, muscle atrophy, and falling.

Make sure that the systemic pH and electrolytes are balanced. Consult a holistic health care provider. This condition is too new for Rife researchers to have computed frequencies for it. So see more entries in this section, as well as under **MUSCLES** and **CHEMICAL SENSITIVITY / POISONING**. Also see **GLANDS**, *Adrenals*, in case there’s adrenal exhaustion.

Relaxation, to Produce

See “Calming, to Produce” in this section.

Schizophrenia

Frank Strick’s research shows that the children of pregnant women with *Herpes* are more likely to be diagnosed later with schizophrenia and other psychological conditions than children of non-afflicted mothers.

The parasite *Toxoplasma gondii* has also been strongly linked to schizophrenia and bipolar disorder. In the latter part of the 1800’s, when house cat ownership became popular, these disorders, which had been almost non-existent, became fairly common. This parasite is carried by house cats and expelled through their feces. The house cats then jump from the contaminated litter box and walk over furniture and food preparation surfaces. In humans, this parasite causes brain lesions, changes in personality, and symptoms of psychosis, including auditory hallucinations and delusions.

See **PARASITES, PROTOZOA AND WORMS**, “*Toxoplasma gondii* / Toxoplasmosis.” Also see “*Borrelia*, all types / Borreliosis / Lyme Disease” and the “*Strep*” entries under **BACTERIA**; and “Borna Virus / Borna Disease Virus (BDV),” “*Herpes Virus Type 5* (Human *Herpes Type 5*) / Cytomegalovirus (CMV) / Salivary Gland Virus,” other *Herpes* entries, and “Retrovirus, variants” under **VIRUSES**, as recent studies show that these microbes have a strong link to mental illness. In children especially, abrupt onset of Obsessive-Compulsive Disorder (OCD) has been linked to *Strep* infection. Also supplement with N-Acetyl-Cysteine. Doses of 600 mg to 1200 mg or even 2400 mg per day have proven successful in normalizing certain neurotransmitter receptor sites. Check for deficiencies of the minerals lithium orotate and magnesium; more information is at the beginning of this section.

Sciatica

Sciatic nerve inflammation, felt at the back of the thigh running down the inside of the leg. Researchers at the Royal Orthopedic Hospital in Birmingham, England,

found pathogens near the nerve. They believe that microscopic tears in the discs of the spine allow pathogens to enter. Most frequencies below are general. Get a diagnosis for a specific pathogen.

10, 660 + 690 + 727, 787, 802 + 1550, 880, 40K

Sclerosis, Lateral

See “Amyotrophic Lateral Sclerosis (ALS)” in this section.

Sexual Problems

Many people may be unable to function sexually in ways that satisfy them. Although there’s often a psychological component to sexual problems, using Rife Therapy is still worth trying because an infection in the genitals or internal reproductive organs is almost guaranteed to interfere with sexual function and pleasure. Sometimes, using frequencies for syphilis makes a huge difference. There are many possibilities, so see any applicable entry under **MEN** or **WOMEN**.

Seizure

Sudden attack of painful, convulsive palpitations, with a decrease or complete loss of consciousness. Also see “Epilepsy” in this section.

226, 329, 953

Shingles

Caused by one strain of the *Herpes* virus, this condition features inflamed nerves along the skin. See **VIRUSES**, **Herpes, all types**, “*Herpes Virus Type 3 / Herpes zoster / Chicken Pox / Varicella / Shingles*.”

Spastic Ataxia

Movement difficulty, lack of muscle coordination accompanied by spastic or convulsive movements. Results might be slow if nerve damage exists, but even brain cells can regenerate, so keep trying. Also see other entries in this section.

7.69, 7.7, 8.25, 9.19, 9.2, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 1500, 1600, 1800, 2170, 2720, 40K

Spastic Paralysis

Convulsive, muscular rigidity accompanying partial paralysis. In some cases, progress might be slow.

7.69, 7.7, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 10K, 40K

Spastic Paresis

Partial, convulsive paralysis.

9.4, 30.87, 48, 600 + 625 + 650

Stammering

Psychotherapy and/or speech therapy may also help.

7.83, 20, 6K, 10K, 40K

Stroke

A hemorrhage (abnormal discharge of blood due to a burst blood vessel) into the brain or spinal cord. Symptoms may include speech disturbances, slow pulse, labored breathing, incontinence, unconsciousness, and even death. Go to the hospital immediately; don’t rely on frequencies! Immediately 3 + 230; then use the frequencies below.

Stroke Paralysis / Apoplexy

3 + 230, 6.3 + 148, 20, 40, 72, 95, 125, 146, 152, 293, 330, 333 + 523 + 768 + 786, 428, 442, 444 + 1865, 522, 555, 590, 600 + 625 + 650, 622, 660 + 690 + 727, 751, 776, 787, 797, 800, 832, 880, 1146, 1600, 1800, 2170, 2720, 8176, 10K, 40K

Study Mode, for Focusing and Comprehension

Frequencies are from Jimmie Holman. Designed to work on Pulsed Technologies equipment, they might not be as effective when used with other machines.

In this order: 31040, 58752, 59232, 39488, 46848, 46784, 33792, 37376, 33408, 40K, 48128, 34048, 43520 (for as long as desired)

Subluxation / Spine Distortion

See under **BONE AND SKELETON** or **INJURIES**.

Suicidal Tendencies

Mold and mold toxins may be involved. See **CANDIDA**, **FUNGI**, **MOLDS AND YEASTS**, and Staph, Cryptococcus and other infectious agents under **BACTERIA**. Many popular antidepressant drugs have caused people to take their own lives and harm others (see Chapter 1, page 52). In *The Mood Cure*, Julia Ross advises what nutrients to use for the brain to balance neurotransmitters and eliminate harmful emotional states. Also see “Depression” in this section.

Thalamus, to Stimulate

The thalamus consists of two bulb-shaped regions, each slightly more than one centimeter (about four-tenths of an inch), in the center of the brain beneath the cerebral hemisphere. These structures receive sensory, auditory, visual and other nerve impulses, they modulate sensory signals to and from the cerebral cortex, and they help to regulate arousal, one’s level of awareness, and activity.

20

Thyroid Gland Conditions

The thyroid is an extremely important gland. Not only does it regulate the nervous system, growth, development and metabolism, but a malfunctioning thyroid is a major cause of depression. See **GLANDS**, *Thyroid*.

TMJ

See “Teeth Grinding / TMJ Problems / Jaw Pain” under **DENTAL**, *Teeth*.

Tourette's Syndrome

Tourette's and obsessive-compulsive disorder have been linked to *Enterococcus* (aka *Streptococcus*) *faecalis* and *Mycoplasma pneumoniae*. In immune-compromised persons, *Strep*—mistaken by the body for a more dangerous form—can trigger immune cells to attack one's own brain tissue.

A good probiotic formula to heal the gut is critical to becoming well. Frequencies for *Streptococcus faecalis* are at dna-frequencies.com. Try other *Strep* frequencies; **BACTERIA**, "*Mycoplasma*, many types"; and "Schizophrenia" or "Bipolar Disorder / Manic Depression" in this section.

Trauma

Of physical, emotional, or mental origin. Also use a 635-nanometer or 660-nanometer LED; see Sidebar on page 661.

3.9, 15, 96, 95, 190, 192, 300, 465, 660 + 690 + 727, 760, 787, 880, 1565, 3K

Trigeminal Neuralgia

See "Neuralgia, Trigeminal" in this section.

Tuberculosis

This highly infectious airborne disease is popularly known for affecting the lungs. However, swelling and tumor-like welts of tissue may appear not only in the lungs, but also in the meninges (the membrane around the spinal cord) and the intestines. Other symptoms include fever, cough, and difficulty breathing. The list below is abbreviated. There are many frequencies for both the disease and its resulting so-called secondary infections, so also see **TUBERCULOSIS**.

First try: 369K (for the rod form, possibly used on Royal Rife's #4 machine)

Then try: 21508.01, 2127.5, 1070.82, 660 + 690 + 727

And then try: 20, 221, 333 + 523 + 768 + 786, 465, 532, 590, 776, 787, 799, 800, 801, 802 + 1550, 803, 804, 1132, 1500, 1600, 1644, 2008, 2313, 3353, 6516

Ulcer of the Stomach and/or Duodenum

Helicobacter pylori is found in ulcers (and stomach cancer). Although pathogen-related, ulcer is listed here due to its emotional component. Suppression of anger and other emotions can inhibit secretion of gastric juices and thus allow pathogens to proliferate. Counseling is suggested to address emotional awareness and expression. For frequencies, see **BACTERIA**, "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer."

Wernicke-Korsakoff Syndrome

Two syndromes combined. Wernicke's encephalopathy is neurological impairment whose symptoms include vision malfunction, memory loss, and ataxia (a lack of muscle coordination, resulting in abnormal gait). Korsakoff's syndrome features amnesia, invented memories, blackouts, and apathy. If not treated, it can lead to permanent brain injury and even death.

There are no known frequencies for this unusual combination condition. It often occurs with alcoholism. Some doctors believe that it is largely due to a deficiency in Vitamin B1 (thiamine), which is critical to the proper function of the nervous system and heart.

Whining and Irritability

Note that two of these frequencies are also used for inflammation. When someone is in a bad mood, it is said that their emotions are inflamed.

3.6, 3.9, 6.3

End of Brain and Nervous System, Mind and Emotions section.

BRAIN FUNGUS

See "*Gliocladium* / Brain Fungus" under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

BRAIN PARASITE

See "*Naegleria fowleri* / Brain Parasite" under **PARASITES, PROTOZOA AND WORMS**.

BRAIN TUMOR

See under **CANCER**.

BRANHAMELLA CATARRHALIS

See under **BACTERIA**.

BREKKBONE FEVER

See "Dengue Virus, Types 1, 2 and 3 / Dengue Fever / Breakbone Fever" under **VIRUSES**.

BREAST CANCER

See under **CANCER**.

BREAST, FIBROID CYSTS AND FIBROADENOMA

See "Fibroadenoma of Breast" and "Fibroid Cysts in Breast" under **TUMORS, BENIGN** or **WOMEN**.

BREAST INFLAMMATION

See under **WOMEN, Breasts**.

BREATH, BAD

See "Halitosis / Bad Breath" under **DENTAL, Mouth and Gums**.

BRIGHT'S DISEASE

Generic term for acute and chronic disease of the kidneys, which can involve many types of dysfunction. See various entries under **URINARY TRACT, Kidneys**.

BRONCHIAL ASTHMA

See "Asthma / Bronchial Asthma" under **RESPIRATORY TRACT, Lungs**.

BRONCHIAL CANCER

See "Lung Cancer" under **CANCER**.

BRONCHIAL PNEUMONIA, BRONCHIECTASIS, BRONCHITIS, AND BRONCHOPNEUMONIA BORINUM

See the “Bronchiectasis,” “Bronchitis,” and “Pneumonia / Bronchial Pneumonia” entries under **RESPIRATORY TRACT, Lungs**.

BROWN RECLUSE SPIDER BITE

See under **INSECT BITES**.

BRUCELLA / BRUCELLIASIS, ALL TYPES

See under **BACTERIA**.

BRUISE

See under **INJURIES**.

BRUXISM

See “Teeth Grinding / TMJ Problems / Jaw Pain” under **DENTAL, Teeth**.

BUBONIC PLAGUE

See “*Yersinia (Pasteurella) pestis* / *Pasteurella* / Bubonic Plague / Black Death” under **BACTERIA**.

BUNION

See under **ARTHRITIS**.

BURNS, MOST TYPES, INCLUDING FROM RADIATION

190, 200, 465, 660 + 690 + 727, 787, 880, 10K

BURSITIS

BY VIRUS

See under **CANCER**.

—C—

CALCIUM METABOLISM AND UTILIZATION, TO IMPROVE

Parathyroid disturbance can cause either an excess or a deficiency of calcium.

First try: 9.6, 10K

Then try: 326, 328, 4760.5, 673.1, 771

CALMING, TO PRODUCE

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

CAMPYLOBACTER

See under **BACTERIA**.

Don't Forget to Use Organ Support Frequencies

Royal Rife publicly stated that his equipment devitalized and destroyed the pathogens involved in cancer and various infectious diseases. Because Rife was promoting his technology to doctors, he had to use the prevailing medical model of his time. The model states that the cause of disease is either a bacterium, virus or parasite. We simply need to identify the offending pathogen, eliminate it, and then the person will be cured.

Today, however—thanks to our increasing understanding of how electromedical modalities work, plus the empirical experiences that so many rifiers have reported—we know that Rife's technology did much more than he or his colleagues said it did. Some of the frequencies appear to restore the cellular function of the host.

Scientists know that all living things emit an electrical charge, which indicates the vitality of the tissue. Healthy tissue emits charge within a certain range; inflamed tissue emits excess charge; and depleted, anaerobic, diseased tissue (including and especially cancer) emits too weak a charge. Pathogens are attracted to—and more easily attack—tissue that is undercharged; and when they do so, they lower the charge and vitality of the tissue even further. Considering Rife's genius and insight, it's reasonable to assume that he also knew about (or suspected) the regenerative effects of his Rife Ray.

There is an entire category of frequencies that, in helping each cell function more optimally, support immune function and restore vitality to organs, glands, and other tissues. So, when you give yourself a rife session, besides making sure that your lymph, kidneys and liver can handle the die-off from the pathogens, make time to use the frequencies under **REGENERATION AND HEALING**. Keep in mind that many of the numbers are experimental. However, the one frequency you can rely on is 40,000 (40K) Hz.

Consider running organ support frequencies for several days or even one week before using a program to disable pathogens. While you are targeting the pathogens, continue with the organ support. However, if you have a life-threatening illness such as cancer, begin the pathogen-killing programs immediately while still running organ support with each session. It may help you feel better.

If you have a serious illness, consult a practitioner familiar with Rife Therapy and detox protocols.

**Run 40K with each session
for as long as you want.
40K revitalizes the tissues.**

The Medical Profession Publicly Admits that Cancer Drugs Don't Work

In a 2004 issue of *Clinical Oncology*,¹³ the authors reported that the average contribution of cytotoxic chemo "therapy" to 5-year survival in adults was only an estimated 2.3% in Australia and 2.1% in the US. They urged doctors to reconsider the need for it, due to its high cost and negative impact on quality of life. The odds remain similar today.

Location of Cancer	% Successes, Australia	% Successes, US
Bladder, Kidney, Pancreas, Prostate, and Uterus	0.0	0.0
Stomach	0.7	0.7
Colon	1.8	1.0
Breast	1.5	1.4
Lung	1.5	2.0
Brain	4.9	3.7
Esophagus	4.8	4.9
Ovary	8.7	8.9
Non-Hodgkin's lymphoma	10.5	10.5
Cervix	12.0	12.0
Lymphatic system (Hodgkin's disease)	35.8	40.3
Testes	41.8	37.7

A 2014 *Journal of the American Medical Association* study showed that 72 cancer therapies approved by the FDA between 2002 and 2014 improved overall survival (OS) by only 2.1 more months than older drugs.¹⁴ A 2016 study, analyzing 62 anticancer drugs approved in the US and Europe between 2003 and 2013, found that only 23 drugs increased OS by only 3 months, 6 drugs increased OS by fewer than 3 months, 16 had no effect, and the OS rate of 8 could not be determined.¹⁵ At least 15 research studies (one from 1995) show that Tamoxifen, used for breast cancer, increases the risk of malignancies elsewhere.¹⁶ MRI scans show less activity in the brains of people who have received chemo, indicating clinical as well as a subjective experience of cognitive decline due to brain damage.

The Simoncini Baking Soda Treatment for Cancer

Some data shows that at least 79% of cancer subjects harbor various strains of *Candida* (mostly *Candida albicans*) in cancer tissue. Although Royal Rife and some modern researchers have found other organisms more directly involved in cancer, the appearance of *Candida* in the majority of cancer sufferers points to the fungus's function of scavenging diseased tissue. Eliminating the fungus would, at the very least, lessen the burden on the body.

Candida often attacks connective tissue, which is networked everywhere in the body and lacks the biochemical and structural means to prevent fungal invasion. *Candida* can survive almost any environment by altering its genetic structure. Thus, the almost unlimited locations of tumors, rather than being isolated diseases, indicates the adaptability of the fungus, depending on the terrain on which it feeds (pH, nutrients and wastes) and its container (where in the body it lives). *Candida* is so aggressive that it can rapidly recover from exposure to toxic fungicides—including chemo—but these poisons compromise the host's immunity, allowing the fungus to further damage the weakened system. According to former oncologist Tullio Simoncini, these factors all contribute to chemo's abysmal failure rate.

To eliminate cancer, Simoncini uses a 5% or higher sodium bicarbonate (baking soda) solution. Diffusing easily in the tissues, its alkaline environment is inhospitable to *Candida* and impedes the fungus's ability to reproduce. Because the bicarbonate must directly contact the tumor, it's usually not ingested. Instead, it must be continually administered in concentrated doses by a doctor who inserts a catheter into the arteries leading to the affected area. Simoncini reports that on the third or fourth day tumors start to shrink, and on the fourth or fifth day they collapse.

Conventionally trained physicians don't accept this treatment. Accounts from the holistic community are mixed.

For more information, see Simoncini's website, cancerisafungus.com.

CANCER

A complex condition, carried by the blood. Everyone harbors cancer cells, but the body routinely eliminates them unless one has been exposed to dangerously high levels of chemicals (including drugs), electrosmog, stress hormones over long periods, radiation, or other toxins. Early stages of cancer manifest as injuries that don't heal, unexplained persistent bleeding, and sudden changes in moles and other growths. Symptoms of full-blown cancer are larger masses of abnormal cells whose genetic programming has deviated from their usual blueprint. A tumor is the body's way of encapsulating diseased tissue to prevent it from spreading. Put another way, tumors are storage containers for systemic waste, which can range from abnormal protein products of inefficient metabolism to environmental toxins (pesticides, heavy metals, etc.).

Some people have a biopsy. Tissue is removed, and a doctor examines it for abnormalities so a cancer diagnosis can be confirmed or rejected. A biopsy can cause cancer to spread because once the protective tissue surrounding a tumor is pierced, cancer cells are released into the bloodstream. Also, if the cancer virus is attacked, it send shoots elsewhere so it can propagate itself. If the cancer spreads locally, it's called an "invasion." Spreading to a distance, it's called "metastasizing."

Biochemist and Nobel Prize winner Otto Warburg emphasized that cancer cells differ significantly from normal ones. Their cellular membrane potential is much lower, which is why electromedical devices that increase cell voltage are so successful at treating it. Cancer cell respiration is *anaerobic* (without oxygen) instead of *aerobic* (with oxygen). Unlike normal cells, cancer cells lack the enzyme catalase, which protects cells from being oxidized by ozone and hydrogen peroxide. This is why ozone therapy works so well (see Chapter 3, **Oxygen Therapies**). Saturating cancerous tissue with ozone neutralizes toxic materials, creates a climate unfavorable to abnormal cells, and strengthens healthy cells and immune function. Warburg noted that cancer cells metabolize about eight times faster than normal cells, but much less efficiently (which is why people with cancer become tired). Cancer cells cannot metabolize in the presence of oxygen, so they must ferment glucose. This is why a no-sugar diet is so important. It also helps explain why people with high blood sugar levels and/or insulin resistance are at a higher risk of cancer than people with normal blood sugar levels and normal insulin response. The intense need of cancer cells for sugar accounts for the success of a therapy in which coated drugs, specifically targeted to kill cancer cells, release their poisonous content only in the presence of sugar.

The presence or absence of light, and type of light, also plays a role. Scientists at the Northern California Cancer Center and other institutions found that exposure to natural sunlight for just 15 minutes a day significantly decreases the risk of prostate, breast, colon, and other cancers. In contrast, research from the University of Haifa in Israel in 2016 showed that even a moderate exposure to artificial light at night can raise the risk of breast and other cancers—partly

due to an increase in electrosmog, and partly because light prevents the pineal gland from producing melatonin, which has immune-enhancing properties.

There are many anti-cancer substances. Just a few are:

- ◆ *Vitamin B17* (amygdalin) is plentiful in bitter almonds and in apricot and peach kernels. (The drug Laetrile® is a synthesized version of natural B17.) In adequate amounts, amygdalin works selectively on cancer cells. The cancer cells metabolize the sugar in the kernels, releasing the phytochemical nitriloside inside the sugars. In response, the cancer cells discharge an enzyme, beta-glucosidase, which combines with the nitriloside to create hydrogen cyanide and benzaldehyde—but only locally, at the cancer site. These substances don't harm normal tissue in the amounts ingested, but they do kill cancer cells.
- ◆ *Inositol hexaphosphate* (IP6) is a complex sugar molecule in grains and legumes. Concentrated, it's a natural antioxidant that enhances the function and number of immune cells. It also regulates cellular communication, proliferation and differentiation, which makes it ideal as a tumor destroyer. This patented extract is safe even in large amounts. Over a decade ago, an article in *Nutrition and Cancer*, "Protection against cancer by dietary IP6 and inositol," described in detail the ability of IP6 to prevent cancer cells from spreading, inhibit their ability to produce their own blood supply, and to correct their malfunctioning DNA messages.¹⁷
- ◆ *Vitamin D3* improves immune response and inhibits the growth of cancer cells and tumors (among other functions).
- ◆ *Vitamin C* in high doses causes cancer cells to self-destruct.
- ◆ *Zinc* prevents cancer cells from growing in many areas.
- ◆ *Quercetin*, a bioflavonoid, escorts zinc into the cells.
- ◆ *Black cumin* (*Nigella sativa*) oil, an Indian spice, used in large amounts is anti-tumor. Almost 500 published studies show that it has eliminated cancerous tissues of the brain, breast, colon, pancreas (80% effective), and prostate. It rebuilds immune cells. Amount: 3 tablespoons a day, taken with food or freshly made vegetable juice. The first tablespoon is taken a half hour before breakfast, the second in the afternoon, and the third at night.
- ◆ *Turmeric root*, an Indian spice, inhibits tumor growth, prevents normal cells from becoming cancerous, helps the body destroy cancer, prevents cancer cells from forming a blood supply, and decreases inflammation. Ginger root (botanically related) has similar, if muted effects.
- ◆ *Hemp* and (more so) *Marijuana* compounds—if extracted properly, and *not* smoked—have anti-cancer properties. (See Chapter 3 for more details).
- ◆ *Iodine*, a mineral in which most people are deficient, is a potent germicide. It's taken internally and also painted, in liquid form, onto the skin at the tumor sites.

Essiac® Herbal Formula for Cancer and Other Illnesses

A Brief History of Essiac®

In the 1920s, Canadian nurse Rene Caisse noticed some scar tissue on the breast of an elderly woman who'd once had cancer. Thirty years earlier, the woman had avoided surgery by treating herself with an herbal formula learned from an Indian medicine man (thought to be from the Ojibwa tribe). After being given the formula, Caisse refined it, testing numerous combinations on mice and humans. She eventually decided on four herbs, called the formula "Essiac®" (her name spelled backwards), and offered it to thousands of people with cancer free of charge before the Canadian government threatened her with arrest. Most of Caisse's extensive lab notes were found and burned, and the formula was suppressed until recently. Some modern holistic physicians speak favorably of the anti-cancer properties in Essiac tea®; and Dr. Frederick Banting (who discovered insulin) surmised that Essiac® helps regulate pancreatic function. People take Essiac® not only for its anti-cancer effects, but also for its ability to normalize blood sugar levels, regulate immune function, and detoxify the liver and elimination organs. Essiac® is used successfully all over the world.

About the Herbs (make sure you use herbs that are not irradiated or fumigated)

Burdock Root (*Arctium lappa*): Purifies the blood. Helps neutralize and eliminate poisons, including radiation, from the body. Supports the bladder, kidneys, and liver. Has anti-tumor properties.

Sheep Sorrel (*Rumex acetosella*): Reverses the growth of cancer tumors. Has significant anti-leukemia properties. Protects against free radical damage. Stops hemorrhages. Diuretic. *Caution:* Make sure you are getting genuine sheep sorrel, and not yellow dock or garden sorrel or French sorrel (which are sometimes substituted for the desired herb).

Slippery Elm (*Ulmus rubra*): Soothes mucous membranes. Reduces inflammation in digestive, urinary, and respiratory tracts. Has anti-cancer properties.

Turkey Rhubarb Root (*Rheum palmatum*): Anti-tumor. Diuretic. Laxative. Anti-inflammatory. Antibacterial.

How to Prepare a Homemade Essiac-like Formula

6½ cups burdock root, cut
1 pound sheep sorrel herb, powdered
4 ounces slippery elm bark, powdered
1 ounce turkey rhubarb root, powdered

- ◆ Mix the dry herbs thoroughly. Store in glass in a dry, dark place until ready to prepare.
- ◆ The best pot to use is glass or enamel, then stainless steel, but never aluminum. Use ½ cup of herb mixture to one gallon of water. You may add 2 or 3 cups of water to replace what is lost through evaporation during boiling.
- ◆ Boil hard for 10 minutes, with the pot covered. Then turn off the heat. Let the tea steep for about 12 hours.
- ◆ Again heat the liquid until it's steaming hot.
- ◆ Let the mixture settle a few minutes, and then strain into clean bottles. When you strain the tea, do not use cheese cloth or a sieve with very fine mesh—otherwise, they may filter out the viscous and gelatinous slippery elm. The herbal residue that settles into the bottom of the jar can be used for poultices, eaten, or given to animals.
- ◆ Refrigerate the tea as soon as possible. Discard it if mold appears on the surface or if the tea does not taste right.

Amounts

- ◆ If you are taking this Essiac-like formula to treat an illness or eliminate toxins, take 2 ounces (¼ cup) three to four times a day. Drink plenty of extra water to flush out toxins from your system. Do not eat or drink anything except water one hour before to one hour after taking the formula.
- ◆ A maintenance dose is typically 2 ounces (¼ cup) once or twice a day, diluted with about ½ cup hot water. Drink plenty of extra water to flush out toxins from your system. Do not eat or drink anything except water one hour before to one hour after taking the formula.

Important

Do not change this formula. Its healing properties depend on the synergistic combination of ingredients. This drink works best when prepared as above, through boiling (which extracts all the nutrients and volatile oils from the herbs). This formula *may* work if made into a tincture (steeping the herbs in alcohol for several weeks). But it *won't* work if the herbs are taken in capsules. This formula has a reputation of complete safety and effectiveness. Doctors experienced with the formula report no ill effects whatsoever from Essiac®, even with high levels of oxalic acid from the sheep sorrel.

- ◆ *Selenium* is also severely lacking in people with cancer (especially thyroid cancer). This mineral inhibits tumor growth by binding antioxidants to DNA that needs repair.
- ◆ *Pancreatic enzymes*, taken on an empty stomach in very large amounts, were first used by William Donald Kelley, DDS (1925–2005). Kelley and his successors eliminated cancers (including of the liver and pancreas) in over 33,000 people. Studies begun in the 1940s showed that many of the over 30 enzymes produced by the pancreas circulate in the bloodstream, dissolving proteins in waste and on the outside of cancer cells. (The enzymes also help repair normal cells.) Kelley reported a 93% cure rate for *newly diagnosed* subjects if they did not receive radiation, chemo, or surgery. He prescribed fresh vegetable juices, coffee enemas (below), and the Budwig protocol (below).
- ◆ *Vegetable juice*. Fresh, living, raw juice (carrot, celery, cucumber, and other veggies) made each day are vital. Carrots, though high in sugar, contain falcarinol, an antioxidant with proven anticancer properties.
- ◆ *Coffee enemas*. Self-administered, they are designed to stimulate liver detox. See Chapter 3, pages 461–464.
- ◆ *The Budwig protocol* is named after German biochemist and six-time Nobel Prize nominee Johanna Budwig (1908–2003), who discovered that seriously ill cancer subjects are deficient in phosphatides and lipoproteins. When these nutrients are ingested 3–4 times daily for three months, tumors gradually recede and energy returns. Other ailments (including liver dysfunction and diabetes) are also healed. To obtain these ingredients, mix 1 tablespoon of flax oil in 2–4 tablespoons of low fat cottage cheese. (The yellow from the flax oil should completely disappear into the white of the cottage cheese.) When eaten together, the life-giving properties of each is released. Daily, people typically take one batch per 50 pounds of body weight, but no more than four batches. Flax oil must be fresh when bought. It turns rancid quickly, but can be safely stored in the freezer without becoming frozen itself. Budwig emphasized not to make substitutions, even for the dairy intolerant.
- ◆ *Diet* consists solely of unprocessed, whole, organic foods. Not all cancer subjects should be vegetarian. William Kelley found that some people require animal protein. Based on a sophisticated, very accurate system of metabolic typing, he did not advocate a “one size fits all” diet but advised different foods for different people.
- ◆ *Heat* disables cancer cells, which are much more sensitive to high temperatures than normal healthy cells. Sauna therapy weakens cancerous tissue with higher temperatures and also induces sweating, which eliminates the cellular and chemical debris that contributes to or causes systemic toxicity. Sauna therapy’s effectiveness is heightened by ozone (see Chapter 3). Mistletoe, when injected at a tumor site, sensitizes the tumor to higher

temperatures that kill the cancer without harming normal tissue. The high iron content of many types of cancers has also inspired the use of magnetism, which generates heat.

- ◆ *Electromedicine* (see Appendices A and C.) Rife Therapy devitalizes pathogens. BEMER® increases circulation in normal tissue. Magnetex® pulls debris from tissues. The VitaSet Generator protects against electropollution.

Cancer subjects often harbor high levels of other bacteria, fungi, and viruses. One microscopist has found *E. coli* infections in cancer subjects and advises rifting for it in every session. In 2002, University of Sheffield scientist Milton Wainwright discovered that a strain of *Bacillus licheniformis* resembling a fungus could actually induce cancer. Ronald Gdanski points out that up to 96% of cancerous masses grow in membranous and connective tissue, and mostly in open vessel or duct areas that have a low resistance to fungi: the bile duct, bladder, breast, colon, lymph nodes, pancreas, and prostate. After reviewing the medical literature on chemo, he stated that all chemo drugs are potent antifungal agents. This supports other observations that people with cancer are riddled with *Candida albicans* and other fungal forms (even if the fungus doesn’t cause the cancer). This data reinforces the importance of balancing the pH of the tissues and blood: if there’s nothing to scavenge, fungus won’t appear. Clean the terrain, and eliminate the pathogens’ food supply. Notably, *Candida* feeds on heavy metals. Research from doctors Walter Blumer and Elmer Cranton shows a 90% reduction in cancer mortality after EDTA chelation therapy to remove metals.

Dr. Hulda Clark reported finding the *Fasciolopsis buski* parasite in a majority of her clients, and stated that when the parasite was eliminated, the cancer did not progress. Due to the high prevalence of parasites in people with cancer, Rife scholars often advise running common parasite frequencies, including intestinal flukes, along with the cancer frequencies.

Recently, *Herpes* viruses have been discovered in cancerous tissue (independent of the so-called cancer virus). However, correlation doesn’t mean causation. When cancer cells are present and dividing wildly, the body may simply be more prone to certain types of infection. The following pages note which *Herpes* viruses have been found with which specific cancers, but be aware that *Herpes* viruses are known to spread; so they may exist in more than one type (location) of cancer. On a related note, some doctors have started administering antiviral drugs for the cytomegalovirus (CMV), whose proteins are found in several types of human cancers but not in the surrounding normal tissues. In several promising studies, people with malignant brain tumors who take antiviral drugs survive for a couple of years longer than those who receive surgery without chemo or antiviral drugs.

Cancer is a systemic imbalance of malfunctioning tissue, and the corrections required are unique for each individual.

books for treating cancer holistically:
HealingCancerNaturally.com

Found: Royal Rife's Frequency For Cancer; and How To Use It

In the 1930s, Royal Rife discovered two cancer viruses. He called them the *BX* (*Bacillus X*) virus and the *BY* (*Bacillus Y*) virus. For a long time modern rifers believed that the *BX* was 11,780,000 Hz and the *BY* was 11,430,000 Hz. While these frequencies did yield success, the results weren't as good as researchers hoped they would be—especially because the success rates did not compare to what Rife himself had achieved. Moreover, while the lab notes for the *BX* virus were found, the notes for the *BY* virus were not. Someone selling rife machines had posted the frequency for the *BY* virus on the Internet, but it wasn't clear where that number had originated.

To make matters more difficult, it turns out that notations for the *BX* virus—which had been available in Rife's own handwriting—were incorrect. In 2016, the British Rife Research Group wrote a paper explaining the errors. Due to a number of technical errors because of limitations of his equipment, Rife had recorded the wrong frequency for *BX* in his lab notes. The actual frequency that Royal Rife should have recorded was 12,830,000 Hz. (Its lower octaves, for equipment that cannot reach that high, are in the next column.) This frequency was used in the clinic that Rife's colleagues set up in 1934, which yielded mostly successful results for cancer subjects.

The above number has been further refined by Dr. Richard Loyd, who reports that it not only works very well, but it also (inexplicably) destroys the *BY* virus.

Sweeps. Sweeps catch mutations of stray pathogens. (Sometimes a sweep is notated "Sweep +/- 200." This means, run a sweep 200 Hz above and below the main signal.) To make sure that the signal lingers on a given frequency long enough, run it in small increments. For higher numbers in the MHz range, sweep +/- 200 and use 0.1-Hz increments. For lower numbers in the Hz range, sweep +/- 100 and use 0.01-Hz increments. These differences adjust for the frequency being used. Make sure to increase the duration of the session so you spend enough time on each frequency.

If your unit cannot reach the MHz range. To use lower harmonics of the MHz numbers, keep dividing by 2 until the range is within your machine's capacity.

The best waveform to use. Set the machine for a square wave, which provides harmonics that can be useful when rifeing for pathogens. (Sine waves as a rule don't contain harmonics.)

All Cancers—READ THIS FIRST!!!

No matter what kind of cancer you have or where it's located, use the frequency based on Royal Rife's original number (or its lower octave) in addition to any other frequencies that are specific to your situation. Royal Rife used high megahertz (millions of hertz) frequencies rather than low hertz frequencies to eliminate cancer because the Mortal Oscillatory Rates of the pathogens resonate in the high MHz ranges. However, many modern machines cannot reach the MHz ranges, especially if they use radiant plasma (as opposed to electrodes). If your unit can't output in the MHz range, use the lower octaves noted below.

Dr. Richard Loyd discovered that with a minor adjustment to the *BX* virus frequency, the *BY* virus also responds (he cannot explain why). Therefore, try this program first and use consistently. For this entry, the higher numbers are Hz rather than MHz (megahertz).

Pay attention to your response and to your lab tests. Continue your sessions even after you feel well.

For All Cancers (the *BX* virus), very good results:

- ◆ **12,833,000 Hz.** Sweep 200 Hz on either side of the main signal, in 0.1-Hz increments.
- ◆ **1,604,125 Hz** (a lower octave). Sweep 200 Hz on either side of the main signal, in 0.1-Hz increments. You can also run that frequency and 1,604,126 Hz at the same time, on two different machines or one machine with multi-signal capabilities.
- ◆ **200,515.62 Hz** (an even lower octave). Sweep 100 Hz on either side of the main signal, in 0.01-Hz increments.
Use with radiant plasma units, such as any of the ones made by Pulsed Technologies, or Resonant Light's PERL M+.
- ◆ **3133.056 Hz** (an even lower octave). Sweep 100 Hz on either side of the main signal, in 0.01-Hz increments.
Use with EMEM equipment or other "audio range" units.
Time: 1½–2½ hours, at least once (ideally twice) a day.
Alternate Program (supposedly the *BY* Virus), good results:
- ◆ **11,430,000 Hz.** Sweep 200 Hz on either side of the main signal, in 0.1-Hz increments.
- ◆ **1,403,000 Hz** (a lower octave). Sweep 200 Hz on either side of the main signal, in 0.1-Hz increments.
Time: 1½–2½ hours, at least once (ideally twice) a day.

From Jimmie Holman's Romanian laboratory tests. Note that these frequencies might not work on units other than those manufactured by Pulsed Technologies:

24024, 25520, 28392, 31800, 32760, 37128,
41496, 43120, 44520, 44688, 45000, 45864,
50232, 58968, 61712, 63336, 67704, 68208,
72072, 74480, 76440, 76560, 80808, 85176,
89544, 99506 (use the last one with care, due to die-off)

Two frequencies at once (from Dr. Loyd): 2,977,792 (upper harmonic of 727) and 2,974,659 (2,977,792 minus 3133).

Three-day protocol: One researcher recommends different sessions for Day #1, Day #2, and Day #3. These numbers are for a low-range unit. Use the other protocols first.

On Day #1, use frequencies between 2093 and 2205 in intervals of 8: 2093, 2101, 2109, 2117, etc.

On Day #2, use frequencies between 2096 and 2208 in intervals of 8: 2096, 2104, 2112, 2120, etc.

On Day #3, use frequencies between 2099 and 2211 in intervals of 8: 2099, 2107, 2115, 2123, etc.

Cancer not killed by 2008 or 2127.5: 2180, 2182, 2184

From Dr. James Bare: 10025, 10026, 10027; with an experimental sweep of 10022–10029

Pain from cancer, all types: 2008, 2127.5, 2720, 40K

If mercury or other heavy metals are involved, see **CHEMICAL SENSITIVITY / POISONING**. Also see **LIVER AND GALLBLADDER**, *Liver*, “Hepatitis C”; the “*Herpes*” entries under **VIRUSES**; **BACTERIA**, “*Chlamydia trachomatis*”; and all applicable entries under **PARASITES, PROTOZOA AND WORMS**. Also see “*Candida albicans*” and similar entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**, if there is fungal involvement. You can also run sweeps across the 450–900 Hz ranges, to which most bacteria and molds, and also some viruses, appear to respond. According to Dr. James Bare, viruses also seem to respond in the 1450–1850 Hz ranges so run sweeps here too, setting your unit for 30 seconds per one Hz step. The program may be long, but worth trying if your condition is severe.

Adenoma, Cervical

See “Uterine Cancer or Tumor” in this section.

AIDS

AIDS, possibly a form of cancer, is often considered a virus; so see viruses, “HIV (Human Immunodeficiency Virus) / AIDS (Acquired Immune Deficiency Syndrome).”

Astrocytoma

See “Brain Tumor / Astrocytoma” in this section.

Bacillus X Virus

See “BX Virus” in this section.

Bacillus Y Virus

See “BY Virus” in this section.

Basal Cell Carcinoma

See “Skin Cancer” in this section.

Dissolve Tumors Faster Using Two Units at the Same Time

To break apart tumors, Dr. Richard Loyd has conducted experiments running two frequency units at the same time, each set for a different frequency. This arrangement may work up to five times more rapidly than running a single frequency from one unit, due to a phenomenon in physics where two simultaneously running frequencies create a third wave pattern. These setups are especially useful when your machine cannot transmit in the very high Megahertz (MHz, or millions of Hz) range in which cancer viruses are known to oscillate.

The protocols below are named after the Rife researchers who used them. Using the first protocol, one experimenter reported destroying a tumor in just one week. *Be careful! People with brain tumors or lung cancer must use fewer minutes per program because a tumor that’s destroyed too rapidly can cause serious complications due to the immense amount of debris flooding the system.*

◆ **The Scoon Effect.** This method involves using two signals that are 1 Hz apart. You will need either two radiant plasma units or the Atelier Robin F165 electrode device (which can run two frequencies simultaneously). All equipment must be able to output frequencies to at least one decimal point place. On one plasma unit, run the main frequency and on the other plasma unit, run a second frequency just 1 Hz above the main frequency. On the F165 and other electrode generators that can output more than one frequency simultaneously, run both frequencies together.

The following frequencies are specified for equipment that cannot reach the MHz range. If possible, these programs should be used at a duty cycle of 73:

Example 1: 727 and 728, for at least 30 minutes

Example 2: 2007 and 2008, for at least 30 minutes

Example 3: 2127 and 2128, for at least 30 minutes

◆ **The Holland Effect.** This method involves using two signals, one of which is a *multiple of the other*. You will need two radiant plasma units. On one unit, run the primary frequency and on the other, run the *11th harmonic of the primary frequency*. For this protocol, it’s important to set your units to emit square waves to ensure that the signal emits enough harmonics.

Example 1: 1K and 11K for at least 30 minutes

Example 2: 2127 and 23,397 for at least 30 minutes

For more information, see Richard Loyd’s website, royalrife.com.

The Radiation Used to Treat Cancer—*Causes Cancer!*

Cancer is usually treated with chemo and radiation “therapy,” dispensed to either a small area or the entire body. We know that chemo consists of poisonous chemicals. But what, exactly, is the “radiation” dispensed as cancer treatment? And how does it work?

The radiation administered under medical auspices is *ionizing radiation* (IR), which can be in the form of X-rays, gamma rays, or radioactive substances including radioactive iodine. Ionizing radiation is acknowledged to kill cancerous cells because it permanently shatters the natural bonds between DNA strands. But IR also destroys the DNA of normal healthy cells. IR, reports B. Blake Levitt, “consists of very short wavelengths . . . which have enough power to knock electrons off their nuclear orbits and therefore can cause permanent damage on the cellular level . . . [including] genetic mutations.”¹⁸ This destabilization of atoms—in other words, the formation of *free radicals*—corresponds to toxic waste on a biochemical level. A toxic system explains the many “side” effects of this “therapy,” which include nausea, hair loss, diarrhea, memory loss, and scar tissue. But another “side” effect of this “therapy” is either a recurrence of the original cancer, or the formation of other types of cancers!

It’s common knowledge that radiation exposure—whether due to radioactive fallout from nuclear bombs, or meltdowns from nuclear power plants—increases the occurrence of cancers in people living near the source and even farther away. To use the radioactive materials acknowledged to *cause cancer*, as cancer *therapy*, makes no sense!

Bone Cancer

Soak the affected area in colloidal silver and Willard’s Water (Chapter 3 and Appendix A), and paint the area with iodine.

For at least 4 minutes each: 2008, 2125, 2128, 2131, 2140, 2145, 3524, 3672, 3713, 6130, 6601, 6672

Brain Tumor / Astrocytoma

Includes tumors in the spinal cord and brain. Persistent vertigo (dizziness) indicates a tumor in the cerebellum portion of the brain. Other symptoms include changes in memory, vision and mood; headaches; seizures; nausea; weakness; and numbness. Be aware that when cancer microbes are killed, water is left behind. In the brain (as well as the lungs), there’s no place for the water to drain, so you may have to pace your rifting at a slower pace until the water gets reabsorbed into the bloodstream.

Don’t hold a cell phone against the head. Use EMF protection (see Chapter 1, pages 11–16). Also see, under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, “Encephalitis” and “Meningitis.”

543, 641 (both from Dr. Garvey), 7.69, 7.7, 9.19, 9.2, 8.25, 20, 463, 466, 590, 664, 660 + 690 + 727, 720, 800, 832, 853, 855, 880, 2008, 2127.5, 2170, 2180, 2182

Breast Cancer

According to the American Cancer Society, men account for 1% of all breast cancer cases. Women are particularly susceptible due to their higher percentage of body fat. Toxic fat-soluble chemicals, including parabens (used in most cosmetics and body care products), are directly absorbed by fat cells, which are abundant in the breasts.

Major contributors to breast cancer are antiperspirants and deodorants. When the sweat glands are blocked by

antiperspirant, they can’t perform their natural function of sweating out toxic waste through the skin. Once this waste is prevented from leaving the body, it goes directly back into the bloodstream. Even if “only” a deodorant is used (without antiperspirant properties), it likely contains plastics (anything glycol), a solvent (any alcohol), and a toxic metal such as aluminum (which is a deadly poison and is implicated in many disease, including Alzheimer’s). Women—who are often made to feel ashamed of underarm hair and therefore shave it—are especially vulnerable because there’s no hair to block these chemicals and prevent them from being easily and quickly absorbed into the skin. Men who use toxic deodorant are less likely to absorb it, because much of it sticks to their underarm hair and never reaches the skin.

(If your body emits a strong unpleasant odor, you have too much waste material lodged in your cells and could use a detoxification program. There are alternatives to deadly chemicals in common commercial deodorants and antiperspirants. An excellent deodorant is a small spray bottle filled with some water and a few capfuls of grapefruit seed extract. You can also use a wet finger to spread undiluted grapefruit seed extract under your arms. This will kill bacteria and the odors that bacteria cause. See Appendix G for more options.)

Breast cancer tends to develop in the presence of excess bodily estrogen. Most plastics and some environmental chemicals contain estrogen-like substances that fit the estrogen receptor sites of cells, producing hormone-like effects. Unfermented soy products act in a similar manner. The plant-based estrogens in soy, which remain intact during processing, are hundreds of times more powerful than natural human estrogen and disrupt many bodily functions (see Chapter 3, **Food**). Diindolylmethane (DIM), a supplement derived from cruciferous vegetables, prevents testosterone (which women naturally produce in small amounts) from converting to estrogen in the body.

Women who regularly wear brassieres are three to four times more likely to get breast cancer than women who don't wear bras. Binding the breasts obstructs blood flow and hinders the normal circulation of lymph tissue in the armpit (an area that often produces cancerous cells). Immobilizing the breasts also diminishes the tone of the ligaments in the dense connective tissue that attach to the rib cage and support the breasts. Women fear that their breasts will sag unless a bra is worn; but the ligaments in the breasts (as elsewhere in the body) can atrophy if prevented from performing their weight-bearing tasks. Studies show that women in Japan who wear bras for the first time experience sagging of an inch in just a few months—and that they can reverse some of the breast sagging when they stop wearing bras. If you must wear a bra, make sure that it's loose fitting and constructed of natural rather than synthetic fibers. The bra should not contain "support" wire, either plastic or bone, which in the name of beauty interrupts the circulation of blood and lymph and thus prevents nutrients and oxygen from reaching the breasts and surrounding areas.

Coffee and chocolate, which contain caffeine and other volatile oils, contribute hugely to breast cancer! Some tumors shrink or disappear entirely after just these items are eliminated. Eat organic food and lots of greens.

According to David Brownstein and other top holistic doctors, iodine deficiency also plays a role in breast cancer. It should be taken in mg (not mcg) amounts. Some women apply Lugol's liquid iodine directly to their breasts, both as a preventive measure and also to eliminate tumors once they have formed. Italian oncologist Tullio Simoncini recommends applying a 7% dilution tincture of iodine ten to twenty times daily, allowing a scab to form and fall off naturally at least three times. Some people use topical creams from marijuana or hemp, valued for their potent anti-cancer properties. (The marijuana may work a bit better than the hemp, but it should never be smoked.)

Also see, under **VIRUSES, Herpes, all types**, "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)" and "*Herpes Virus Type 6 / Human Herpes Type 6*," because recent medical research indicates that these viruses are prevalent in aggressive breast cancer.

The following frequencies were calculated by Jimmie Holman. As they are a mathematical conglomeration of prior frequencies, there are fewer. However, they are more effective, being in a higher range.

10800, 10980, 12464, 13055, 13862, 14700, 14896, 16720, 19024, 19600, 19764, 20978, 21648, 22693, 22550, 22800, 23100, 27084, 27976, 32144, 32175, 34400, 32940, 34894, 36080, 39165, 40260, 40546, 43120, 43188, 43407, 43491, 45000, 45264, 46367, 49042, 53625, 61698, 63632, 66154, 66204, 68K, 68076, 69993, 75K, 75075, 75950, 83926, 88150

Bronchial Cancer

See "Lung Cancer" in this section.

Chemo Causes Cancer Cells to Grow

In Greek, the word *metastasis* means "removal from one place to another." Cancers often *metastasize*. What conventional medicine considers "primary" tumors can acquire greater motility and invasiveness, spreading to distant locations in the body via the bloodstream, lymphatic vessels, and membranes. For example, cancer first manifesting in the lung might spread to the liver, flooding the liver with cancerous lung cells. Metastasization often occurs after the subject has received toxic chemo. Thanks to new, highly publicized research, conventional medicine can no longer presume that this is a coincidence.

New York City Albert Einstein College of Medicine researchers and colleagues discovered that although chemo might initially decrease the number of breast cancer cells in a subject, ultimately its use is counterproductive because it triggers an environment favorable to the growth of tumors. Chemo actively interferes with the body's ability to repair itself and opens more "doorways" on blood vessels—thus encouraging the cancerous cells to not only grow back and increase in number, but also aggressively migrate through the circulatory system.

—summarized from

"Neoadjuvant chemotherapy induces breast cancer metastasis through a TMEM-mediated mechanism,"
Science Translational Medicine Volume 9, Issue 397

BX or Bacillus X Virus (from Royal Rife)

Rife's name for a carcinoma strain of cancer. Use the higher frequency if your unit can emit it. If not, keep dividing by 2 until you get a number in the range of your machine. Also see "BY Virus" (below), as Royal Rife's research suggested that there may be another form of the cancer virus. See page 672 for details on using this frequency.

12,833,000 (written as a MHz number: 12,833K)

From Dr. James Bare: 10025, 10026, 10027

Also try: 2127.5 (often seen on various lists as 2127 or 2128)

Also try: 2876, 3713

BY or Bacillus Y Virus (reportedly from Royal Rife)

Rife's name for a sarcoma strain of cancer. Some researchers believe that this is an enlarged form of the BX. These frequencies should be used in addition to—not instead of—those of the "BX Virus" (above). Use the higher frequency if your unit can emit it. If not, keep dividing by 2 until you get a number in the range of your equipment. See page 672 for details on using this frequency.

11,430,000 Hz (written as a MHz number: 11,430K)

Also try: 2008, 3524, 20080

A Concise Guide to Rifing for Cancer

Before You Do Anything Else

Before actively trying to destabilize the cancer, seek help from a holistic professional to ensure that your detoxification and eliminative pathways (liver, lymph, kidneys, and colon) can handle the die-off that will occur from rifing. Use the programs under **REGENERATION AND HEALING** to stimulate, support, and regenerate the eliminative channels, organs, glands, and overall system.

Session Schedules: Rifing Is Your Priority

Any cancer therapy schedule must be used aggressively. Cancer is persistent in its growth, so the means to stop it must be persistent as well. Healing may be expedited if sessions are at different times day to day.

- ◆ ***Most Common Protocol: Regular Sessions Every Day with No Rest Intervals.*** Most people who successfully eliminate cancer tell me that they adhere to the following schedule: Two sessions every day, one in the morning and one in the mid or late afternoon. Sessions normally last between 1½ and 2½ hours each. (This means up to 5 hours a day of session time.) This twice-daily protocol is followed for at least 6 months.

Does this seem like too much work? To some people, it is. They'd rather be doing something else than commit the time and energy that self-motivated healing requires. The above guidelines were developed because the elimination of cancer requires a very aggressive approach. It can take up to 10 days or 2 weeks to halt the spread of cancerous tissue before the body can then start to reverse the condition. Taking responsibility for your health requires patience. However, this means that you can very likely reverse the growth of your tumors—and have a far better chance to live a long time.

- ◆ ***Alternate Protocol (Not Recommended!): Regular Sessions Every Day for 5 Days with 2-Day Rest Intervals.*** Some people who successfully eliminate cancer tell me that they always give themselves breaks between sessions as follows: Two sessions every day, one in the morning and one in the mid or late afternoon. Sessions normally last between 1½ and 2½ hours each. This twice-daily protocol entails 5 days on the machine, then 2 days off, to give the body time to eliminate accumulated waste materials. This schedule is followed for at least 6 months.

The above protocol was promoted by a manufacturer whose staff noticed that some customers did well when they followed it. If you have different equipment, this protocol might not work for you—and even with the same unit, this protocol might not work. For cancer, my personal preference is to use the machine every day.

Don't take any "days off" from doing sessions unless you have a very good reason for interrupting your rifing, and you are being monitored at least twice weekly by a skilled practitioner. Even brief gaps in sessions may allow the pathogens to mutate.

- ◆ ***Follow-Up Maintenance for Everyone.*** The Rife researchers I know recommend that after the cancer is gone—and the subject is either pronounced "cured" as established through lab reports, or the cancer is said to be "in remission"—the person follow a maintenance program.

(a) One rife session *once a day* for several weeks or one month. Then gradually add intervals of days, and then weeks, between sessions.

(b) One rife session *every other day* for several weeks or one month. Then gradually add intervals of days, and then weeks, between sessions.

(c) One rife session *once a week* for several weeks or one month. Then gradually add intervals of days, and then weeks, between sessions.

Whichever schedule you decide to follow, *don't stop your sessions prematurely*. This includes taking a break just as you are starting to feel better. Continue rifing for one or two months even after all traces of cancer are gone! After, do a maintenance program until you see clear signs that you're balanced. You will have high oxygen levels; normal pH in all tissues and fluids; high voltage in the cells; and blood free of debris with round, separate red blood cells and viable immune cells.

The consequences of interrupting sessions can be fatal. Some friends were treating their Labrador Retriever for bone cancer once every day. After three weeks, the dog, who had been lethargic and barely able to walk, was joyously running through the woods. The sessions appeared to eliminate his pain, even though a large tumor on one of his legs was still visible. Encouraged, my friends devoted less time to rifing their dog, even though I pleaded with them to continue with the same daily schedule. Then the unit suddenly stopped working and had to be shipped to the manufacturer for repairs. By the time it was returned—leaving an interval of eight days without sessions—the dog was limping again. My friends put him back on the same program, but the Rife Therapy no longer worked, and the noble creature died.

Why did this happen? The buildup and transfer of energy takes time to achieve. The animal's cancer was so advanced that after the sessions stopped, the owners simply didn't have time to build up the momentum again—and the cancer sprang back, unchecked. Also, because the same program no longer appeared to have an effect, it's probable that the pathogens had mutated.

This story is not meant to scare you, but to emphasize that life-threatening conditions need attention. It took time for the cancer to develop, so you'll need to take time to eliminate it.

The Most Effective Frequencies for Cancer

For most health problems, frequencies below 20,000 Hz work well. For cancer, frequencies in the KHz (kilohertz, or thousands of Hz) range are more effective than lower numbers. However, some units cannot transmit in those ranges; so if yours can't, there are still some excellent tumor frequencies in the lower ranges.

Peter Walker cites research from German scientist Kurt Olbrich, who acknowledged that frequency therapies eliminate cancer much more successfully than drugs.

When treating cancer, it is very important to determine the exact frequency to use. Otherwise, the cancer virus will not be destroyed and in some cases may even grow faster. . . . Every person has their own systemic weaknesses and the development stage of cancers differs accordingly, according to the environment in the patient's body. . . . The frequency to use must be determined individually by testing the virus obtained from each patient under the microscope—just like what Royal Rife did. . . . Most people do not know that viruses do not have a fixed size. They are smaller when young and larger when full size; and this effects their resonance frequency, too.¹⁹

The body's terrain does contribute to a pathogen's oscillation rate. And a customized program is always preferable. However, for many individuals with cancer, the terrain is similar. Rifers have obtained better-than-average to excellent results with the frequencies in this Frequency Directory, especially those used by Rife himself. If you don't have a practitioner to customize a protocol for you, the lists in this Directory are a good place to start.

Can Some Frequencies Stimulate Cancer Growth?

This is true, but in a very narrow context. Over a period of 30 years, Australian medical doctor John Holt (now retired) was using a frequency of 434 megahertz (MHz)—or 434 million Hz—as part of an overall treatment to eliminate cancer cells. Peter Walker reports:

Activated cancer cells are vulnerable to low levels (150 rads) of X-ray radiation. . . . [However, under normal circumstances] only a small number of cancer cells are active at any one time, making cancer very difficult to treat [with X-rays]. . . . Holt discovered that by exposing the body to 434 MHz radio waves, all the cancer cells were activated for a short period (about 20 minutes)

and could thus be destroyed by subsequent low level X-ray radiation. . . . Over 35,000 patient records stretching back over a period of 30 years . . . [indicate Holt's] high success rates for treating cancer. . . . Dr. Holt's work became known to the Rife research groups in 2004 after an Australian television program, "A Current Affair" reported positively about Holt's work. . . . Yet his work had been largely ignored by cancer research organizations in Australia and elsewhere. . . . Despite several requests for his method to be scientifically validated in proper clinical trials, these requests were largely ignored except for two bogus trials that, according to Dr. John Holt, were not set up to properly validate his methods and were designed to discredit his work. . . . AMA doctors had not even bothered to look at his methods for over 15 years.²⁰

After Holt was denied access to X-ray equipment, he developed an alternative method to kill cancerous tumors by injecting them with a glucose blocking agent and then subjecting them to 434 MHz radio waves. All cancer cells require glucose in order to grow; so essentially he was starving them. Using a glucose blocking agent in conjunction with 434 MHz is generally believed to be less effective than X-rays, but it does help in many cases.

Incidentally, Dr. Holt believed that the main cancer-stimulating frequencies were in the radio wave range of 430 MHz to 440 MHz. However, he then found that frequencies in the microwave range above 2 GHz (gigahertz, or 2 billion Hz) could also cause cancer cells to grow. *Many cell phones operate in these ranges.* When placed close to the head, these high-frequency cell phones create brain tumors. Keep your phone on "speaker" mode away from your ear or use a specially designed protective earpiece. For vital information about electrosmog and remedies, see the Chapter 1 Insert, "Electromagnetic Fields and Your Health," pages 11–16.

The Best Rife Equipment for Cancer

Whatever equipment you use, the signal must penetrate deeply into the tissues. For an electrode unit, some rifers select the GB-4000, whose optional amplifier attachment emits (legal, low-power) RF to drive the signal into the body. For a plasma unit with a low-power (and legal) RF carrier, many rifers like the PERL-M from Resonant Light Technology. Those who don't want RF often select a plasma unit from Pulsed Technologies, whose special engineering sends the signal deeply into the body without having to use RF.

Some people with cancer use both electrode and radiant plasma units. They apply the electrodes locally at the tumor sites while running plasma, ensuring the successful delivery of the frequencies to all possible areas.

If Your Tumor (and Pain) Grow Instead of Diminish

After you've been rifting for a while, it can be scary to feel a mass that's larger and/or more painful than it was originally. But these changes don't necessarily indicate that the cancer is growing and spreading. Consider the following possible responses of tumors to rifting:

- ◆ *The tumor becomes smaller immediately*, a cause for celebration and obviously easy to handle emotionally.
- ◆ *The tumor becomes harder but doesn't grow*, which may be less easy to handle emotionally but at least it's apparent that the rifting is "doing something."
- ◆ *The tumor becomes larger before shrinking*, not easy to handle emotionally if it hasn't gotten smaller yet. An increase in tumor size may be the body's natural response to debris: toxins are surrounded to prevent migration to other areas. Swelling and inflammation occur after a tumor starts to break apart because the body is sending lymphatic fluid—blood plasma, liquid without the red blood cells—to cushion the area, and white blood immune cells to scavenge the wastes. This material surrounding the tumor is spongy or soft. If the tumor *is* being destroyed, the area will eventually become smaller. The waiting period can be difficult.
- ◆ *You feel new pain where none was felt before*, which can be emotionally difficult, especially if the tumor enlarges too. According to Dr. Richard Loyd, however, increased pain can be a good sign. Tumors often swell and get inflamed just before they disappear.

Always *monitor the tumor(s)*. Make sure your detoxification pathways and elimination channels are clear. Drink plenty of mineralized water to help flush the waste from your system.

Spend enough time with each frequency. Three minutes per frequency is a general rule with many (though not all) units and for most conditions. However, you may need to spend much more time with certain frequencies. One or two hours for one frequency is common.

If you know where the tumors are and you're using either electrodes, or a plasma unit whose tubes are meant to be held, work on a 6-inch square area at a time. Two tumors that are very far apart should be treated as two distinct areas. When using plasma, keep the light tube close to the cancerous areas.

If Your CEA Levels Increase While You're Rifting

CEA is an acronym for *carcinoembryonic antigen*, a protein found in embryonic tissue but not in normal tissue of infants, children, or adults. During pregnancy, CEA proteins assist in the rapid growth of the fetus. Cancer cells, which have abnormally rapid growth similar to that of a developing fetus, are thought to contain these proteins as well.

Cancer specialists typically use CEA levels as an indication of cancer in the body, but such tests may be unreliable. Not all cancerous tissue produces CEA, which appears to be limited to the lung, breast, ovary, pancreas, and a few other sites. Increased CEA levels can also indicate states *unrelated* to cancer, such as some types of inflammation, liver conditions, and stomach ulcers. Also, smokers tend to have higher CEA levels than non-smokers.

The late New York City-based medical doctor Nicholas Gonzalez—the recipient of a \$1.4 million grant from the National Center for Complementary and Alternative Medicine, and specialist in the Kelley cancer program (raw juices, coffee enemas, the Budwig protocol, and huge amounts of pancreatic enzymes)—had a more comprehensive understanding of CEA readings. The reason CEA tests are so unreliable, Gonzalez said, is that when a tumor breaks down, it releases measurably high amounts of CEA into the bloodstream. Ironically, the healing due to the breakdown of a tumor is often misinterpreted in lab reports to mean that the person is becoming sicker, which is the opposite of what is actually occurring. As an illustration, Gonzalez mentioned one person who completely recovered from cancer and had a CEA of 350,000—the highest in medical history.

I would never tell anyone with cancer not to see a doctor. However, evaluating CEA results as negative, without understanding what the numbers may actually indicate, can cause unwarranted fear. This is why I suggest a skilled holistic practitioner who is experienced with how the body works under cancerous conditions.

If Your PSA Count Increases While You're Rifting

PSA, an acronym for *prostate-specific antigen*, is an enzyme produced by the prostate gland in small amounts. According to allopaths, when too much PSA enters the bloodstream, or if it enters the bloodstream too quickly even when levels are within so-called normal range, this indicates enlargement, infection, or disease of the prostate. The first protocol that doctors suggest for men with high PSA readings is high doses of pharmaceuticals.

Most men with elevated PSA levels, afraid of dying from cancer and unfamiliar with holistic concepts, understandably follow their doctor's advice. However, holistic medicine offers a much different interpretation. This situation is similar to that of CEA readings (see previous heading). When a prostate tumor starts to break apart, the PSA count can rise in response to microbial die-off. A PSA test doesn't distinguish between active (viable) and inactive (non-viable) viruses. If the viruses are disabled by the body, it means that the immune response is working properly.

An experiment described in the *Journal of the National Cancer Institute* exposes the conventional medical model as an assumption rather than a fact.

Measurement of serum levels of prostate-specific antigen (PSA) is widely used as a screening tool for prostate cancer. However, PSA is not prostate specific, having been detected in breast, lung, and uterine cancers. In one study, patients whose breast tumors had higher levels of PSA had a better prognosis than patients whose tumors had lower PSA levels. . . . To our knowledge, this is the first report that PSA may function in tumors as an endogenous antiangiogenic protein [which prevents cancerous tumors from developing new blood vessels]. This function may explain, in part, the naturally slow progression of prostate cancer. Our findings call into question various strategies to inhibit the expression of PSA in the treatment of prostate cancer.²¹

Since the publication of this experiment in 1999, the medical community has put more energy into developing procedures that deprive rapidly growing cancerous tissue of its needed blood supply. However, many doctors (as well as men with prostate cancer) still erroneously believe that high PSA levels indicate illness, and respond with inappropriate treatment.

Dr. Nicholas Gonzalez had advised that people with high PSA levels (one hundred or over) for long periods are *recovering* from cancer. In his experience, increased PSA levels signified a positive, healing response by the body.

Rifing Alongside Radiation and Chemo

Big Pharma uses the word “therapy” to divert attention from the inherent toxicity of radiation and conventional chemo—neither of which work. The radiation used for cancer is the same type of dangerous radiation emitted by nuclear reactors when they leak, so there’s never any good reason to expose yourself to it no matter what it’s called. (Note that Rife Therapy may not be able to repair all of the DNA damage caused by radiation.)

Conventional chemo “therapy” consists of strong poisons (usually antifungal) that are administered either via intravenous drips or injection. The chemicals don’t remain at the tumor sites, but spread throughout the body. The rationale (and hope) is that the cancer cells will die from these poisons before the rest of the body does. However, what chemo actually does is very different from what we imagine or wish it does. Chemo suppresses immune function and impairs the liver’s ability to do its job, that of breaking down toxic substances into harmless byproducts. A cancer-ridden body is generally too weak, debilitated, and stressed to eliminate poisonous chemicals that the body was never designed to handle. Moreover, recent research has shown that chemo creates an environment *favorable* to tumor growth—so even if levels of cancerous cells initially decline, they can (and are mostly likely to) eventually *spread*.

Rifing causes waste. This is why, for most people who have previously received chemo (or who are currently receiving it), rifing doesn’t work as well as it could work for people who haven’t had chemo at all. These detoxification issues don’t indicate anything negative about Rife Therapy; they simply demonstrate that the frequencies are doing their intended job.

Should you insist on combining chemo with rifing, be careful. First, consult a qualified *holistic* practitioner to ensure that all detox channels (colon, kidney, liver and lymph) are functioning properly. Be aware that the energy fields from rife units can cause *electroporation*, or increased permeability of cell membranes. This means that higher levels of chemo will be escorted into the cancerous cells, increasing the potency of your usual dose. Therefore, *your chemo dose will probably need to be lowered if you’re rifing. You must be carefully and consistently monitored to ensure that you’re receiving the correct amount.*

One rife manufacturer unofficially recommends waiting two to five days between chemo and the next rife session. In my opinion, waiting is counterproductive because during that period the pathogens could mutate. If you’re feeling so ill from chemo that you need to wait, I have to ask what you’re hoping to accomplish by receiving chemical poisons that have been proven not to eliminate cancer, and which are very likely making you sicker.

Many people with cancer have told me that they sincerely believed Rife Therapy had merit. However, having received a grim prognosis from their doctor—not to mention intense pressure from distraught family members—they panicked, threw away their discernment, and underwent chemo (sometimes with rife sessions, sometimes without). Mindlessly following establishment medicine, they could no longer take responsibility for their health and therefore were unable to utilize rifing or other holistic protocols correctly. Under these circumstances, Rife Therapy was set up to fail. And it usually did.

If your detox and elimination pathways are reasonably clear and your immune response has not been destroyed by anti-cancer agents, you have more options. There are a surprising number of viable alternatives to conventional chemo. Some enlightened doctors are achieving good results by administering low doses of chemicals locally along with heat, which makes tumors more vulnerable to being destroyed. There is already a history of heat being successfully used with the herb mistletoe, injected at the tumor site(s). A local toxicity rather than systemic toxicity always makes it easier for the body to handle any die-off from rifing. In Europe, cancer subjects have been able to accomodate a rife session on the same day as the administration of these highly localized therapies.

It can be very helpful to hear about others’ experiences with rifing. Appendix A lists some Internet Rife Therapy support groups that you can join.

Candida Carcinomas

Malignant tumor in connective tissue accompanied by *Candida albicans*. Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Candida albicans*."

465, 2167, 2182

Carcinoma

Malignant tumor enclosed in connective tissue, from the inner or outer epithelial lining of organs. According to the Australian Naturopathic Network, *Euphorbia peplus* (radium weed) has been found to help sun spots, basal cell carcinoma, and squamous cell carcinoma to drop off. Also see specific area and/or condition, and "*BX Virus*" in this section.

From Dr. James Bare: 10025, 10026, 10027

55, 127, 304, 462, 590, 644, 660 + 690 + 727, 787, 852, 856, 880, 901, 1352, 1582, 1820, 2008, 2098, 2104, 2112, 2120, 2127.5, 2120 to 2130 (scan), 2136, 2144, 2152, 2160, 2168, 2176, 2184, 2192, 2200, 2217, 5K, 9999

Cervical Adenoma or Cervical Cancer

See "Uterine Cancer or Tumor" in this section.

Esophageal Cancer

There are no known frequencies for this type of cancer per se. Use the overall cancer frequencies at the beginning of this section. University of Texas (Arlington) researchers discovered that the mineral zinc selectively stops cancer cells from growing, especially in the esophagus, while leaving normal cells alone. Zinc is driven into the cells by quercetin, a bioflavonoid supplement. Both are available in stores.

Colon Cancer

Also known as colorectal cancer. A zinc deficiency often exists. Also see "Intestinal Cancer" in this section.

From Dr. John Garvey: 656, 1744

Fibrosarcoma

Malignant tumor containing connective tissue developing rapidly from fibrous tissue.

From Dr. John Garvey: 1744

Gastric Cancer

676

Glioblastoma

See "Brain Tumor / Astrocytoma" in this section.

Glioma

See "Brain Tumor / Astrocytoma" in this section.

Hodgkin's Disease / Lymphogranuloma, Malignant

Malignant enlargement of the spleen, lymph tissue and liver, often accompanied by weight loss, fever, night sweats, increased white blood cell count, and anemia (decrease in number of red blood cells or in the oxygen-carrying capacity of red blood cells). Hodgkin's Disease is unusual for cancer because the tumors do not contain much abnormal tissue. Also see **BACTERIA**, "*Chlamydia pneumoniae*" and **VIRUSES**, *Herpes*, *all types*, "*Herpes Virus Type 3 / Herpes zoster / Chicken Pox / Varicella / Shingles*," as about one-quarter of people with Hodgkin's Disease are also afflicted with this form of *Herpes*. Also see **VIRUSES**, "Epstein-Barr Virus / Infectious Mononucleosis

My Story of Cancer: Not Intimidated by the Cancer Establishment

Perhaps you've read [these stories] in women's magazines. Usually the woman finds out by accident she is sick. Then on we read through the grueling treatment, through one, perhaps two apparent remissions inevitably followed by the return of the disease. We read as the woman distances herself from her professional life, as her significant relationships deepen or disappear. Then the woman dies. My story is not like that. Now when I read those stories, I see something else: how intelligent, educated women listen to what conventional American medicine tells them about cancer, how they accept their treatments, no matter how damaging or horrific, and die. I wonder at how little they question what caused their cancer and why their treatments are so debilitating and ineffective. Perhaps because of their ordeals, death is a longed-for release when they write about it, but somehow I believe that between the period of the final, eloquent sentence and the beginning of the editor's italicized note there was a whole world of suffering.

Truth #1: I didn't need all that chemotherapy and radiation. I discovered less invasive therapies to kill the cancer and rebuild my immune system. Truth #2: I did discover reasons why I developed cancer. These reasons may or may not be true, but they satisfy my need for reasons. The strategies appear to be working because I have never felt better. Truth #3: I do stand up against the medical establishment. I believe that if I had taken the "cure" conventional medicine offered me, I would never be as mentally and emotionally strong as I have become.

Cancer treatment is a question of choice. You either choose to treat your cancer with alternative treatments and learn to live with the ambiguity of always being outside the medical establishment, or you allow doctors to treat your body as if it were a third world country with a particularly nasty dictator that they nuke and poison until they say you are cancer-free, and then you wait.

—Susan Hussey, "One Health, One Disease"
excerpted from *Organica News*, Winter-Spring 2005

/ Chronic Fatigue Syndrome (CFS),” as medical research indicates that this virus is also prevalent in Hodgkin’s. 1522 (from Dr. John Garvey), 10, 440, 880, 552

Intestinal Cancer

May be caused by *Fasciolopsis buski*, otherwise known as a fluke (or type of flatworm), which is also implicated in ulcers. Also see “Colon Cancer” in this section.

55, 15, 2K

From Dr. Hulda Clark: 21607.59, 1075.78 (adult and eggs), and 21508.01, 1070.82 (larvae)

Larynx Cancer

The larynx, also known as the voice box, is the portion of the anatomy in the throat that contains the vocal cords.

327, 524, 731, 1133

Leukemia

Malignant, abnormal increase of white blood cells. Exposure to radioactivity, dangerous chemicals, or parasites may be involved. Recent studies show Epstein-Barr Virus present in a statistically high number of leukemia cases; so see “Herpes Virus 4 (Human Herpes Virus 4) / Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)” under **VIRUSES, Herpes, all types**. Also see “Leukocytosis / Leukosis” in this section.

55, 590, 660 + 690 + 727, 787, 880, 2008, 2127.5, 2217

Leukemia, Feline

Cancer of the blood and bone marrow in cats, spread by contact with urine, feces, saliva or vomit from an infected cat. Symptoms are lethargy, dehydration, and fever. Cats are stricken suddenly and kittens under four months usually die within two days. Also see **VIRUSES**, “Feline (Cat) Immunodeficiency Virus (FIV).”

258, 332, 414, 424, 544, 741, 743, 830, 901, 918, 997

Leukemia, Hairy Cell

A shortage of, and abnormal, blood cells. Also see “Leukemia” in this section.

122, 622, 932, 5122 (all from Dr. Garvey), 488, 781

Leukemia, Lymphatic

Malignant, abnormal increase of lymphocytes, a type of white blood cell that includes NK (natural killer) cells, T cells and B cells, which are produced in the lymph. Also see “Leukemia” in this section.

From Dr. John Garvey: 478, 833

Leukemia, Myeloid

Malignant, abnormal increase of leukocytes or white blood cells (produced in many different parts of the body). Also see “Leukemia” in this section.

From Dr. John Garvey: 422, 822

Leukemia, T cell

Malignant, abnormal increase in the number of T cells, a type of lymphocyte. Also see “Leukemia” in this section. From Dr. John Garvey: 222, 262, 822, 3042, 3734

Leukocytosis / Leukosis

Increase of leukocytes (white blood cells) or of the tissue that forms them. Also see “Leukemia” in this section.

612, 633, 644, 653, 3722

Liver Cancer

Typical symptoms include nausea, vomiting, liver pain, and jaundice. Milk thistle and fresh vegetable juices are used for support. See, under **LIVER AND GALLBLADDER, Liver**, “Hepatitis B” and several entries of “Fluke, Liver.”

214 (from Dr. John Garvey), 393, 479, 520, 734, 3130

Lung Cancer

Some people are asymptomatic, but others experience unremitting coughing, chest pain, shortness of breath, coughing blood, and fatigue. When cancer microbes are killed, water is left behind. In the lungs (as well as the brain), there’s no place for the water to drain, so you may have to pace your rifing at a slower pace until the water gets reabsorbed into the bloodstream. Try breathing ozone through olive oil, or inhaling colloidal silver through a medical nebulizer or an ultrasonic humidifier with its filter removed (see Chapter 3). Two common viruses have recently been associated with lung cancer, so also see under **VIRUSES**, “Papilloma Virus / Human Papilloma Virus (HPV)” and “Rubeola / Measles.”

From Dr. John Garvey: 462, 852, 1582

Also try: 776, 2104, 2144, 2184, 3672

Lymphogranuloma, Malignant

See “Hodgkin’s Disease / Lymphogranuloma, Malignant” in this section.

Lymphoma, Non-Hodgkin’s

Enlarged lymph nodes and perhaps lesions in the lung, bone, gastrointestinal tract, and skin. In a University of Southern California study of 268 sick children who had Non-Hodgkin’s Lymphoma, those whose mothers used pesticides in the home once or twice a week were almost 2.5 times more likely to develop Non-Hodgkin’s Lymphoma as the control group. If the mothers used pesticides more often, the children were 7 times more likely to develop the cancer. Pregnant women exposed to pesticides by exterminators in their homes were 3 times more likely to have a child with cancer. Children directly exposed to pesticides were 2 times more likely to develop cancer. For detoxification assistance, see entries under **LIVER AND GALLBLADDER, Liver**, and **RESPIRATORY TRACT, Throat and Lymph Nodes**. See **CHEMICAL SENSITIVITY / POISONING**. Also see **VIRUSES**, “Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome

(CFS),” as medical researchers have found that this virus is often prevalent in lymphoma.

First try: 574, 588, 666, 778, 1078, 1120, 1340, 1440, 1744, 3524, 3713

Then try: 2004, 2008, 2012, 2016, 2128, 3672, 7760

Melanoma Metastasis

A pigmented mole-like tumor usually on the skin that can move to other parts of the body. Also see “Mycosis Fungoides” and “Skin Cancer / Squamous Cell Carcinoma / Basal Cell Carcinoma” in this section.

979

Multiple Myeloma

Abnormal, diffuse increase of plasma cells in the bone marrow, accompanied by anemia (deficiency of red blood cells or iron), and painful swellings on ribs, skull, and spine. Also see other frequencies in this cancer section.

967 (from Dr. Richard Loyd), 249, 418, 475, 647

Mycosis Fungoides

A type of skin cancer resembling eczema. Also see, in this section, “Melanoma Metastasis” and “Skin Cancer / Squamous Cell Carcinoma / Basal Cell Carcinoma.”

853 (from Dr. John Garvey), 532, 662, 678, 1444

Non-Hodgkin’s Lymphoma

See “Lymphoma, Non-Hodgkin’s” in this section.

Oligodendroglioma

See “Brain Tumor / Astrocytoma” in this section.

Ovarian Cancer

Rare in women under 40, the most common symptoms are persistent abdominal bloating, constant pain in the pelvic area and abdomen, and digestive upsets, including feeling full soon after eating or not being able to eat much. Other symptoms include abnormal diarrhea or constipation, a frequent need to urinate, and constant fatigue. Don’t rely solely on the following experimental frequencies. Also see “Cervical Cancer” in this section, and run the general cancer frequencies.

0.07, 0.55, 0.85, 22.5, 47.5, 475.03, 527, 667, 752.7, 988.9

Pancreatic Cancer

High amounts of pancreatic enzymes are taken on an empty stomach for many months. Dr. Hulda Clark saw liver flukes clogging the pancreas, so also see various liver fluke listings under **PARASITES, PROTOZOA AND WORMS**.

Run 4 to 5 minutes each: 545, 547, 556, 600 + 625 + 650, 660 + 690 + 727, 784, 787, 1560, 2K, 2184, 2455, 2489, 2492. Also run 2008 and 2127.5 between 45 minutes and one hour per day.

Plasmacytoma

A tumor containing plasma cells occurring outside of the bone marrow, such as the inner organs and lining of the nose, mouth, and throat. Do not rely solely on the frequency below! See “Multiple Myeloma” and other entries in this section.

From Dr. John Garvey: 475

Polycythema Vera

The bone marrow makes too many red blood cells. Symptoms include itching and severe burning in the skin.

5K (run for an hour at a time), 40K (run as long as desired)

Prostate Cancer

This common, relatively low-risk cancer in men features slow-growing abnormal cells in the prostate gland (which produces semen). Occasionally, tumors that grow too large can press on the bladder and prevent urination. Selenium deficiency is associated with a 500% increase in prostate cancer. A heated rectal probe can successfully contain or eliminate this condition. Also see **BACTERIA**, “*Propionibacterium acnes*,” as this microbe may be a secondary cause of some prostate cancers.

20, 60, 72, 95, 125, 304, 408, 442, 660 + 690 + 727, 688, 748, 766, 787, 790, 800, 854, 920, 1840, 1875, 1998, 2008, 2050, 2127.5, 2120, 2125, 2130/2131, 2140 (for 3 to 6 minutes), 2145, 2217, 2250, 2288, 2720, 3672 (for 3 to 4 minutes), 5K, 10025

Rhabdomyosarcoma

Striated muscular tissue tumor.

660 + 690 + 727, 784, 880, 2K, 2005, 2008, 2016, 2048, 2084, 2093, 2100, 2127.5, 2184, 2217, 2586, 6024, 6384

Rhabdomyosarcoma, Embryonal

Striated muscular tissue tumor; but this one is undifferentiated and somewhat resembles an embryo.

Major frequency: 2586

Then try: 2004, 2008, 2016, 2032, 2040, 2060, 2586, 4445, 5476, 6024

Sarcoma

Tumor, sometimes with connective tissue. Also see specific area condition and “BY Virus” in this section.

From Dr. James Bare: 10025, 10026, 10027

55, 127, 462, 590, 660 + 690 + 727, 787, 852, 856, 880, 1582, 1755, 2008, 2120 to 2130, 2127.5, 20080

Skin Cancer / Squamous Cell or Basal Cell Carcinoma

Squamous cell tumors are thick and rough and occasionally ulcerated, with a crusted surface over a raised, grainy surface. *Squame* is Latin for “fish scales.” Tumors appear most often on the face, ears, lips, neck, bald scalp, hands,

shoulders, arms, and back. Skin that's injured from burns, chemicals, chronic sores, scars, X-rays and tanning booths (which dispense dangerous UV wavelengths) is more prone to cancer. Those with fair skin, light hair, and blue or green eyes, as well as people with poor immune function, are at higher risk than dark eyed, darker skinned people.

Chronic inflamed skin lesions, moles, or sores that don't heal may indicate squamous cell carcinoma; see a doctor. Early treatment is often effective. Despite modern warnings to avoid the sun, Dr. Royal Lee discovered that the sun's rays are either harmful or healing, depending on one's diet: skin cancer may erupt if polyunsaturated fatty acids are lacking in the diet (see Chapter 3, page 434).

A certain preparation has been found to eliminate skin cancers (see Sidebar, "Black Salve (Cansema) for Skin Cancer"). Also see, in this section, "Melanoma Metastasis" and "Mycosis Fungoides."

Run 760 and 2116 (for 30 minutes), 2280 (for at least 5 minutes), and run for 4 minutes each: 666, 2008, 2125, 2128, 2131, 2140, 2145, 3672, 6601, 6130, 6672

Stomach Cancer

All of the frequencies below are for *Helicobacterium pylori*, a bacterium also implicated in ulcers. The most helpful antibacterials for ulcers are colloidal silver; the probiotic *Lactobacillus salivarius*; essential oil of oregano; and Manuka (tea tree) honey from New Zealand (which should be labeled at least UMF 15+, which stands for "Unique Manuka Factor" that designates the honey's antibacterial strength). Use the general cancer frequencies in addition to the ones below. Also see "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" under **BACTERIA**; this pathogen is often implicated in stomach cancer.

First try: 676 (for at least 30 minutes a day)

Also try: 660 + 690 + 727, 676, 880, 2167, 2950

Squamous Cell Carcinoma

See "Skin Cancer" in this **CANCER** section.

Testicular Cancer

Cancer of the testicles (male gonad that stores sperm), in which the most common symptom is swelling and/or a lump in one or both testes. There may or may not be feelings of heaviness and pain, either in the lower belly or the groin, along with extra fluid in the scrotum (the sac of skin covering each testicle). Occasionally, a testicle might be shrunken. This cancer accounts for 11%–13% of all cancer deaths in men between ages 15 and 35.

Iodine expert Dr. David Brownstein recommends painting the testicles with liquid iodine. This can be done up to 20 times a day, as iodine is a potent germicide and most people are deficient in this vital mineral. Use general cancer frequencies. The frequency below, specified for testicular cancer, is experimental and unverified.

2500 (for at least 10 minutes, longer if possible)

Black Salve (Cansema) for Skin Cancer

This often caustic cream, based on a Native American recipe, separates tumors from healthy tissue. Depending on the ingredients, Black Salve may also remove precancerous tissue, skin tags, moles, and warts. It can be taken internally if made with suitable ingredients.

In mid-19th century London, Dr. J.W. Fell applied a paste of bloodroot (whose alkaloids are known tumor destroyers) and zinc chloride to his clients' tumors and eliminated cancer within four weeks. In the 1930s a United States-based doctor, Frederic E. Mohs, described his method of excising tumors with black salve in *Chemosurgery: Microscopically Controlled Surgery for Skin Cancer* (last published in 1978). The original recipe contained bloodroot and galangal. Newer versions may include burdock, chaparral, comfrey, graviola, marshmallow, and mullein.

The FDA does not allow merchants to make claims for Black Salve, even if those claims are true. Most of the companies that carry Cansema are not based in the United States, but the salve can be ordered online.

The tumorous skin area must be gently scraped or pierced before applying the salve. This allows the salve to enter the skin and do its work. Skin tumors typically emerge in one piece, with the entire root excised. The salve has been known to cause irritation to normal skin while it's killing the abnormal tumor tissue, so be careful when applying the salve. Nevertheless, people generally find the irritation minor compared to the healing that the ointment provides.

Uterine Cancer or Tumor

The cervix is the lower portion of the uterus. Symptoms include abnormal vaginal bleeding, vaginal discharge, and pain with urination or sex. Vaccine manufacturers push the theory that the Human Papilloma Virus (HPV) causes this cancer, and administer vaccines to girls as young as 9 years old. However, cervical cancer is rare, most women with HPV don't develop uterine cancer, and about 90% of HPV infections clear up on their own within two years. The primary risks for this cancer include poor diet, smoking, giving birth to three or more children, low immune function, and hormonal birth control use for more than five years.

See **VIRUSES**, "*Papilloma Virus* / Human Papilloma Virus (HPV)." Also see, under **VIRUSES**, *Herpes*, **all types**: "*Herpes simplex 1*" and "*Herpes simplex 2*." Also see "Carcinoma" and the general programs in this section, and **WOMEN**, *Uterus*, *Cervix*, *Ovaries and Fallopian Tubes*, "Pelvic Inflammatory Disease (PID)."

127 (from Dr. John Garvey), 443, 2288, sweep 2944–2968 (at least 20 minutes)

End of Cancer section.

CANCERUM ORIS

See under **ULCER**.

CANDIDA CARCINOMAS

See under **CANCER**.

CANDIDA, FUNGI, MOLDS AND YEASTS

The word “fungus” is a broad classification that includes mildew, molds, rust, smut and yeasts, as well as mushrooms, morels, puffballs and truffles. Once classified as plants, fungi share many of the same characteristics as animals—and are now considered unique enough to be placed into a separate category or kingdom. Between 70,000 and 1.5 million species of fungi are estimated to exist.

Fungi feed in three ways and are classified into three groups. The first group contains enzymes that digest the cellulose and lignin in the dead organic matter on which it grows (leaves, trees, manure, insects, animals). We call this process “rotting.” Usually, this group eventually eliminates what it eats. In the second group, parasitic fungi live in or on another organism, attacking it while causing serious damage and enormous suffering. These parasitic fungi eventually kill the hosts. The third (and relatively small) feeding group is beneficial. Its members, which may live in the soil, form a symbiotic partnership with plants (mainly trees). The tree supplies them with moisture and carbohydrates, and the fungi release minerals and other nutrients into the surrounding soil. Fungi reproduce by releasing spores that are carried elsewhere—either via the wind if they are outdoors, or via the bloodstream if they are living in a host’s body. Highly toxic waste chemicals called *mycotoxins* are carried on these spores.

Fungal infections can be difficult to eliminate, not only due to the fungi themselves but also their mycotoxins. About 25% of the population have an immune defect that prevents them from recognizing mold toxins and tagging them for excretion. Many doctors—including Ritchie Shoemaker, A.V. Costantini, Mark Bielski, Tullio Simoncini and William Crook—have found that in such individuals, fungi and their highly poisonous mycotoxins accumulate in the body and effect every system imaginable. Digestive tract disorders include diarrhea, vomiting, degeneration, and liver damage. Circulatory problems include blood vessel breakage, heart failure, inflammation of the heart muscle and blood vessels, pulmonary hypertension (inflammation of the arteries supplying the lungs), and hemorrhaging. Skin issues include rashes, burning, psoriasis, scleroderma, and photosensitivity. The reproductive tract can experience infertility and disrupted menses. Urinary tract issues include kidney stones. Respiratory tract problems can range from trouble breathing and bleeding from lungs to sinus infections. The nervous system is not exempt either. Neurological problems include tremors, headaches, loss of coordination, depression, and anxiety. Mold toxin sensitivity causes an almost unlimited number of what we call “diseases,” including adrenal disorders, AIDS, atherosclerosis, brain inflammation, cancer, Chronic Fatigue, cirrhosis of the liver, Crohn’s disease, Cushing’s disease (related to abnormally high levels of cortisol

hormone), diabetes, gout, hypoglycemia, muscular dystrophy, osteoarthritis, osteoporosis, and rheumatoid arthritis. The psychological and emotional effects of mold receive names of diseases too: Alzheimer’s, autism, depression, manic-depression, and schizophrenia. It’s incredible to think that all of these can result from mold toxins, but mold toxins are nasty, especially if their wastes remain in the body.

The majority of people with fungal/yeast issues have an overgrowth in the digestive tract. Not all fungal infections, however, are acquired through ingestion. Many people react violently to mold and mildew in the air. Reactions to mold include wheezing and other respiratory problems, nausea, severe itching and rashes, eye irritation, acute headaches, and even impaired mental function.

Mold and mildew grow easily in damp places: outside in stagnant ponds, inside buildings on plumbing pipes behind walls, in damp basements, or wherever a roof leaks. Increasing numbers of lawsuits are being filed against landlords by people in sick buildings (including schools) that are contaminated with mold. *If you live in a sick building, you must eliminate the mold in your environment! Otherwise, you may never get well!*

The presence of fungi indicates an advanced stage of fermentation within the body—the organism is literally molding—so you must pay careful attention to diet. Mold is of course present in alcoholic beverages and cheeses. Many grains—including barley, corn, sorghum, rye, and all wheat products—harbor mold too, along with peanuts and cottonseed (and its oil). Eat mostly fresh vegetables, animal protein, and good fats (coconut and olive oils, and for those who can tolerate it, raw butter). All of the organisms in the fungus kingdom, as with viruses and bacteria, thrive on sugars, even those naturally occurring in fruits. Therefore, until you have sufficiently healed, avoid fruits. Also avoid dense, high-starch carbohydrates such as grains, potatoes, carrots, peas and beans, and perhaps even nuts and seeds (which are hard to digest). Because many people with serious fungal infections develop a cross-sensitivity to yeasted and fermented foods, also avoid mushrooms, soy sauce, vinegar, alcohol, cheese, and bread-like yeasted products. Sauerkraut, even though it consists of cabbage that’s fermented, contains beneficial intestinal flora that feed on the fungi and yeasts.

Fungal infections are tenacious, so I would not rely on frequencies alone. One powerful antifungal and antiviral herb is chaparral (creosote bush), indigenous to the American Southwest and used for centuries by natives for numerous conditions. Another powerful natural remedy is the inner bark from the Brazilian pau d’arco (*Tabebuia avellanedae*) tree. Impervious to rotting in damp climates, it’s highly effective. True cinnamon, found in Ceylon and known as *Cinnamomum zeylanicum* or *Cinnamomum verum*, has antifungal (as well as antiviral and antibacterial) properties.

Take probiotic supplements, especially *Lactobacillus acidophilus* and *Lactobacillus bifidus* (also called *Bifidobacterium bifidus*), which feed on *Candida*. These lactobacilli also curb *Candida* by producing hydrogen peroxide. Sauerkraut, kefir and yogurt contain probiotics (but some people become

worse when they eat even raw fermented dairy). Read *The Yeast Connection* and *Candida: A Twentieth Century Disease*.

There are hundreds of types of fungi, so I have listed only the most common ones below. Run each frequency for at least 3 minutes, longer (5 or 10 minutes) if possible. Whatever fungus you are treating, also use frequencies for *Candida albicans*, which is widespread and is implicated in countless disorders. Some rifiers benefit by sweeping 420–482, for 15 or 20 minutes.

Recently it has become apparent that the divisions between various microorganisms are less distinct than was previously thought. Nevertheless, the conventional labeling systems are still useful. If you do not know whether the microbe belongs in **BACTERIA**, in **CANDIDA**, **FUNGI**, **MOLDS AND YEASTS**, in **PARASITES**, **PROTOZOA AND WORMS**, or in **VIRUSES**, look up its name alphabetically and you will be guided to the appropriate section.

Fermentation in the system generally supports parasites of all kinds, so see **PARASITES, PROTOZOA AND WORMS**. Because *Candida* and other fungi feed on heavy metals, see the heavy metal detoxification entries under **CHEMICAL SENSITIVITY / POISONING**. Also see **BLOOD SUGAR PROBLEMS** and **CANCER**, as fungi are often associated with these conditions. Finally, to deal with any residual brain, emotional, and psychological issues, see applicable frequencies under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

General (if you don't know what you have)

From Pulsed Technologies. Run in this order. Only one minute per frequency is needed on Pulsed Technologies equipment. You may get different results on other units.

Program 1: 35536, 38576, 58656, 58336, 42656, 36960, 36160, 32512, 30144, 59712, 56704, 56320, 55424, 50176, 49536, 49024, 47680, 47552, 46592, 39872, 38016, 37888, 35520, 33536, 32768, 59392, 52992, 47872, 44032, 43136, 41088, 30976, 56832, 40448, 33792, 52672, 52736, 52800, 52864, 52928, 53056, 42368, 43008, 37568, 48448, 56448, 56576, 56768, 35552, 49664, 49600, 36896, 36288, 51328, 50368, 46528, 37248, 59520, 54016, 36864, 40960

Program 2: 20, 72, 132, 158, 222, 242, 254, 321, 331, 333 + 523 + 768 + 786, 344 + 510 + 943, 337, 374, 391, 414, 421, 422, 464, 465, 512, 524, 555, 565, 582, 592, 594, 623, 634, 660 + 690 + 727, 732, 766, 784, 787, 802 + 1550, 822, 923, 933, 982, 743, 744, 745, 774, 784, 823 to 829, 854, 866, 880, 886, 942, 943, 1016, 1130, 1134, 1153, 1155, 1233, 1333, 1351, 1463, 1627, 1711, 1823, 1833, 2222, 2411, 2644, 4442

Mold Toxins

See "Toxins from Mold" in this section.

Actinomyces, all types

They produce hyphae (threadlike projections), so are often mistaken for fungi. See entries under **BACTERIA**.

Aflatoxin

A highly dangerous toxin produced by mold, often found in improperly stored peanuts and peanut butter. Symptoms include swelling, especially in the legs and abdomen, and liver damage. Also see "*Aspergillus flavus*" in this section.

From Dr. John Garvey: 344.

Larger set: 344 + 510 + 943, 474, 476, 568

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz: 177K and 188K

Hz: 438.74 and 466.01

Also from Clark: 9359.97, 8812.31

Alternaria tenuis

A fungus associated with lung ailments.

853 (from Dr. John Garvey), 304

Aspergillus flavus

Mold found on corn, peanuts and grain, which produces aflatoxin. Also see "Aflatoxin" in this section.

1823 (from Dr. Garvey), 364 (from Dr. Loyd), 247, 1972

Aspergillus fumigatus

Grows easily in humidity and warmth, on decomposing soil, and on starchy foods like cereals and seeds. Infects humans and a wide range of animals and plants. Indoors, it thrives on dust, potted plants, ventilation ducts, and kitchens and bathrooms. Causes the fungal infection aspergillosis. Symptoms in the sinuses include pain, headache and runny nose. In the lungs, symptoms include chest pains, difficulty breathing and a bloody cough. Infection can spread to skin, nails, ears, eyes, and (more seriously) the entire bloodstream, leading to organ failure and a complete loss of function. According to Dr. Loyd, this strain causes 90% of aspergillus infections in humans.

From Dr. Richard Loyd: 248

Aspergillus glaucus

Blue mold occurring in some human infectious processes.

524 (from Dr. Garvey), 333 + 523 + 768 + 786, 758, 1823

From Dr. Marty Monahan: 188, 216, 218, 230, 548, 976

Aspergillus niger

Common mold that may cause severe persistent infection.

10 minutes each: 374 (from Dr. Garvey), 697

Aspergillus rhizopus

Common mold that may cause severe persistent infection.

2127.5

Aspergillus terreus

Mold sometimes involved in bronchi and lung infections.

743 (from Dr. John Garvey), 743–745 sweep, 339

Aspergillus, unspecified

37.50, 357.30, 434.25, 563.19, 709.83, 978.05

Aspergillus versicolor

Common in damp indoor environments and on foods. Has a musty odor. Produces a carcinogenic toxin that also damages the liver.

488

Athelia rolfsii

Subtropical plant pathogen, also called “Southern Blight.” Can live on soil for years. Causes sudden wilting and yellowing of leaves. Stems and trunks are afflicted with round pink bumps, and stems near the soil may die.

From Dr. Richard Loyd: 559

Barley Smut

See “*Ustilago nuda* / Barley Smut” in this section.

***Blastomyces dermatitidis* / Blastomycosis**

This *Blastomyces* strain, found in Midwestern and Northern US and Canada in decaying plant material and soil, causes a chronic and invasive lung infection when inhaled, sometimes reaching the bones and skin. The frequency below is close to 1234 Hz, often used for sinus infections.

From Dr. Richard Loyd: 1233

Botrytis cinereas

Fungus that attacks over 200 plants, including tomato, cucumber, lettuce, grape, strawberry and flax, sometimes appearing as a gray mold.

1132 (from Dr. John Garvey), 212, 1545

Candida albicans

A digestive or systemic fungal infection involving the most well-known strain, *Candida albicans*, is commonly and simply called “Candida.” Candida infections cause a wide variety of symptoms: poor digestion (gas, nausea, vomiting, bloating, constipation or diarrhea); cravings for carbohydrates, sweets or alcohol; food allergies and intolerances; weight gain; chronic fatigue; mood swings, depression or anxiety; blurred vision; slurred speech; poor memory and an inability to focus; low libido; migraines; chronic sinus infections; skin rashes, jock itch or nail fungus; menstrual problems; poor motor coordination; shortness of breath, wheezing and other respiratory distress; low thyroid function; and low adrenal function.

Candida albicans usually overgrows first in the intestines, which is why digestive problems are the most common sign of infection. However, the fungus can grow anywhere. In the mucous membrane lining of the mouth, unchecked *Candida* causes a condition known as thrush. In the vagina, the itchy, burning, cheesy discharge it causes is simply referred to as a “Candida infection” or Candidiasis.

As a benign one-celled yeast, *Candida albicans* reproduces through cell division and lives in the intestinal

tract (primarily), vagina, and mouth without harming the host. But when the terrain becomes unbalanced—due to a high-sugar, high-starch diet; infectious illnesses; medications (antibiotics, birth control pills, cortisone); and emotional and physical tension (causing the production of excess stress-inducing cortisone)—*Candida* changes into a more complex fungal (mycelial) form and proliferates. The fungus produces spores and grows hyphae, long root-like stalks that attach to their food source: you!

The changes *Candida* undergoes are usually triggered in the digestive tract. Under optimal conditions, the friendly gut flora *Lactobacillus acidophilus* and *Lactobacillus bifidus* prevent *Candida* from changing form and multiplying. But when those flora decrease in number, *Candida* flourishes and morphs. The fungal stalks puncture the intestinal walls, causing abnormal tears. This damage enables partially digested food to escape the intestine, circulate in the bloodstream, and poison and inflame the tissues—a condition commonly known as leaky gut.

Candida causes additional damage due to the dangerous chemical wastes it excretes. According to Dr. William Crook, at least 79 different toxins are released as byproducts of the fungus’s metabolism. One toxin is alcohol, created when the fungus ferments sugars in the gut or bloodstream. (Alcoholic beverages are created by adding yeast to grain or fruit, upon which it feeds—resulting in the excretion of a highly prized, toxic waste product.) Alcohol breaks down further into acetaldehyde, an even more potent toxin chemically related to formaldehyde, a fluid used to embalm corpses. Acetaldehyde interferes with neurotransmitter pathways, immune response, metabolism, and nervous and endocrine systems. The tendency of acetaldehyde to accumulate in the brain, spinal cord, joints and muscles is what creates such a wide variety of debilitating symptoms. The *Candida* spores and mycotoxins that get dumped into the bloodstream and circulate freely to every tissue, harm us as much as the *Candida* stalks that puncture the gut.

With localized and especially systemic infections, a multifaceted approach is necessary because the fungus can be so difficult to eliminate (see Insert, “Holistic Protocols to Help Eliminate *Candida albicans* and Its Toxins”). The fungus must be killed. Its mycotoxins must be excreted. The leaky gut needs repair. Nutrients must be replenished. And the body’s vitality must be restored. *Candida* also feeds on mercury, so check for heavy metals and remove them. See **CHEMICAL SENSITIVITY / POISONING** for details.

In addition to taking supplements that disable *Candida* and neutralize its toxins, eat food that nourishes you and not the fungus. This means a diet moderate in animal protein, high in non-starchy vegetables, and moderate in good fats. Don’t eat grains or fruits, at least for the first several months. Some people can handle nuts and seeds, but in moderation.

Important *Candida albicans* research was conducted in Romania under the auspices of Jimmie Holman and Paul Dorneanu. They found that 464, a number commonly

Holistic Protocols to Help Eliminate *Candida albicans* and Its Toxins

Attack Pathogens Directly and Support Immunity.

- ◆ **Frequencies.** In 2008, lab technicians in Romania, under the direction of Jimmie Holman and Paul Dorneanu, cultured *Candida albicans* in Petri dishes and bombarded the fungus with dozens of frequencies. Chapter 5 lists the pathogen-killing frequencies (most in the 50 KHz range and higher) in descending order from “excellent” to “very good,” according to the percentage of *Candida* killed from one exposure. Keep in mind that Holman and Dorneanu used equipment from Pulsed Technologies. If your unit cannot transmit very high MORs, Jeff Sutherland advises using square waves, which produce the widest range of harmonics, and setting the unit for a 10% duty cycle.
- ◆ **Colloidal Silver (CS).** Silver is well known for its ability to destroy microorganisms and restore immune function. To eliminate *Candida* in the digestive tract, drink CS on an empty stomach so it can travel straight to the large intestine where *Candida* resides. If you experience too much discomfort due to microbial die-off, you may have to begin with a teaspoon or less and gradually increase the amount. (Some people, though, can drink a glass of CS or more at one time.) Because CS can kill beneficial bacteria as well as pathogens, take the CS in the morning and afternoon, and replenish the gut flora at night with probiotics (see next column). If you plan to take lots of colloidal silver, buy a CS maker. (See Chapter 3, **Colloidal Silver** for details on silver, and Appendix A for generator sources.)
- ◆ **Ozone.** Ozone supports immune function and kills pathogenic microbes without harming healthy tissue or beneficial flora. You can drink ozonated water, take ozone saunas, or insufflate. (See Chapter 3, **Oxygen Therapies**.)
- ◆ **Probiotics (Friendly Flora).** *Lactobacillus acidophilus* and *Lactobacillus bifidus* eat *Candida*.
- ◆ **Herbs and Essential Oils (EOs).** Antifungal herbs include chaparral, pau d’arco, clove, tea tree, olive leaf, and oregano. Olive leaf, *Boswellia serrata*, and chaparral are anti-inflammatory. Essential oils taken internally should be labeled as food or therapeutic grade. Dilute them in an edible “carrier” oil such as olive, coconut, or sesame. Take them in safe amounts; read *Essential Oil Safety* by Tisserand.
- ◆ **Grapefruit Seed Extract.** Potent, effective antiviral, antibacterial, and antifungal. The only chemical-free brand is NutriBiotic®. Follow directions on bottle.

Neutralize Toxins and Provide Nutritional Support.

- ◆ **Pantothenic Acid (Vitamin B5).** Among other functions, neutralizes the alcohol-rich *Candida* toxins. Take 450 mg daily, at one time.
- ◆ **Biotin (Vitamin B7).** Helps the body metabolize proteins, fats and carbohydrates; controls blood sugar levels; and prevents *Candida* yeast from changing into its fungal form. Take 1000 mcg (1 mg) 3–4 times a day. Amounts may need to be increased, based on individual need. Consult your doctor.
- ◆ **Probiotics: *Lactobacillus bifidus* (*Bifidobacterium bifidus*) and especially *Lactobacillus acidophilus*.** These friendly flora feed on *Candida* and further suppress it by excreting hydrogen peroxide (see Chapter 3, **Oxygen Therapies**). They also produce biotin, in whose presence the *Candida* yeast cannot transform into a fungus (see above). Until the fungus is under control, take double the amount listed on the label, or 1 gm daily. After that, take 500 mg daily.
- ◆ **Probiotic: *Saccharomyces boulardii*.** This anti-inflammatory tropical yeast competes with *Candida* for space in the intestinal tract (and wins), but leaves the system once supplementation stops. It secretes proteases (protein-digesting enzymes) which reduce the output of cytokines (inflammatory chemicals) that the host produces in response to the *Candida*. *Saccharomyces boulardii* also secretes *capric acid*, which inhibits the formation of hyphae (as well as biofilm somewhat)—thus deterring *Candida* from adhering to and puncturing the intestinal lining. However, with a very leaky gut, even friendly flora can invade the bloodstream and cause damage, as they belong in the gut and not the blood. Richard Loyd reports this occurring with *Saccharomyces boulardii*.
- ◆ **Activated Charcoal.** This porous powder attracts and traps many poisons and toxins, including the acetaldehyde wastes from *Candida*. AC is completely safe, but take it with water to prevent dehydration and constipation. The usual amount is 1 teaspoon with every 8 ounces of water, followed by 8 ounces more. For details, see Chapter 3, **Detoxification**.
- ◆ **Magnesium.** Assists in the intercellular transport of nutrients. Most people are deficient in this mineral.
- ◆ **Molybdenum.** This trace mineral is used in the detoxification of acetaldehyde, a potent mycotoxin excreted by *Candida*. Stubborn cases may require 100 mcg (one-tenth of a mg) three times daily until acetaldehyde poisoning symptoms subside.
- ◆ **Acetaldehyde Detox (by rifting): 3103032.511 Hz**

found on Rife frequency lists, is a subharmonic of *Candida*'s Mortal Oscillatory Rate. Just a 3-minute exposure to 464 (on their own equipment) retarded *Candida* growth by about 20%. The actual MORs (below), if your unit can reach that high a range, are ideal. (Holman and Dorneanu also identified another *Candida* strain similar to *albicans*, detected only by a complex, expensive test. Although its frequencies may be different from those of *Candida albicans*, treating for the *albicans* strain might still benefit.)

Pulsed Technologies's lab-tested killing frequencies are powerful; so run half of them on days 1, 3, 5, 7, etc., and the other half on days 2, 4, 6, 8, etc. *Begin with brief sessions if you're heavily infected*, because your body may not be able to quickly enough detoxify the acetaldehyde that's released by the *Candida*.

Also try **PARASITES, PROTOZOA AND WORMS**, "General (unspecified)" and "*Ascaris lumbricoides* / Roundworm," as *Ascaris* and *Candida* often co-exist.

From Jimmie Holman. Deliver frequencies in precisely the order written. Note that they might not work on units other than those manufactured by Pulsed Technologies:

Excellent to good results, in descending order: 23485, 51155, 51156, 53940, 58914, 58916, 88740, 23484, 31724, 31725, 33060, 46980, 50460, 54404, 54405, 55250, 57420, 99180, 22620, 29580, 55251, 60900, 64380, 67860, 78300

Organ support (from Jimmie Holman), immediately before or after the above numbers: 23958, 24354, 28251, 29766, 32121, 32670, 36735, 38281, 44506, 44583, 45549, 45738, 54531, 56133, 56376, 57519, 58806, 63336, 67977, 71874, 84942, 86394, 87K, 89298

For units unable to reach the higher ranges: 414 (from Dr. John Garvey), 412, 464, 866

From Dr. Richard Loyd: 574, 386K, 3088K

From Dr. Hulda Clark: 19217.81, 956.80

Also try: 23485 and 8146. Sweep: 12006.25–12137.5

Candida auris

Discovered in 2009 but difficult to identify with standard lab equipment, this fungus is resistant to antifungal drugs. It is becoming a health threat in hospitals and nursing homes where people already have other serious health issues, are receiving lots of antibiotics, and are hooked up to feeding tubes, catheters, or other types of tubes. Symptoms include fever, chills, infections and wounds in many other parts of the body, and even death.

From Dr. Richard Loyd: 563, 574, 888

Candida carcinomas

A malignant tumor encased in connective tissue accompanied by *Candida*. In addition to the frequencies below, see "*Candida albicans*" in this section, and follow the protocol carefully to eliminate both the fungus and its mycotoxins.

465, 2167, 2182

Candida glabrata

Present in the immune compromised, it easily develops resistance to antifungal drugs. Causes infections in people with feeding and other tubes, poor kidney function, and those who have had surgery and received other drugs.

595

Candida krusei

Occurs fairly often in urinary tract and other infections, including in the brain.

From Dr. Richard Loyd: 698

Candida parapsilosis

Causes sepsis, a potentially life-threatening condition that occurs during an infection. The body releases an abnormally high level of inflammatory chemicals into the bloodstream. This yeast also infects the digestive tract.

From Dr. Richard Loyd: 634

Candida robusta

Very rare, but observed in pregnant women. Causes vaginal itching and discharge. Other *Candida* strains have been reported to cause miscarriage. Antibiotics can interfere with the microbiome of the fetus and contribute to nervous system damage, leading to ADHD and autism; so be careful about taking pharmaceuticals while pregnant.

468

Candida rugosa

Another newly discovered fungus. Because it's resistant to antifungal drugs, one might surmise that (as with many of the previous *Candida* entries here) it has emerged as a result of too many pharmaceutical drugs, administered to too many people and too often, for the common *Candida albicans*. Fortunately, we have holistic alternatives.

588

Candida tropicalis

Implicated in Crohn's disease, inflammation of the bowel. 1403 (from Dr. John Garvey), 675, 709, 2182, 2184

Cladosporium fulvum

A fungus that causes raised, irregular nodules of soft tissue that can be slow to heal.

233, 344 + 510 + 943, 438 (from Dr. John Garvey), 776

***Claviceps purpurea* / Ergot**

Found in contaminated wheat, oats, rye, triticale, barley, and other grasses and grains, it causes ergot in humans and animals, especially cattle. Symptoms include vomiting, diarrhea, abdominal and muscular pain, headache, muscle tremors, psychotic behavior, convulsions, and coma.

660 + 690 + 727

From Dr. Hulda Clark: 295K or 731.23 (for units unable to reach the KHz range), and 14687.19

***Coddidioides immitis* / Valley Fever /
Coccidioidomycosis / Coccidiosis**

The seeds and spores from *Coddidioides immitis*—a fungus-like mildew living in warm-climate soil—are spread by the wind after the earth is dug. Those living in the US Southwest are most affected as new homes and roads are constantly being built that disrupt the soil. Infection commonly reaches the lungs, causing flu and pneumonia. Sometimes the disease is fatal, when the spores spread through the bloodstream to the membranes surrounding the brain, causing meningitis. Valley Fever cannot be caught from people. After one exposure, immunity may develop. The following frequencies are from Michael Tigchelaar: 80K (for 40 minutes), 336 and 337 (for 5 minutes each)

Collectotrichum

Pathogenic fungi in tropical and sub-tropical regions. It causes diseases in cereals, legumes, vegetables and fruits, including mango, coffee, avocado, and yam.

1482

Corn Smut

See “*Ustilago maydis* / Corn Smut” in this section.

Cytochalasin B

A mycotoxin that penetrates cell membranes and inhibits cellular processes. Used by chemists and researchers.

77K, 91K

***Cryptococcus neoformans* / *Cryptococcus gatti* /
Meningoencephalitis**

This yeast causes respiratory infections, sometimes entering the brain and causing meningoencephalitis infection. Symptoms include headache, nausea, staggering gait, irritability, confusion, and blurred vision.

588, 636 (both from Dr. Richard Loyd), 367, 428, 444 + 1865, 476, 478, 522, 579, 594, 597, 613, 624, 785, 792, 872, 1211, 5880, 5884

Dematium nigrum

Soil fungus found in wounds, often appearing as an infected patch of skin.

243 (from Dr. John Garvey), 738

Epicoccum

Mold found in air, soil and foods, sometimes animals and textiles. Causes spots in various plants.

From Dr. John Garvey: 734

***Epidermophyton floccosum* / Athlete's Foot / Jock Itch**

Epidermophyton floccosum attacks skin, nails and feet (where it's called athlete's foot), and the groin (where it's called jock itch). Fungi that attack skin are often interchangeable and do not confine themselves to one area; so also see the *Trichophyton*, *Microsporon* and *Microsporum* (and additionally *Candida albicans*, for jock itch) in this section.

644, 766 (both from Dr. John Garvey), 856 (from Dr. Richard Loyd), 20, 345, 465, 634, 660 + 690 + 727, 784, 802 + 1550, 880

Ergot

See “*Claviceps purpurea* / Ergot” in this section.

Fungus flora

Some from Dr. Garvey: 331, 336, 555, 587, 632, 688, 757, 882, 884, 887

Funneliformis mosseae

Discovered by Fry Labs of Scottsdale, Arizona, US, this pathogen is found in 81% of mosquitoes in Arizona. It infects red blood cells, and can cause severe iron deficiency anemia. The mature form produces copious amounts of thick biofilms in a short period, and is reported to live on dietary fats. Symptoms include capillary inflammation and reduced blood flow, which can lead to other infections.

The biofilms can harbor many pathogens, so address other microbial infections too. *Mimosa pudica* (“sensitive plant”) has been found to eradicate this parasite.

From Dr. Richard Loyd: 514, 515, 516, 517, 518, 519, 520, 521, 1260, 1583, 1705

Fusarium oxysporum

Fungus causing inflammation of the cornea of the eye.

102, 332, 705, 780, 795

Also try: 600 + 625 + 650, 746, 768

Geotrichum candidum

Fungus found in feces and dairy products that causes symptoms similar to those of *Candida albicans*.

350, 355, 384, 386, 403, 404, 407, 409, 410, 412, 415, 418, 543, 544, 687, 700, 737, 987, 988

***Gliocladium* / Brain Fungus**

855 (from Dr. John Garvey), 469, 633

***Histoplasma* / Histoplasmosis**

A fungus found mainly in tropical countries bird and bat droppings, causing infections in the lungs and elsewhere.

424, 616, 749

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 293300 (lowest), 302K (optimal), and 304350 (highest)

Hz set: 727.02 (lowest), 748.58 (optimal), and 754.41 (highest)

Also from Clark: 15035.69

Hormodendrum

Airborne, causes respiratory problems and allergies.

695 (from Dr. John Garvey), 532, 627, 663, 678

Mold and Lyme Toxins, and the Inflammation Response

A Common Problem. Mold toxins are one of the reasons that there are so many mysterious conditions that baffle the medical community. An understanding of this material can easily double the effectiveness of any practitioner who is not already helping their clients to remove mold toxins from their bodies and environments. Mold toxins, the most common of the biotoxins, are neurotoxins (toxic to nerves). They are also responsible for many (or most) of the symptoms in people with Lyme.

Where Mold Is Found. After studying thousands of homes, Harvard University researchers found that 50% of them had enough mold toxins in them to cause symptoms, even though most had no obvious water damage and little or no mold was actually visible. About half of the people in the United States are living in homes that contain enough mold toxins to cause illness. They are given the name "Sick Building Syndrome." Buildings with flat roofs, and those on a concrete slab or with a concrete basement, are ready-made for mold problems. Flat roofs leak, and concrete whisks small amounts of water up into the walls. Any natural fibers, such as wood cellulose or sheetrock paper, that are exposed to moisture or water vapor, will start to make mold spores. There may not be enough mold to damage the building, but there is certainly enough to cause serious illness. Attached garages are also problematic.

Almost all cars have enough mold to make people sick—even cars that are only a few weeks old. We drive them in the rain, open the doors in the rain, and open the trunk in the rain. If your car has been driven in the rain, it is almost certainly moldy. A car or building does not have to smell musty or have visible mold to be contaminated. A musty smell is an indication that mold levels are very high, although not everyone is able to smell mold.

Mold toxins are also found in foods such as grains and peanuts, although far more serious are the mold toxins in buildings and vehicles with water leaks. The major molds likely to start colonies are *Stachybotrys*, *Aspergillus*, *Acremonium*, *Actinomyces*, *Penicillium* and *Chaetomium*. The colonies may be visible, or hidden in places such as the tops of ceiling tiles or the bottoms of carpets. The molds send out spores, which contain powerful biotoxins that affect the nerves (neurotoxins).

The Body's Mold Detection Mechanism. When these spores with their neurotoxins are inhaled, about 75% of the population can make antibodies to the toxins and quickly eliminate them. They may sneeze, have a sore throat or have other minor symptoms, but symptoms are temporary. If they spend several days in a moldy building, they may begin to feel sick, but when they are away for a few days they recover. Their bodies are like a plastic bucket that has poison drip into it from time to

time: they have a small hole in the bottom of the bucket, so the poison is able to leak out.

The problem is, about 25% of the population have a genetic makeup that's the equivalent of not having a hole at the bottom of the bucket. They don't produce antibodies for mold toxins, meaning the body cannot tag the toxins as invaders or eliminate them. Although the liver does recognize mold toxins and dumps them into the bile to be excreted via the digestive tract, the job of making antibodies to mold is done by the immune cells, not the liver. So people unable to detox from mold have immune issues that liver support cannot fix.

Bile is recycled in the body. So unless a binding agent (activated charcoal or zeolite) is used in the digestive tract, mold toxins are quickly reabsorbed back into the blood, and they accumulate with continual or repeated exposures. Around 25 million Americans have some degree of mold toxin illness, though it might be called MS, Parkinson's, chronic fatigue, fibromyalgia, rheumatoid arthritis, and so on.

The Many Symptoms of Mold Illness. These mold toxins cause chronic inflammation, with almost too many symptoms to list. They include fatigue, severe pain, brain fog, out of control weight gain, blood sugar problems, nerve damage, cancer, reduced circulation, autoimmune diseases, symptoms that resemble advanced heart disease, and even loss of sex drive. Some people feel as though they have a permanent case of the flu.

About 10 million American children are being exposed to mold toxins (many are medicated with Ritalin as a result), and around 25 million Americans have some level of mold toxin illness. Many cannot detoxify either mold or Lyme toxins; so if they have Lyme disease, Lyme toxins also build up in the body. These are the people that get very sick and stay sick when they do frequency treatments for Lyme. *For those who get major prolonged die-off reactions, frequency treatments for Lyme, or any other protocols that target the Lyme, are not recommended until the toxin issue is addressed.*

The Biochemistry of Mold Illness. Mold and Lyme toxins attach to fat cells, causing them to continually release inflammatory cytokines. When one has the flu, symptoms are not caused directly by the viruses; they are caused by the resulting cytokines. So, mold and Lyme toxins can cause symptoms similar to a permanent case of flu.

Inflammation is useful to help deal with an infection. But it's damaging when it continues indefinitely. The mold and Lyme toxins cause the fat cells to make a material called NF-kappaB. NF-kappaB causes the release of all kinds of inflammatory chemicals, which have great adverse effects—as mentioned above—if they are produced over a long period of time.

Likewise, some of these inflammatory chemicals cause increases in NF-kappaB! An analogy is when you turn up an amplification system too high and get feedback from the microphone and speaker, resulting in a very loud, unpleasant squeal. Similarly, the body can get stuck in a feedback loop where NF-kappaB increases inflammatory chemicals, which increase NF-kappaB, which increases inflammatory chemicals, and so on.

Cytokines cause the release of an enzyme called MMP9 (matrix metalloproteinase 9) that causes severe nerve pain. Excess cytokines are related to autoimmune problems. And cytokines reduce circulation in small blood vessels, decreasing the levels of oxygen and nutrients that can get into the cells. This acts similarly to advanced heart disease. Any exercise can result in a crash that lasts for days.

People harboring mold and Lyme toxins can make antibodies to myelin, with resulting nerve damage (which is why people with Multiple Sclerosis should be checked for mold and Lyme toxins). They may also make antibodies to a cardiolipin (a component of the mitochondrial membrane), which causes blood to sludge, thereby causing hands and feet to get cold. They often make antibodies to gliadin, a protein found in gluten, resulting in an inability to tolerate glutinous grains (wheat, rye, barley). A diet high in sugar and in the starch amylose (wheat, rye, oats, barley, rice, root vegetables, and bananas) causes rapid blood sugar and insulin spikes.

These inflammatory chemicals pass the blood-brain barrier and block various receptor sites. When the leptin receptor sites are blocked, leptin levels increase, causing leptin resistance. Leptin is the hormone involved in fat regulation; so excess leptin packs fat into fat cells, where it remains until the toxins are removed. People with high leptin levels can gain weight eating 1,000 calories a day.

Ordinarily, the pituitary gland produces MSH, or melanocyte-stimulating hormones. But when leptin receptors are blocked, the production of MSH is also blocked. Once MSH is low, the pituitary will produce little or no melatonin, resulting in sleep problems. Endorphins will also be low, causing excess chronic pain. Low MSH also means a loss of control of other hormones. If cortisol is low, treatment should be to remove the neurotoxins. Supplementing with cortisol or steroid drugs is not a solution while biotoxins levels are high, as this will depress production of ACTH (adrenocorticotropic hormone) by the pituitary. Not only will the person's health become much worse, but there may be serious, permanent injury. Finally, low MSH can result in low androgens in both men and women. If androgens are low, symptoms will be much worse. This may be why most people with chronic fatigue are women.

Anti-diuretic hormone production by the pituitary is often disrupted, resulting in excess urination even to the point of dehydration, with excess thirst and excess salt in the blood. There may also be a layer of salt on the skin, making the person a good conductor of electricity. This is why many patients have problems with static electricity shocks. They also may damage electronic equipment by touching it.

People who are low in MSH often have leaky gut, which lets in gliadin, which causes more inflammation and further reduces MSH, which causes more leaky gut, which lets in more gliadin. Often, what is diagnosed as Irritable Bowel Syndrome or Crohn's disease is a response to toxins from mold and Lyme. Furthermore, 80% of people low in MSH also have colonization in their sinuses by a variety of bacteria called "multiply antibiotic-resistant coagulase negative *staph.*" In most people, this organism is fairly benign. But in those with low MSH, this organism must be taken care of before they can feel good. A sinus wash of colloidal silver can help.

Therapies for Mold and Lyme Toxins. Ritchie Shoemaker, MD, recommends a diet low in starch. To bind the toxins in the gut and escort them out, he suggests the prescription drug Cholestyramine. However, I have observed that in most people, Cholestyramine causes digestive problems, including bloating and constipation. So instead, I use a plant sterol product called Cholestepure. People take 2 capsules three times a day, with few or no negative effects and very good results. Additional substances for biotoxin removal include peach tree extract and thuja, taken for one to two months. We also offer our own herbal formulas.

An ionic foot detox bath, where the feet are in separate tubs, is highly effective and works quickly. [See Appendix H for plans to make one for about ten dollars.] At least one type of Japanese foot detox patch, which contains herbs and is worn on the foot at night, works very well with no apparent adverse effects. We are seeing amazing improvements in as little as one week.

About 1% to 2% of the population does not get adequate improvement just by reducing mold and Lyme toxins. To lower inflammatory cytokines, leptin and MMP9, and to reduce inflammation, we have used a number of products such as Metagenics UltraInflamX, Kaprex and Kaprex AI, Biotics KappArest, and our own herbal formulas. The supplements with "kap" in their names inhibit NF-kappaB. Homeopathics for mold and Lyme could also help. If the molds are causing additional infection, anti-bacterial, anti-viral and anti-fungal herbs can be used, along with a supplement of many strains of beneficial intestinal flora.

Make sure to avoid moldy places and moldy foods.

—adapted from Richard Loyd, PhD, 2007 and 2014
royalrife.com/mold_toxins.pdf

See the Antimicrobial Essential Oil Blend Recipe on page 693.

Malassezia furfur / Microsporon furfur / Tinea Versicolor

Both *Malassezia furfur* and *Microsporon furfur* cause Tinea Versicolor, a skin condition usually appearing on the front of the chest. Symptoms include scaling, reddish or gray itchy patches, and dry brittle hair. The frequencies for Tinea Versicolor are not separated according to microbe. Also see the various *Trichophyton*, *Microsporum*, and *Microsporon* entries, all in this section.

222, 225, 491, 616, 700

Microsporon audouini / Ringworm

The common fungus *Microsporon audouini* causes Ringworm. Symptoms are itching, pain, and roundish red rings and flaking on the skin and scalp. Also see “*Malassezia furfur* / *Microsporon furfur* / Tinea Versicolor” and the various *Trichophyton*, *Microsporum*, and other *Microsporon* entries in this section.

From Jimmie Holman of Pulsed Technologies. Deliver frequencies in precisely the order written. He advises that they might not work on non-Pulsed Technologies units:

90K, 83840, 83375, 81920, 81290, 74062.5, 68K, 65875, 65625, 62845, 61638.75, 59562.5, 57500, 52480, 51465, 51200, 48K, 47600, 47410.63, 46812.5, 45K, 41920, 41687.5, 40960, 40645, 37031.25, 34K, 32937.5, 32812.5, 31422.5, 30819.38, 29781.25, 28750, 26240, 25732.5, 25600, 24K, 23800, 23705.31, 23406.25

Short set: 422, 831, 1222 (all from Dr. Garvey), 285

Microsporum canis / Ringworm in Humans and Dogs

Another common fungus in dogs, cats and humans that causes Ringworm. Symptoms are itching, pain, and roundish red rings and flaking on the skin and scalp. Also see “*Malassezia furfur* / *Microsporon furfur* / Tinea Versicolor” and the various *Trichophyton*, *Microsporum*, and other *Microsporon* entries in this section.

1644 (from Dr. Garvey), 347, 402, 600 + 625 + 650, 970

Microsporum, other types

Also see “*Malassezia furfur* / *Microsporon furfur* / Tinea Versicolor” and the various *Trichophyton*, *Microsporum*, and other *Microsporon* entries in this section.

158, 222, 242, 391, 512, 523, 565, 592, 594, 623, 745, 774, 933, 1016, 1130, 1155, 1333, 1463, 1627, 1833, 4442

Mold, Unspecified (from Dr. John Garvey)

222, 333, 421, 822, 1233, 1351, 1711, 1832

Monilia

See “*Candida albicans*” in this section.

Mucor mucedo

A mold that causes rot in fruit and baked goods and is sometimes found on the feet and skin.

612 (from Dr. John Garvey), 488, 735, 766, 1K, 9788

From Hulda Clark: 288K or 713.88 (for units unable to reach the KHz range)

Mucor plumbeus

Similar to *Mucor mucedo* and *Mucor racemosus fresen*.

361, 578, 785, 877

Mucor racemosus fresen

Grows on decaying vegetation and bread, and can cause ear infections. According to Dr. Guenther Enderlein, it's implicated in most, if not all, coronary conditions.

First try: 474 (from Dr. John Garvey), 310, 875

Also try: 473, 686, 713, 729, 731, 751, 760, 778, 871, 873, 876, 878, 887, 1200, 7768, 7976, 8788

Mucormycosis / Zygomycosis

A serious fungal infection often associated with uncontrolled diabetes or immuno-suppressive drugs. See the other *Mucor* frequencies in this section. Also see **BLOOD SUGAR PROBLEMS**.

942 (from Dr. John Garvey), 623, 733

Neurospora sitophila

A “pink mold” fungus that can provoke allergic reactions.

705, 878

Nigrospora

Fungus involved in lung, sinus, TB infections, and allergies.

302, 350, 764

Nocardia asteroides / Nocardiosis

Transmitted mainly through soil. Symptoms include lung abscesses, fever and cough that can last several months, heart damage, and brain lesions leading to meningitis.

228, 231, 237, 694, 719, 794, 887, 2890

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 354950 (lowest), 355100 (optimal), and 355350 (highest)

Hz set: 879.83 (lowest), 880.20 (optimal), and 880.82 (highest)

Also from Clark: 17679.39

Oat Smut

See “*Ustilago avenae* / Oat Smut” in this section.

Oospora / Powdery Mildew

Often appears on cultivated and wild grasses. It harms rice and potato crops; unknown if it harms humans.

5346, 9599

Puccinia graminis / (Wheat) Stem Rust / Black Rust

Destructive fungus that causes tissue damage in wheat.

643

Rhizopus nigricans* / *Rhizopus stolonifer

Common bread mold/fungus that lives on decaying fruit and in soil, sometimes infects humans and other mammals, and is used in the manufacture of cortisone. 132 (from Dr. Garvey), 327, 659, 660 + 690 + 727, 775

Ringworm

See “*Microsporon audouini* / Ringworm” in this section.

***Rhodotorula mucilaginosa* (formerly *rubra*)**

Yeast causing mostly eye infections in humans and animals. 674, 598, 778 (all from Dr. Loyd), 833 (from Dr. Garvey)

Slime Molds

Agylla: 81K *Lycogala*: 126K *Stemonius*: 211K

Sorghum Smut

See “*Sporisorium sorghi* / Sorghum Smut” in this section.

***Sporisorium sorghi* / Sorghum Smut**

294

Sporobolomyces

Fungus in humans, mammals, birds, soil and plants, causing allergies, respiratory infections, and dermatitis. 700, 753

Sporotrichum pruinosum

A common fungus that causes allergies, especially in those with chemical sensitivity. 584, 598, 687, 715, 755

Stachybotrys chartarum

Among the most toxic of all fungi. Symptoms include irritation, pain and inflammation of the mucous membranes in the nose, mouth and throat; cough; bloody nasal discharge; burning in eyes; skin rash; impaired immunity; headache; fatigue; hemorrhage; nervous disorders; shock; and even death.

Stachybotrys can grow indoors in the kitchen, bathroom, basement and other damp areas, causing “sick building syndrome.” Houses without basements are susceptible, as cement foundations are rarely sealed, and moisture can seep from the ground through the first floor. Warmth, dryness, and good ventilation prevent mold. If you see black mold spreading, the walls may need to be replaced. Bleach is often used on buildings, but it is not a good choice because its alkalinity helps pathogens regrow and bleach is toxic to humans and animals.

Conventional medicine uses antifungal drugs to eliminate infections in humans and animals, but essential oils work better and are much safer (see Sidebar, “Antimicrobial Essential Oil Recipe”). Both ozone and chlorine dioxide (sold as the product “MMS”) are effective for personal detox as well as for building purification (see Chapter 3, **Oxygen Therapies**).

Antimicrobial Essential Oil Recipe

An astoundingly large number of essential oils (EOs) have potent antifungal (as well as antibacterial and antiviral) properties. The ones below do a great job of eliminating mold spores in an indoor space (plus, they have a pleasing and uplifting scent). Diffuse all of them together for about three days in an ultrasonic aromatherapy diffuser, which doesn’t use heat. (Heat destroys the delicate compounds in the oils.) Repeat if necessary. People have reported, and scientific studies confirm, that these oils completely kill mold. You’ll still see the outlines of the molds on the surfaces where they were growing, but the molds will not be active.

These oils can usually be safely inhaled, reducing or eliminating respiratory infections, coughing, and wheezing after brief inhalation periods.

The first five EOs below are in a popular commercial blend. However, you can make your own formula much more economically by buying the individual oils and mixing them yourself. Amounts are approximate.

- ◆ **Clove Bud** (*Syzygium aromaticum*): 200 drops
- ◆ **Lemon** (*Citrus limon*): 200 drops
- ◆ **Cinnamon Bark** (*Cinnamomum verum*): 150 drops
- ◆ **Eucalyptus** (*Eucalyptus radiata*): 100 drops
- ◆ **Rosemary** (*Rosemarinus officinalis*): 50 drops
- ◆ **Optional: Oregano** (*Origanum vulgare*), **Tea Tree** (*Melaleuca alternifolia*), **Thyme** (*Thymus vulgaris*): 50 drops of each oil you want to include

Experimental: 540.1, 577.9, 604.4, 747.4, 764.5, 765.6, 844.0, 922.2, 952.4, 969.6

Sterigmatocystin

A toxic metabolite related to aflatoxins. 88K, 96K, 133K, 126K

Stemphylium

Fungus that lives in soil and decaying plant material and is a well-known allergen. 461 (from Dr. John Garvey), 114, 340

Thrush

Ulcerous white patches in the mouth caused by *Candida albicans*, often accompanied by fever and gastrointestinal disturbance. Also see other entries in this section. 414, 464, 465, 660 + 690 + 727, 787, 880

***Tinea unguium* / Onychomycosis**

Tinea unguium causes Onychomycosis, the most common finger and toenail infection. (Toenails may also harbor *Tinea interdigitale*.) Infection begins at the free end of the nail, gradually spreading to the entire nail which loses its

luster and becomes brittle and opaque. Soak the nail in castor oil to help eliminate the infection.

From Dr. James Bare: 5042 (sweep 9 Hz on either side of the main signal), 8111, 12800

Torulopsis glabrata

A yeast sometimes appearing in vaginal infections. Also see “*Cryptococcus neoformans*” and other fungal forms in this section.

From Dr. John Garvey: 522, 2121

Toxins from Mold

In about 25% of the population, the immune cells cannot recognize or tag the toxins. So the body cannot excrete them. Even if molds and fungi are killed, their waste products remain in the body, impeding its function and preventing other conditions from healing. If you suffer greatly from exposure to mold and mildew, you’ll need “Holistic Support to Help Eliminate *Candida albicans* and Its Toxins” (see Insert, page 687). Also see Appendix H, “Create a Detox Footbath for Ten Dollars.”

Acetaldehyde (excreted by *Candida albicans*): 3103032.511 40K (for as long as desired; helps revitalize cells)

Trichoderma viride

A mold found in tropical countries.

711

Trichophyton mentagrophytes

Usually attacks the feet, skin and nails, causing itching, inflammation, sometimes burning, and skin flaking. Fungi that attack the skin can be interchangeable and don’t necessarily confine themselves to one area. Also see *Microsporon*, *Microsporum*, other *Trichophyton* entries, and “General Fungus / Molds / Yeasts” in this section.

311 (from Dr. John Garvey), 414

Trichophyton rubrum

On the feet, nails and groin (rarely the scalp), causing itching and scaling. Fungi that attack the skin can be interchangeable and don’t necessarily confine themselves to one area. Also see *Microsporon*, *Microsporum*, other *Trichophyton* entries, and “General Fungus / Molds / Yeasts” in this section.

From Dr. John Garvey: 752, 923

Trichophyton tonsurans

Grows on scalp, body and sometimes nails, causing itching and scaling. The fungi that attack the skin can be interchangeable and don’t necessarily confine themselves to one area. Also see *Microsporon*, *Microsporum*, other *Trichophyton* entries, and “General Fungus / Molds / Yeasts” in this section.

765 (from Dr. John Garvey), 454

***Trichophyton* (unspecified)**

Fungi that attack the skin can be interchangeable and don’t always stay in one area. Also see *Microsporon* entries, *Microsporum* entries, other *Trichophyton* entries, and “General Fungus / Molds / Yeasts” in this section.

First try: 132, 812, 2422, 9493 (all from Dr. John Garvey), 133, 381, 585, 593, 725, 808

Also try: 142, 373, 376, 378, 385, 387, 420, 425, 428, 576, 578, 580, 581, 583, 584, 587, 588, 592, 595, 597, 644, 724, 726, 732, 733, 738, 748, 750, 765, 766, 771, 777, 778, 779, 794, 797, 801, 805, 809, 817, 886, 1256, 6887, 7688, 7697, 7885, (from a Belgian researcher) 906

Tropical *Candida*

See “*Candida Tropicalis*” in this section.

***Ustilago avenae* / Oat Smut**

Causes rotting in oat plants.

806

***Ustilago maydis* / Corn Smut**

Causes rotting in corn plants, primarily in sweet corn.

From Dr. John Garvey: 546

***Ustilago nuda* / Barley Smut**

Causes rotting in barley plants.

From Dr. John Garvey: 377

***Ustilago tritici* / Wheat Smut**

Causes rotting in wheat plants. Has an odor of dead fish.

156, 375, 10163

Wheat Smut

See “*Ustilago tritici* / Wheat Smut” in this section.

Wheat Stem Rust

See “*Puccinia graminis* / Wheat Stem Rust / Stem Rust / Black Rust” in this section.

Yeast, Baker’s

775 (from Dr. John Garvey), 843

Yeast, Cervical and Vaginal, unspecified

Also try “*Candida albicans*,” “*Epidermophyton floccinum* / Athlete’s Foot / Jock Itch,” and other entries in this section.

72, 422, 582, 706, 771, 787, 788, 1016, 2222

Yeast, Other (unspecified)

254, 72, 422, 582, 1016, 1130 to 1134, 1153 to 1155, 2222

Zearalenone

Causes excess estrogen in humans and animals.

100K

End of *Candida*, *Fungi*, *Molds* and *Yeasts* section.

CANINE PARVO VIRUSES, ALL TYPES

See “Parvo Virus” entries under **VIRUSES**.

CANKER SORES

See under **DENTAL**, *Mouth and Gums*.

CAPILLARIES, CONGESTION AND TO STIMULATE HEALING OF

See “Capillaries, to Stimulate Healing of” under **HEART, BLOOD AND CIRCULATION**.

CARBUNCLE

Inflammation of skin accompanied by pus (dead white blood cells in tissue liquefied by microbes). See **BACTERIA**, “*Staphylococcus pyogenes aureus*” and **SKIN**, “Boil.” Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*,” because people with *Candida* often have boils and carbuncles.

CARCINOMA

See under **CANCER**.

CARDIAC EDEMA

See “Congestive Heart Failure / Cardiac Edema” under **HEART, BLOOD AND CIRCULATION**.

CARPAL TUNNEL SYNDROME

See under **INJURIES** or **MUSCLES**.

CARTILAGE PRESERVATION AND HEALING

Dr. Richard Loyd determined the following pathogens that eat or damage cartilage. Under **BACTERIA**, see: “*Actinomyces israelii* / Actinomycosis,” “*Borrelia*, all types / Borreliosis / Lyme Disease,” all *E. coli* forms, “*Pseudomonas aeruginosa*,” the *Salmonella* entries, “*Staphylococcus* / Staph,” “*Staphylococcus pyogenes aureus*,” “*Streptococcus* / Strep,” the *Streptococcus pyogenes* entries, and “*Treponema pallidum* / Syphilis.” Under **CANDIDA, FUNGI, MOLDS AND YEASTS**, see “*Candida albicans*,” “*Aspergillus flavus*” and “*Funneliformis mosseae*.” Cancerous breast, thyroid and lung tissues also contribute to the degeneration of cartilage, so if applicable, see the appropriate entries under **CANCER**. See the major heading, **TUBERCULOSIS, ALL TYPES**, as some tuberculosis bacteria may also be involved.

Dr. Gary Wade reports great success with 1028 Hz, delivered as a square wave with a pad unit at an output voltage of between 3.6 and 6.3 volts. Put an electrode patch on either side of the injury. (DC offset must be *off*.) In addition to the frequencies below, try others under **REGENERATION AND HEALING**.

1028 (from Dr. Gary Wade—see above paragraph for instructions), 2720, 40K

CAT VIRUS, UNSPECIFIED

See under **VIRUSES**. Also see “*Toxoplasma gondii* / Toxoplasmosis” under **PARASITES, PROTOZOA AND WORMS**.

CATARACTS, ALL TYPES

See under **EYES**.

CATARRH

See under **RESPIRATORY TRACT**, *Lungs*; **GASTROINTESTINAL TRACT**; **EYES**; or **WOMEN**, *Uterus, Cervix, Ovaries and Fallopian Tubes*.

CELLULITE ELIMINATION

See under **OBESITY / OVERWEIGHT**.

CELLULITIS

Caused by inflammation and swelling of fluids that don’t drain, but become trapped in the tissues. The inflammation usually leads to deep infection below the skin. The infection can develop after the skin has been broken—generally from a cut, burn, surgical wound, injury, or animal or insect bite. Cellulitis can also result from skin lesions, ulcers, fungal skin infections, lymphedema, immune weakness, diabetes, and result from circulation problems and from being overweight. Symptoms include tenderness, pain, swelling, redness at the site of the infection, and sometimes fever and chills.

Cellulitis can occur anywhere, though adults often have it on the legs, face, and arms. Don’t confuse this condition with the dimpled fat stored in connective tissue beneath the skin surface (cellulite). Cellulitis is usually caused by bacteria, so see “*Staphylococcus*,” “*Streptococcus*” and “*Enterococcus faecalis*” under **BACTERIA**.

CEREBRAL PALSY

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

CEREBROSPINAL CONDITIONS

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

CERUMEN

See “Wax, Excessive / Cerumen” under **EARS**.

CERVICAL INFLAMMATION, CERVICAL ADENOMA, AND CERVICAL POLYP

See these respective entries under **WOMEN**, *Uterus, Cervix, Ovaries and Fallopian Tubes*.

CHANCRE

See “Syphilis” under **MEN**, *Penis* or **WOMEN**, *Vagina, Labia and Clitoris*.

Always use 40K with each session.
It doesn’t kill or disable pathogens,
but it does bring vitality to the cells.
Run it for as long as you want.

Niacin-Sauna Protocol to Eliminate Toxins

Chelation is the use of specialized ingredients to draw out and bind heavy metals (and occasionally other harmful substances), which the body then excretes. Usually performed over many months or even years, chelation is administered intravenously, by a licensed health practitioner; orally, by the subject (with or without doctor supervision); and occasionally via rectal suppositories (with or without doctor supervision). All natural health practitioners agree that toxins cause severe physical, mental and emotional damage. The problem is, opinions vary regarding the best way to eliminate these noxious substances (see pages 624–626).

The Niacin-Sauna Protocol also eliminates toxins. Because a sauna is used, there's no need to figure out which ingredients to ingest to mobilize and bind the toxins. Each day, the person takes Vitamin B3—niacin, *not* time-release niacin or its derivative niacinamide—starting with 100 mg, increasing the amount by 100 mg every few days. (Building up to 10 mg per kg of body weight is the goal.) Three hours after being ingested, the niacin starts releasing all lipophilic (fat-loving) toxins—metals, pesticides, solvents and other chemicals, even drug residues—from the fat cells. At the 3-hour mark, the subject sweats out the toxins by first exercising (optional, but recommended) and then getting into the sauna for at least one hour. (L. Ron Hubbard, who in 1979 developed a crude form of this protocol, hypothesized that the unpleasant flushing of the skin caused by niacin relates to the amounts of toxins in the body—and that as contaminants leave, the severity and duration of the flush decreases.) The protocol advises one to eat certain oils and/or activated charcoal to prevent the reabsorption of pollutants in the digestive tract. Minerals are taken to replace those lost via sweating, and to support the body in removing debris that the niacin has mobilized. Subjects also take vitamins, amino acids, and EFAs to ensure that the body is properly nourished.

Any toxin elimination protocol benefits from gut binders. Activated charcoal and bentonite clay bind to toxins in the digestive tract, and might be used instead of the oils, which sometimes upset the system.

The Niacin-Sauna program, proven to work, is described in Hubbard's book *Clear Body Clear Mind* (the version copyrighted 2002 and earlier contains information that later editions omit). However, the program has since been updated to ensure faster, easier, and more complete detox. See Appendix A, **Sauna-Niacin Therapy Protocol**, for information on personalized coaching and supervision, and where to go, for this daily protocol. People have reported results within two weeks.

CHEMICAL SENSITIVITY / POISONING

Also called “Multiple Chemical Sensitivity” (MCS) and “Environmental Illness” (EI). These labels tend to imply a deficiency or dysfunction in the person rather than a bona fide response to being assaulted by an amazing array of common synthesized poisons. Discredited for years by doctors as a paranoid form of mental illness, in 1995 this condition was recognized as physically-based by sixty government agencies. Over 80% of chemically sensitive people are women—perhaps because most toxins lodge in fat tissue, and women's bodies naturally contain more fat than men's bodies.

Symptoms include respiratory and digestive disorders, headaches, fatigue, body aches and pains, inflammation and swelling, susceptibility to chronic infections, and emotional and cognitive disorientation. Liver and nerve damage, and sometimes brain damage, are inevitable. There's no limit to the variety of symptoms because people respond individually to being poisoned. Every system of the body can be involved, whether from acute or chronic exposure. Toxic contaminants include detergents, plastics, solvents, heavy metals, cigarette smoke, gas fumes, pesticides, herbicides, makeup, perfumes, dyes, foods, drugs, and biological agents (such as mold). Once the individual becomes sensitized to a particular agent, subsequent reactions are provoked by infinitesimally small amounts of a wide range of substances. This is because an overwhelmed body (with an overworked, undernourished liver) can no longer break down contaminants into neutral substances and excrete them—and once this happens, everything is potentially toxic, even beneficial nutrients.

Rife researchers do not provide frequencies specifically for MCS/EI, as many systems in the body are compromised and there are usually multiple causes. Consult an experienced holistic practitioner. Symptoms are complex and interrelated, so try to isolate and tackle one or two problems at a time to lessen the onslaught of toxic waste and hence symptoms.

You will need plenty of rest and nutritional support, including trace minerals. Dr. Richard Loyd writes that free amino acids are vital for detoxification and healing disease (see Sidebar, “Underappreciated Amino Acids,” page 656).

If you have silver-mercury fillings, have them removed by a holistic dentist. The mercury is offgassing into vapors that you're constantly absorbing. Some heavy metals, similar to the actual valuable minerals that we need, occupy the same receptor sites. Chemical toxins and heavy metals (especially mercury) damage the mitochondria, which are the energy-burning units of the cells. This damage makes the cells unable to process thyroid hormone, thus causing hypothyroid-like conditions. The direct removal of mercury and other metals requires effort, time, and patience. These metals can be removed only if you follow both detoxification and cleansing protocols. Practitioners have widely varying opinions on the best ways to detoxify from mercury; see Sidebar, “Niacin-Sauna Protocol to Eliminate Toxins.” Also see Chapter 3, **Detoxification and Oxygen Therapies** for details.

There are many relevant categories. See “*Candida albicans*” and “*Sporotrichum pruinosum*” under **CANDIDA, FUNGI, MOLDS AND YEASTS**, as *Candida* feeds on heavy

metals. Try **PARASITES, PROTOZOA AND WORMS**. Check other listings for affected organs and glands, particularly the liver: **LIVER AND GALLBLADDER**, *Liver*. See “Thyroid, Underactive / Hypothyroidism” under **GLANDS**, *Thyroid*. See **URINARY TRACT**, *Kidneys*; and **RESPIRATORY TRACT**, *Throat and Lymph Nodes*. Also see **BACTERIA**, “*Mycoplasma*, many types,” because chemical sensitivity is often associated with *Mycoplasma* infection. Also see **REGENERATION AND HEALING**. 40K (run for as long as you want)

Acetaldehyde Detox

Acetaldehyde is a product of *Candida*. See “*Candida albicans*” under **CANDIDA, FUNGI, MOLDS AND YEASTS**. 3103032.511

Mercury, Aluminum, and Other Contaminants

“Heavy metals” refers to a group of toxic elements—aluminum, arsenic, mercury, cadmium, lead—that should never be ingested, inhaled or absorbed through the skin. They are deliberately added to thousands of products: adhesives, carpet, dental fillings, fabric softener, batteries, compact fluorescent light bulbs, personal care items, and drugs (including vaccines). Heavy metals can cause illness or exacerbate an already existing condition, including Alzheimer’s, autism, and chemical sensitivity. Mercury and aluminum, in any form, are among the most dangerous substances on the planet. They corrode the delicate hair-like tendrils on the nerve cells and strip off the protective fatty myelin coating on the nerve sheaths.

Fluoride, which is purposely added to dental products and water worldwide, can collect in the pineal gland and suppress higher brain function as well as melatonin and serotonin production. Fluoride belongs to a class of chemicals called halogens (which include chlorine and bromine) that displace iodine on the cell receptor sites. According to Mark Sircus, David Brownstein and others, saturating the body with iodine pulls all halides out of the tissues, to be excreted in the urine.

Candida feeds on mercury. See **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*”; you may have an infection.

Vaccinations, Reactions to

Negative reactions to vaccines are understandably normal responses to the receipt of poisons (see Chapter 1, **The Vaccine Controversy**). Reactions may include asthma, arthritis, autism, autoimmune conditions, convulsions, cancer, coughs, cramps, digestive disorders, fever, food and environmental allergies, flu-like infections, kidney malfunction, liver and skin problems, mood changes (including violent outbursts), neurological disorders (epilepsy, disorientation, memory loss), and sleep disorders. Inoculated infants and children often regress to behavior of an earlier age. They may react abnormally to sound and other stimuli. Also, they may suddenly have problems walking.

Milky Oats for Nerve Repair

Mercury has an affinity for nerve and brain tissue and is very destructive to them. If your nervous system is too damaged to recognize that mercury is present, your body may be unable to eliminate the metal even if you use a chelation protocol. Whole unhusked oat tops (not the stems or straw) contain high concentrations of compounds that heal nerve tissues. (Don’t confuse the oat *top* with oatmeal, the starchy groat *inside* the inedible, fibrous husk that’s separated from the husk, heated, steamed, and usually flattened into flakes we eat for breakfast.)

Before you begin your mercury detox program, drink two or three cups of oat top tea to regenerate your nervous system. Boil the water, turn off the heat, and steep a heaping teaspoon of oat tops for every cup. The tea is finished when the water turns light green. Its taste is surprisingly reminiscent of cow’s milk, which is why oat top tea is often called “milky oats.” It can be refrigerated for two days, but is more potent and better-tasting when brewed fresh.

A multifaceted approach is required to repair damage from inoculation (although of course a better option is to not vaccinate at all). The physical and mental afflictions that inoculated humans and animals suffer are due to many ingredients that comprise vaccines and can remain in the body unless eliminated: pathogens and pieces of them, biological waste, heavy metals, and food ingredients that are now allergens because they have been injected.

The metals—aluminum and its compounds, and the mercury-based thimerosal—need to be eliminated and microbial infections must be addressed. Organs of detoxification and elimination (including the liver and kidneys) also need support. See Sidebar, “Niacin-Sauna Protocol to Eliminate Toxins.”

Nutrients must be replenished and absorbed. Developmental pediatrician and autism specialist Mary Megson discovered that vaccines block the Vitamin A pathways in the brain and impair the memory T cells. She advocates a diet of Vitamin A-rich liver and kidney meats and especially cod liver oil. For amounts, she recommends ½ teaspoon of cod liver oil or 2500 IU of Vitamin A per day (for 2–5 year olds); ¾ teaspoon of cod liver oil or 3750 IU of Vitamin A per day (for 5–10 year olds); and 1 teaspoon of cod liver oil or 5000 IU of Vitamin A per day (for 10–12 year olds). Infants younger than 2 years old receive less than one-fifth of a teaspoon, once a day, either in their bottle or rubbed on the belly (the oil is easily absorbed through the skin). Dr. Megson reports that children have responded well, enjoying improved eye contact, decreased asthma symptoms, better language comprehension and verbal skills, and better overall health. Infants respond even better than older children.

A constitutional homeopath can prescribe a remedy specific to your symptoms, to help counteract the effects of vaccinations in both humans and animals. Thuja is often used for vaccinosis, but there are other remedies as well.

Try frequencies for any symptom pictures that develop, along with the specific pathogens in the vaccine. Also see **REGENERATION AND HEALING**. I have observed that rifting is quite healing for inoculated animals.

40K (run for as long as you want)

CHEMTRAILS

People from all over the world report seeing white streaks in the sky created by (usually unmarked) aircraft. The streaks somewhat resemble the ordinary white vapor trails emitted by a jet (known as *contrails*). However, *chemtrails* are thicker and remain in the sky for many hours. They begin as streaks and lines—often in “X” shapes or discernible grids—and spread out in feather-like patterns from a midline seam. Although most chemtrails are white, people sometimes report witnessing brown chemical trails as well as pale, web-like wisps that fall to the ground.

Wherever chemtrails are seen, there is a marked increase of flu-like infections that manifest as severe respiratory infections and coughing, gastrointestinal distress, hormonal impairment, liver and kidney damage, and neurological disorders including brain fog, memory loss, and headaches. In some cases, near-blindness and deaths have been reported.

Independent laboratories, analyzing the wisps and particulate matter that have fallen to the ground, report the following heavy metals: aluminum oxide particles, nano aluminum-coated fiberglass, arsenic, barium compounds, cadmium, lead, mercury, nickel, strontium, and titanium. Other ingredients include polymer fibers, sulfur dioxide, and ethylene dibromide or EDP (whose use as a pesticide was legally prohibited because it’s carcinogenic). Biological agents include strains of *Pseudomonas*, *Mycoplasma* and *Enterobacteriaceae* (a large category of bacteria), mold spores, and mycotoxins. Some recognizable biological agents include desiccated human red blood cells and certain portions of human white blood cells that are used in research labs to snip and combine DNA.

Various governments and universities (including the University of Oxford and Carnegie Institution’s Department of Global Ecology) publicly admit to the existence of these “geoengineering experiments,” which are supposedly being done to cool the Earth and protect its fragile ecosystems. Another advocate of these experiments is the US Department of Energy’s Savannah River National Laboratory in Aiken, South Carolina, which in 2008 began shooting porous-walled glass microspheres (which can be filled with gases and other substances) into the stratosphere. Even Wikipedia has a page on “Stratospheric aerosol injection (climate engineering),” in which it discusses sulfate aerosols “to limit the effect and impact of climate change due to rising levels of greenhouse gases.” These aerosols would be delivered by “sulfuric acid, hydrogen sulfide . . . or sulfur dioxide.”²² And on June 29,

2016, John O. Brennan, director of the Central Intelligence Agency (CIA), spoke at the Council on Foreign Relations in Washington, DC about many topics, including chemtrails. He discussed “the array of technologies—often referred to collectively as geoengineering—that potentially could help reverse the warming effects of global climate change. One that has gained my personal attention is stratospheric aerosol injection, or SAI, a method of seeding the stratosphere with particles that can help reflect the sun’s heat.”²³

In view of all the physical evidence (and data collected on these physical materials), it makes sense that some type of official statements would have to exist. However, the contamination of our atmosphere for the stated purpose of “weather modification” is clearly a ruse. Even though aluminum particles do reflect the sun’s rays and prevent some of its heat from reaching Earth, it makes no sense to dispense such a toxic metal—not to mention all of the other metals and biological agents—into the atmosphere.

As far back as 2003, *The Annals of Otolaryngology, Rhinology, and Laryngology* published a paper titled “Feasibility of aerosol vaccination in humans.” The abstract stated: “Several thousand human subjects have been aerosol-vaccinated over a period of many years in Russia with live-attenuated strains against many diseases. Extensive field trials in South America with aerosolized live-attenuated measles vaccine have also been successful, and excellent results have been reported with pilot projects employing inactivated or live-attenuated aerosol influenza A vaccine. . . . this method has already been used successfully in large populations.”²⁴ Some reporters have discussed finding lithium carbonate (the drug) in some chemtrail sprays. We already know that oxytocin, the “bonding” or “love” hormone produced by the human body, has been put into nasal sprays in the hope that it will help people who are “anti-social.” What is to prevent this and other medications from being sprayed on people as well?

In 2015, the US government unlawfully ordered employees of the National Weather Service and the National Oceanic and Atmospheric Administration to refrain from speaking about many aspects of their jobs—including the existence of chemtrails, beyond the purported purpose of weather control. Any reasonable person must ask why.

The frequencies to use depends on what you’ve been exposed to. See **BACTERIA**, “*Mycoplasma*, many types” and “*Brucella*, all types”; **TUBERCULOSIS**; and “Ebola virus / Ebola hemorrhagic fever” under **VIRUSES**, as Ebola has been found in Chemtrails as well. Also see specific listings pertaining to your symptom picture. Use a nebulizer (see page 798 and Chapter 3, page 469).

CYSTIC FIBROSIS (CF)

Abnormal proteins are created that prevent the easy transport of chloride (a component of salt), causing excess thick, sticky mucus to accumulate in the lining of the lungs and pancreas. The clogging causes breathing problems, coughing, wheezing, and frequent lung infections including pneumonia. If lung damage is severe, premature death is possible. Digestive fluids made by the pancreas may also become too thick to reach the small intestine, resulting in digestive problems. Research from the 1980s showed that CF

often developed in people who were deficient in selenium, and that they healed when given this mineral.

Many CF infections are caused by the bacterium *Pseudomonas aeruginosa* (below), which rarely causes problems in healthy people. Also try applicable entries under **PARASITES, PROTOZOA AND WORMS**.

DENTAL

Dental health is connected to the health of the rest of the body. Meridians corresponding to every organ and system are in the hands, soles of the feet, ears, colon, and teeth. Because the mouth is loaded with bacteria, dental infection can cause a wide range of problems—chronic fatigue, heart disease, allergies, even cancer—thus preventing recovery from any illness. Many people with “terminal” or unsolvable illnesses have completely recovered (some in 48 hours) after a tooth was pulled and the necrotic tissue in the area was removed. Sometimes the meridian of an adjacent tooth is affected as well, due to the seepage of bacteria; so the entire jaw should be thoroughly checked.

Some people get root canal surgery. The living pulpy structures of the tooth are removed and the inert tooth is allowed to remain in the jaw. Most dentists don’t remove the capillaries that harbor bacteria, which is why root canal teeth become reinfected, explains George Meinig in *Root Canal Cover-Up*. Many holistic dentists agree that teeth should not be left in the mouth because regardless of how they are extracted they will leave infections. However, Dr. Mark Manhart believes that if the area is thoroughly cleaned and a 2mm space is left surrounding the root, the area may fill in on its own and the tooth can safely remain. A cold spray like Endo-ice should be used to test the tooth. If the tooth is near-normal or normal, the subject will feel it the cold for several seconds. If the cold lingers and throbs, the tooth is live but infected, and will die. No sensitivity means the tooth is dead.

Similar chronic low-grade infections develop when teeth are extracted for whatever reason (“wisdom” teeth are commonly removed), and a portion of the periodontal ligament remains in the jaw. This prevents the body from filling in the tooth socket with healthy new bone and creates an environment for bacteria. Infection can also result if adjacent bone is not scraped and cleaned. This condition is called a cavitation, or cavity within the bone. The most effective treatment for cavitation is the mechanical removal of all infected areas (surgery). Cavitations are insidious. Initially, most people are asymptomatic. Or they might suffer from an assortment of low-level, chronic symptoms for years without being able to identify the cause. It can take decades for the origin of symptoms to become apparent. By then, serious damage to the body has usually occurred. If you must have teeth extracted, consult a dentist who’s knowledgeable about cavitations and knows how to properly clean the areas.

Although dental problems can be controlled with frequencies, a good diet and proper cleaning, infection will recur unless silver amalgam fillings are replaced with uranium-free porcelain or resins. Mercury, a toxic metal, comprises over half the content of so-called silver fillings.

Common Dental Pathogens

See dnafrequencies.com for frequencies not listed here.

- ◆ *Actinomyces israelii*
- ◆ *Aggregatibacter actinomycetemcomitans*
- ◆ *E. coli*
- ◆ *Eikenella corrodens*
- ◆ *Enterococcus faecalis* (in most root canal teeth)
- ◆ *Porphyromonas gingivalis* (main gingivitis bacterium)
- ◆ *Proteus mirabilis*
- ◆ *Proteus vulgaris*
- ◆ *Staphylococcus aureus*
- ◆ *Staphylococcus mutans*
- ◆ *Streptococcus pyogenes* (Streptococcus group A)
- ◆ *Treponema denticola* spirochete

As Hal Huggins extensively documents, mercury interferes with the oxygen-carrying capability of red blood cells. It also causes allergies and autoimmune disorders, upsets protein metabolism and the balance of gut flora, and decreases immune cell production so that immunity is weakened. Minute amounts of mercury destroy nerve tissue: brain cells die in ten minutes. When mercury destroys the delicate nerve cells and strips the protective fatty myelin sheath from the nerve stem, messages cannot be conveyed throughout the body (which fails to recognize that mercury is present). Mercury can cause depression, nervousness, insomnia, impaired kidney function, tremor, convulsions, infertility, and birth defects. The biochemical destruction in the brain from mercury is identical to that of Alzheimer’s.

The American Dental Association explicitly warns dentists not to touch mercury and to wear masks to avoid breathing its fumes. Yet mercury is put into people’s mouths! See a holistic dentist to get your silver-mercury fillings removed and replaced with less toxic porcelain or other material. Proper removal of mercury includes using rubber sheeting to prevent metallic vapors from being reabsorbed into the porous mucous membrane of the mouth; breathing oxygen during the procedure; and sometimes chelation during and after to ensure that any remaining mercury is escorted out of the body. Otherwise, mercury dust on the inside of the cheek can be absorbed. In lieu of filling removal, Dr. Richard Loyd advises to “temporarily seal the fillings. Hold the negative face of a flat magnet on the cheek near the tooth. Shine a white LED light on the filling for ten seconds. This effect lasts until the teeth are cleaned,”²⁵ after which the LED procedure is repeated.

Sauna therapy helps the body excrete heavy metals, including mercury (see Chapter 3, **Sauna Therapy**). Some substances chelate (bind to) metals and escort them out of the system. Before chelating mercury, to help restore the nerve cells and help them recognize the presence of the metal, drink oat top tea (See Sidebar, “Milky Oats for Nerve Repair,” page 697).

Fluoride is another poison that dentists legitimize. The sodium fluoride in toothpastes, which is actually a waste product from the aluminum and fertilizer industries, was once used as a rat poison. Hundreds of suppressed studies show that fluoride does not prevent cavities, but can actually cause tooth enamel to erode. Fluoride also hinders brain development and suppresses some higher brain functions, making people apathetic (see Chapter 3, **Water**). In fact, in a 2014 study showing how curcumin—a compound in powdered turmeric root (used in Indian cooking)—reverses oxidative stress in nerve and brain tissue, the brains of mice were first deliberately contaminated with fluoride to induce damage so the scientists could observe the effects of the curcumin! The article is even called “Curcumin attenuates neurotoxicity induced by fluoride: An in vivo evidence.”²⁶ Scientists have known for almost a century that fluoride causes brain damage. In the article, the researchers even stated *where* in the brain the damage occurs (the hippocampus, among other regions).

One inexpensive, easy, and surprisingly effective way to restore the teeth and gums is oil pulling (or oil swishing). Oil pulling, described in old Ayurvedic texts, has been publicized by F. Karach, a contemporary Ukrainian medical doctor, for its ability to cure many systemic diseases including allergies, digestive disturbances, headaches, respiratory disorders, blood sugar problems, skin conditions, and even cancer. I can't vouch for any of the systemic conditions, but personal experience shows that oil pulling really does help eliminate plaque (and pain) in the mouth. The original protocol called for one tablespoon of unrefined sesame oil, although some people prefer coconut oil. (Coconut oil contains about 50% lauric acid by weight and thus inhibits various bacteria, especially *Streptococcus mutans*—an acid-producing bacterium found in the mouth and responsible for tooth decay—as well as the fungus *Candida albicans*.) The oil is poured into the mouth but not swallowed. Enough room must be left in the mouth for additional saliva that the salivary glands will secrete in response to the presence of oil. The oil is swished in the mouth, at least one hour away from eating or drinking, one to three times a day for 15–20 minutes—enough time to bind the toxins without allowing them to be reabsorbed in the mouth. The oil mixed with saliva becomes thin and white. Don't swallow the oil, which is now filled with toxic debris. The swirling is believed to activate enzymes in the mouth, which pull toxins from the blood. Dr. Karach is reported to have stated that it can take from two days to one year to completely cure a condition. When swishing for dental problems, people report both eliminating plaque and remineralizing teeth. Oil pulling also helps alleviate (if not eliminate entirely) receding gums and dental pain. When you're finished, spit out the oil into the trash and not the sink or toilet, as the oil can clog plumbing pipes.

If the mouth is kept alkaline for several hours at a time (without food or beverages), the teeth may remineralize. Dr. Manhart has formulated a solution of free calcium, zinc, and other minerals that help correct the pH of the mouth.

Poisonous nickel alloy braces should be replaced, at the very least, with stainless steel. However, be aware that any metal in the mouth conducts electricity, and thus interferes with natural nerve conduction. It's far better if you have the option of using dentures made of safe plastic. Also, both titanium and zirconium are unsafe; neither should be used for implants.

Despite cautioning others about using electrodes on the face, I admit that some rifiers (including myself) have successfully used electrode patches on the cheeks for gum and tooth infections. The standard medical disclaimer is to avoid applying current to the face because the current might irritate or damage the delicate facial skin if it's too strong. Also, passing electrical current through the carotid artery (located on either side of the neck, under the jaw, just in front of the bottom of the ear) can cause permanent heart damage and even death. In fact, laboratory researchers routinely send electrical current through the carotid artery of experimental animals to create blood clots when their goal is to induce heart attacks. Therefore, electrodes must be used very carefully with three stipulations. One, the power control must be at a very low setting. I bring the signal to a high enough level so the current can barely be felt. If pain is felt or if muscles twitch, the signal is too strong. Two, salt water is held inside the closed mouth. The highly conductive salt water ensures that the current penetrates the tissues. (The body is constantly producing saliva, so the mouth is filled with salt water only about two-thirds of its total capacity. After an hour session, there won't be any room left in the mouth. The saliva, which is now filled with infectious debris, shouldn't be swallowed.) Three, with this delivery system, it appears to be the electrical current, rather than specific frequencies, that disables pathogens. Some European practitioners suggest using any frequency below 1000 Hz. Six consecutive days of 1-hour sessions is sufficient for many dental problems, but you may need more days if necessary.

One more thing. Brushing or gently scraping the tongue will eliminate the thin layer of debris and coating, along with the bacteria that reside there. It will also freshen the breath.

Mouth and Gums

When the gums separate from the teeth to form pockets (even if the gap is slight), food particles become trapped inside. However, gums that recede can grow again, given the proper nutrients and mouth terrain. For gum repair and regrowth, one solution is a product called Peri-Gum®. It contains extracts of echinacea, bloodroot, white oak bark, bayberry and cayenne, and tea tree and peppermint essential oils. You can also make your own dental care products: see Sidebar, “Simple Mouthwash and Toothpaste Recipes.” Food grade hydrogen peroxide works as a mouthwash because it raises the oxygenation of the tissues, thus helping to prevent infection (see Chapter 3, **Oxygen Therapies**). The germicidal properties of many essential oils are well known. They halt bleeding; kill bacteria, fungi and viruses; and reduce inflammation.

Abscess

Cavity formed by the disintegration of tissue, which creates pus, an accumulation of dead white blood cells. Use frequencies for known pathogens in addition to the ones below.

190, 428, 444 + 1865, 450, 465, 500, 660 + 690 + 727, 760, 787, 802 + 1550, 880, 2170, 2720

Bad Breath

See “Halitosis / Bad Breath” in this section.

Cancrum oris

Rapidly growing oral or nasal ulcer, which can become gangrenous.

20, 660 + 690 + 727, 787, 802 + 1550, 880

Canker Sores / Stomatitis Aphthous

Ulcers on mucous membranes of mouth. Correct any digestive disturbances. Also see **VIRUSES**, **Herpes, all types** and applicable entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

First try: 904.67 (for 10 minutes, sweep 3 Hz on either side of main signal), 901, 902, 903, 904, 905, 906 and 907 at 5 minutes a piece.

Then try: 234, 278, 465, 478, 487, 498, 568, 672, 677, 702, 787, 788, 955, 982

Catarrh, or Mucous Membrane Inflammation

In various places including the respiratory tract, gastrointestinal tract, eyes, and uterine area.

20, 380, 444 + 1865, 660 + 690 + 727, 787, 800, 802 + 1550, 880

Dematium nigrum

Soil fungi found in human lesions.

243, 738

Eikenella corrodens

Causes dental infections, often found with *Strep*. Also lives in intestinal, genital, and respiratory tracts.

From Dr. Richard Loyd: 834

Entamoeba gingivalis

Highly infective ameba causes gum infection.

From Dr. Richard Loyd: 477

Fistula Dentalis

Abnormal tubelike passage in the jaw.

550, 660 + 690 + 727, 844, 878, 1122

Gingivitis / Gum Inflammation and Infection

Caused by a buildup of plaque or tartar on the teeth, or injury to gums due to brushing that's too rigorous. This condition is called pyorrhea if there is

Simple Mouthwash and Toothpaste Recipes

Most commercial products for the teeth and mouth are made with toxic ingredients, including artificial flavors, preservatives, carcinogenic dyes, and fluoride (which is a poison). Glycerin, put into even “healthy” brands of toothpaste, causes bacterial plaque to stick to the teeth. Below are simple ingredients you can use to make your own effective mouthwash and toothpaste. All of the essential oils (EOs) and extracts in the mouthwash fight pathogens. The toothpaste can be wet (from the coconut and essential oils added to baking soda), or dry (if you use the powders only). Experiment to find what works for you. All essential oils should be food grade. Recipes are approximate. Effective and safe commercial products are also suggested if you don't want to make your own.

Mouthwash

#1: Hydrogen peroxide, 3% concentrate, food grade. (Don't leave in mouth for long; it can damage teeth.)

#2: Base of 8 ounces of alkaline water (with a pH of above 7.0, as the mouth is naturally alkaline). Add:

- ◆ 3 ounces aloe vera juice
- ◆ 10 drops cinnamon EO
- ◆ 10 drops clove EO
- ◆ 10 drops peppermint or spearmint EO
- ◆ 5 drops tea tree EO
- ◆ 1–2 drops grapefruit seed extract
- ◆ *Optional:* 5 drops *Sangre de grado* (Dragon's Blood)
- ◆ *Optional:* DMSO (20 parts other ingredients to 1 part DMSO, to drive fluid deeply into tissues and bone)
- ◆ *Optional:* 30 drops mastic gum tincture may work better than hydrogen peroxide

#3: Commercial: Tooth & Gums Tonic®, Peri-Gum®

Toothpaste

#1 (Dry):

- ◆ 3 teaspoons baking soda
- ◆ 2 teaspoons calcium powder (if not used, increase amount of baking soda)
- ◆ 3 teaspoons white oak bark powder
- ◆ 1 tablespoon of finely granulated xylitol
- ◆ 3 drops of tea tree or cinnamon EO, or both
- ◆ 3 drops of peppermint EO, to taste

#2 (Wet):

- ◆ 5 tablespoons coconut oil
- ◆ 3 teaspoons baking soda
- ◆ 3 teaspoons white oak bark powder
- ◆ 1 tablespoon of finely granulated xylitol
- ◆ 3 drops of tea tree or cinnamon EO, or both
- ◆ several drops of peppermint EO, to taste

#3: Commercial: Coral White®, Pearlie White®, Squigle®

pus (an accumulation of white blood cells). Infection usually consists of severe infection of the gums, often with pus and other discharge, causing the gums to shrink and the teeth to loosen. See “Simple Mouthwash and Toothpaste Recipes,” page 703.

From Dr. Richard Loyd: 354, 867, 477

20, 146, 522, 444 + 1865, 465, 660 + 690 + 727, 726, 776, 787, 802 + 1550, 880, 1556, 1600, 1800, 2008, 2720, 2489

Halitosis / Bad Breath

Check for an impacted colon, *Candida* infection, infected gums, insufficient friendly flora, or an ileocecal valve that’s stuck open or closed. Located where the small intestine meets the large intestine, the valve is designed to prevent waste material in the large intestine from backing up into the small intestine. Ask a chiropractor to show you how to adjust it so it will open and close properly. Drink chlorophyll to kill germs and odor. Brush your tongue. See other listings for infection in this section.

Herpes Sores in Mouth

Contrary to popular belief, the different types of *Herpes* are interchangeable. Sores can also appear in genitals and on the skin along nerves, where it is known as *Herpes zoster* or shingles. If these frequencies are not effective enough, see **VIRUSES, Herpes, all types**.

428, 465, 660 + 690 + 727, 787, 802 + 1550, 880, 1500, 1800, 1850, 2489

Leukoplakia

White patches in mouth. This can precede malignancy!

465, 660 + 690 + 727, 2008, 2127.5

Oral Lesions

Open wounds or sores, usually infected. Although dental problems can be controlled or completely eliminated with treatment, infection will always recur (often with stress or poor diet) until all mercury inlays (known as “silver fillings”) are replaced with uranium-free porcelain or resins, and nickel alloy dental appliances are replaced with stainless steel. Mercury, nickel and uranium are toxic (poisonous) metals—and have toxic effects (as do aluminum and palladium). They impair the body’s immune function, causing one to be very susceptible to infections. Because the mouth is the gateway to the entire body, an infection in the gums or teeth can prevent the recovery from any illness. Also see “Toothache / Tooth Decay” under **DENTAL, Teeth**.

146, 333 + 523 + 768 + 786, 444 + 1865, 465, 522, 555, 660 + 690 + 727, 760, 776, 787, 802 + 1550, 880, 1600, 1800, 2008, 2489, 2720

Pemphigus

Rare autoimmune disorder. Symptoms include blisters in the outer layers of the skin and the mucous membranes of the nose, mouth, and throat. Also see **AUTOIMMUNE DISORDERS**, and entries for the affected body part.

893 (from Dr. John Garvey), 665, 694

Porphyromonas gingivalis

Highly infectious bacterium that causes gum inflammation and infection.

867

Pyorrhea

See “Gingivitis / Gum Inflammation and Infection” in this section.

Stomatitis Aphthous

See “Canker Sores / Stomatitis Aphthous” in this section.

Thrush

Ulcerous white patches in the mouth caused by the fungus *Candida albicans*. Often accompanied by fever and gastrointestinal disturbance. Also see entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

414, 464, 465, 660 + 690 + 727, 787, 880

Trench Mouth

Bacterial infection of tonsils and floor of the mouth. Symptoms include inflammation, ulceration, and painful swelling. Be very strict about not eating sugar; it will feed the condition. Also see listings under **RESPIRATORY TRACT, Nose and Sinuses**.

From Dr. Marty Monahan: 108, 143, 146, 160, 478

Also try: 20, 465, 600 + 625 + 650, 660 + 690 + 727, 726, 776, 787, 802 + 1550, 880, 1556

White Patches in Mouth

See “Leukoplakia” in this section.

Teeth

Teeth are living parts of the body. Beneath the outer layer of hard enamel (made of calcium and phosphate), and the dentin (the middle layer and the bulk of the tooth), is an inner core called the pulp (comprised of nerves and blood vessels). A bone-like material called cementum surrounds the root, connecting the teeth to the jaw. Unlike bone, teeth do not produce red blood cells, and are built to absorb much more shock than the skeletal system. The first set of twenty “baby” teeth begin appearing at 6 months of age. The second, permanent set form between the ages of 6 and 12, the new tooth forming beneath the old one and pushing it out of the jaw. Extra molars erupt in the adult jaw, sometimes requiring extraction if there isn’t enough room in the mouth.

The most common health problem with teeth is the formation of plaque—a soft white layer that contains bacteria, often *Staphylococcus mutans*. The bacteria produce biofilm, which enables them to adhere to the teeth. If the plaque is not removed after a few days, it hardens to become tartar. More serious problems arise when the bacteria produce lactic acid, which dissolves the enamel through demineralization. However, teeth have been known to renew themselves if the pH in the mouth is at least 5.5. Healthy saliva has an alkaline pH of 7.0 or higher. Some practitioners report that if there is an interval of several hours without any intake of food, the saliva can return the dissolved minerals to the enamel and remineralize the teeth. Cavities (“dental caries” in medical terminology) occur when over a period of time, there is more demineralization than remineralization. Pain in the teeth occurs when the acids in the mouth penetrate the dentin and reach the nerve-rich pulp. Because bacteria thrive on sugars in the mouth, a regular practice of teeth cleaning, rinsing, and flossing is the best preventive dental hygiene. Dentists usually recommend holding the toothbrush at a 45 degree angle to remove plaque from the space between the gum and tooth. Studies show that brushing for longer than two minutes, at a pressure heavier than the weight of an orange, does not remove additional plaque and in fact may damage the teeth and gums. Acidic foods such as tomatoes, citrus fruits and vinegar soften the enamel, which can then be damaged by immediate brushing. If you eat acidic foods, rinse the mouth first with either plain water or water and baking soda (which is alkaline and neutralizes the acids), and wait a half hour to brush.

A few commercial toothpastes do not contain fluoride, artificial flavors, preservatives, or sodium laurel sulfate. You can also make your own; see Insert, “Simple Mouthwash and Toothpaste Recipes,” on page 703.

Ozone, used consistently, will also remove biofilm. Administer the gas inside the mouth (but don’t inhale it), or swish with ozonated water or ozonated olive oil. See Chapter 3, **Oxygen Therapies** for more information.

Teeth Grinding / TMJ Problems / Jaw Pain

Also called “bruxism,” clenching the jaw and grinding the teeth (when one isn’t eating) has become a major problem. This often occurs at night, but not always; and it can afflict all ages. It’s unusual for children to grind their teeth; but if they do, it may be due to an obstruction in their breathing pathway and they should be checked by a doctor.

Chronic grinding of the teeth can lead to intense muscular pain in the head, neck and jaw, causing headaches and what has become known as “TMJ”—an acronym for “temporomandibular joint,” where the top of the jawbone meets the skull on either side. These joints are complex structures containing bone, muscle and tendon. Chronic teeth grinding,

besides causing intense pain, can cause tooth erosion, cracking and breaking; a shift in position of the teeth or loose teeth; increased tooth sensitivity; gum recession; and even changes in the facial bone structure.

Dentists are aware that causes of teeth grinding can be an inherently abnormal bite, trauma (such as whiplash from an auto accident), unusual repetitive motion—and of course stress, which includes worry, anger and fear. Sleep apnea (a pause in breathing during slumber) and other sleep disorders such as snoring can also play a huge role.

Conventional medicine offers a limited number of options. Sometimes a sleep study is conducted, during which a person is monitored at night with electrodes in a clinical setting to determine if the airways are blocked (which leads to sleep apnea). A dentist can make a mouth guard—pieces of plastic that fit into the mouth and prevent the teeth from touching (and hence, grinding), but this is palliative.

Holistic medicine offers face, neck, shoulders and back massage; meditation; and craniosacral release. Rescue Remedy from Bach Flower Essences or Calm and Clear from Australian Bush Flower Essences can help (see Chapter 3, **Homeopathy**). The following Bach Flower combination dissipates stress and balances many emotions, thus helping to relax the jaw muscles: Agrimony, Holly, Oak, and Vervain. You can add Cherry Plum and Willow as well if the first four don’t produce results in a week.

Teeth clenching and grinding can also be caused by some bacteria and parasites. The frequencies below are for the bacteria *Mycoplasma salivarium*, but also see **PARASITES, PROTOZOA AND WORMS**. Also see frequencies under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS; MUSCLES; PAIN;** and **INJURY**.

253, 279, 420, 453, 761, 832

Tooth Extraction, for afterward

7.83, 47, 95, 3K

Tooth Socket Infection

Enterococcus faecalis is commonly found in the gastrointestinal tract, and can cause life-threatening infections in humans. It often grows in areas that have had root canals.

From Dr. Richard Loyd: 756, 757, 758, 759, 760, 761 (you can sweep all of these), 834

Tooth Regeneration

In addition to the frequencies, supplement the diet daily with 800 IU of Vitamin E and 1,000 mg (1 gm) of Omega 3 fish oil. One rifer did this and used the frequencies below and saved a tooth.

First try, for 45 minutes: 2720

Then try, for 10 minutes each, every day: 7, 25, 424, 465, 660 + 690 + 727, 784, 787, 880, 1552, 1560, 1577, 10K, 40K (for as long as desired)

Toothache / Tooth Decay

Plaque, the sticky acidic film from many types of bacteria, forms on the teeth and lodges in pockets between the teeth and gums. The bacterial acids can destroy tooth enamel and cause cavities and gingivitis (gum disease). The first set of frequencies below is a compilation of *Staph*, *Strep* and other bacteria commonly found in the mouth. Many of the numbers were determined by Dr. Richard Loyd.

First try: 943 (from Dr. John Garvey), 253, 262, 279, 354, 358, 420, 453, 565, 761, 787, 832, 834, 842, 1980.47, 2154

The *Staph* and *Strep* pathogens keep mutating, so also try (most frequencies from Dr. Richard Loyd): 366, 456, 466, 467, 468, 478, 555, 576, 644, 647, 668, 687, 727, 728, 737, 738, 745, 757, 764, 767, 784, 785, 333 + 523 + 768 + 786, 786.5, 788, 824.4, 878, 936.97, 943, 944.4, 946, 999, 1050, 2352.44, 2371.11, 5906.25, 5953.12, 7270, 8697

Also try: 20, 23, 46.5, 47, 73, 95, 146, 160, 190, 222, 488, 465, 470.5, 488, 522, 555, 567, 600 + 625 + 650, 646, 660 + 690 + 727, 747, 766, 776, 800, 802 + 1550, 880, 1500, 1600, 1800, 1980.47, 2489, 2720, 3K, 5K, 5170, 2489, 2720, 7880

From Dr. James Bare: sweep 723–730

End of Dental section.

DISC AND SPINE PROBLEMS, ALL

See under **BONE AND SKELETON.**

DISTEMPER

Caused by an infectious virus from the *Morbillivirus* family (which also includes the virus that causes measles). Distemper is best known for affecting dogs, but it can also spread to cats, seals, and lions. Symptoms in dogs include fever; skin eruptions; malaise; eye discharge, inflammation or dryness; dehydration; uncontrollable muscular contractions; seizures; pitting in the enamel of the teeth; vomiting; diarrhea; coughing; and runny nose. Symptoms in cats include fever, severe depression, vomiting, and dehydration.

The canine distemper virus antigen has been found in the joints of dogs afflicted with rheumatoid arthritis. (An antigen is a protein, pathogen, pollen, or other substance foreign to the body that stimulates the body’s immune response so that it produces antibodies. Antibodies are substances that recognize and fight infections and foreign substances.) It is not known whether vaccines or “naturally occurring” infections are the cause.

From Dr. John Garvey: 242, 254, 312, 551, 573, 671, 712, 1269

Also try: 253, 255, 442, 624, 660 + 690 + 727, 760, 940, 950, 1950, 8567

DIVERTICULOSIS / DIVERTICULITIS

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine.**

DIZZINESS

DOWN’S SYNDROME

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

DROOPY EYELID

See “Eyelid, Droopy” under **EYES.**

Natural Remedies for the Ears

For ear infections, drop a 3% solution of food grade hydrogen peroxide into an ear until it stops fizzing. Lie on your side for each ear so the fluid doesn't spill out. Colloidal silver can also be used as often as needed. A tincture of the herb mullein is commonly used. So is garlic-infused olive oil. Also try ear insufflation using ozone (see Chapter 3, **Oxygen Therapies**).

DROPSY

See "Lymphedema / Edema / Dropsy / Water Retention" under **LYMPHATIC SYSTEM**.

DRUG ADDICTION

See "Addiction to Drugs" under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

DUODENAL ULCER

See "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" under **BACTERIA**.

DUODENITIS

See under **GASTROINTESTINAL TRACT, *Small Intestine***.

DUPUYTREN'S CONTRACTURE

See under **MUSCLES**.

DYSENTERY, AMOEBIC

See "Amoebic Dysentery / *Entamoeba histolytica*" under **GASTROINTESTINAL TRACT, *Systemic Conditions***; or "*Entamoeba histolytica* / Amoebic Dysentery" under **PARASITES, PROTOZOA AND WORMS**.

DYSLEXIA

There are no known frequencies for dyslexia, so see "Attention Deficit Disorder (ADD) / Attention Deficit Hyperactivity Disorder (ADHD)" under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**. Also see, in Appendix A, the Irlen Institute entry under **Color Therapy**.

DYSMENORRHEA

See "Menstruation, Painful / Dysmenorrhea" under **WOMEN, *Menstruation and Menopause***.

DYSPEPSIA

See "Indigestion / Dyspepsia" under **GASTROINTESTINAL TRACT, *Systemic Conditions***.

DYSTONIA, VEGETATIVE

See under **MUSCLES**.

DYSTONIA WITH OSTEITIS

See under **LIVER AND GALLBLADDER, *Gallbladder***.

—E—

EARS

The term "ear" can refer to just the outer ear, or all of its structures. The outer ear is the pinna, with its visible cartilage folds, plus the eardrum. The middle ear includes three tiny sound amplification bones (hammer, anvil and stirrup), some tendons, and nerves. The inner ear consists of the tiny coiled cochlea, and the vestibular apparatus designed for balance (also called the labyrinth, due to its fluid, maze-like passages). The vestibular and visual systems work together to keep objects in focus when the head is moving.

Acoustics is the science of frequencies, but sound waves are a mechanical phenomenon. First felt as air pressure, the mechanical sound waves gently push on the ear drum, making it vibrate. As the vibrations pass through the other portions of the ear, they are converted into electrical impulses, conveyed along nerves, and then translated into sound by the brain.

Ear infections not only can cause loss of balance, but they can be serious if pathogens reach the inner ear and the infection spreads to the brain. Although the conditions in this section are listed as discrete categories, if your symptoms are stubborn, try frequencies from all of the entries.

Ear Conditions, Several

Includes discharge, vertigo, tinnitus, and hearing loss.

9.19, 9.2, 20, 158, 201, 340, 410, 440, 535, 542, 645, 652, 660 + 690 + 727, 683, 787, 880, 10K, 40K

Infections, General

More children than adults suffer from ear infections. Symptoms include pressure, pain and inflammation in the middle ear, which is often caused by the buildup of fluid and can be seen as pus oozing out of the ear. Infections that are not treated can lead to vertigo, nausea and vomiting, tinnitus (ringing in ear), and even hearing loss. Causes of infection include allergies, colds, sinus infections, smoking, or even secondhand smoke exposure.

From Jimmie Holman. Deliver frequencies in the order written. Program was written for Pulsed Technologies units: 33152, 33344, 35008, 39827, 40640, 40960, 41344, 41363, 41600, 42624, 43520, 43840, 46528, 48K, 48640, 49152, 49600, 49664, 50368, 51200, 51328, 53248, 56320, 57600, 59520, 30720

Cerumen

See "Wax, Excessive / Cerumen" in this section.

Cholesteatoma

Benign inflammatory tumor usually found in the middle ear, near the mastoid bone behind the eardrum. May be caused by longstanding ear infections. Also see **CANCER** entries in case the tumor becomes malignant.

453, 618, 793 (all from Dr. John Garvey), 5058

Deafness from otosclerosis

Fusion of structures of inner ear, resulting in partial to complete immobility.

9.19, 9.2

Deafness, partial to complete

One might assume that nerve impairment is causing the condition, but the researcher who provided this listing does not specify.

9.19, 9.2, 20, 65, 660 + 690 + 727, 760, 787, 802 + 1550, 880, 10K

Discharge from Ears

9.19, 9.2, 20, 660 + 690 + 727, 787, 880

Eustachian Tube / Inner Ear Inflammation

465, 660 + 690 + 727, 776, 787, 802 + 1550, 880

Fungus in Ear

Don't rely just on the frequency below. Also see the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

854

Hearing, Loss of

See "Deafness" in this section.

Ménière's Disease

Auditory vertigo often accompanied by deafness and ringing in the ears. According to medical books, this is really a catch-all name for a wide variety of symptoms including various ear conditions and nausea whose underlying causes can include drug poisoning, circulatory disturbances, and microbial infections. Also see "Otitis" entries and "Tinnitus" in this section; **DENTAL; HEART, BLOOD AND CIRCULATION; and CHEMICAL SENSITIVITY / POISONING**, "Antiseptic Effect, to Produce."

8.8 to 9, 33, 329 (for at least 7 minutes), 333 + 523 + 768 + 786, 465, 428, 590, 660 + 690 + 727, 782 (for at least 26 minutes) 787, 802 + 1550, 880, 1130, 5K (for at least 16 minutes)

Mite, Follicle / *Demodex folliculorum*

Mites live in the hair follicles of humans. Although generally harmless, they can cause inflammation in the eyelashes, external ears, and facial skin.

From Dr. Richard Loyd: 476, 1332.03, 1690.5

From Jimmie Holman, for his company's equipment. Deliver frequencies in precisely the order written:

64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

From Dr. Hulda Clark: 682K or 1332.03 and 1690.51 (for units unable to reach the KHz range)

Mucor racemosus fresen

A fungus that grows on decaying vegetation and bread, can cause ear infections, and according to Guenther Enderlein, is implicated in most if not all coronary conditions.

First try: 310, 474, 875

Also try: 473, 686, 713, 729, 731, 751, 760, 778, 871, 873, 876, 878, 887, 1200, 7768, 7976, 8788

Otitis Externa

Inflammation of the outer ear. To rid the ear of excess water, hop on the leg that's on the same side as the clogged ear while tilting your head to the side so the ear opening is parallel to the ground. This will help the water to leave.

174, 464, 482, 660 + 690 + 727, 770 (from Dr. John Garvey), 784, 787, 880, 5311

Otitis Media

Middle ear swelling and/or infection, usually accompanied by fever. Also see **BACTERIA**, "*Streptococcus* / *Strep.*"

72, 125, 316 (from Dr. Garvey), 440 (for at least 5 minutes), 522, 720, 784, 786, 802 + 1550 (for at least 10 minutes), 880

Otosclerosis

Fusion and resulting partial immobility of inner ear structures, causing progressive deafness.

9.19, 9.2

Ringing in Ear

See "Tinnitus" in this section.

Staphylococcus auricularis

Often involved in ear infections.

From Dr. Richard Loyd: 366, 2976906

Swimmer's Ear

A bacterial or fungal infection of the ear canal that usually occurs from spending a lot of time in water. The pain is extreme and can last for weeks. Heat usually helps alleviate pain; but avoid applying heat if the infection is fungal because heat causes fungus to grow. If your ears become clogged with water, hop on the leg that's on the same side as the clogged ear while tilting your head to the side so the ear opening is parallel to the ground. This will help the water to leave.

See frequencies for "Otitis Externa" in this section. Also see "General Fungus / Molds / Yeasts" under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

Tinnitus

Ringing in the ears often caused by infections of the inner ear, middle ear and/or auditory nerve, characterized by subjective perceptions of buzzing, whistling, hissing, or roaring sounds in ears. This condition may be caused by heavy metal toxicity or prescription drugs, or exacerbated

by deficiencies in minerals, including magnesium. Also see “Otitis” entries and “Ménière’s Disease” in this section; and entries under **DENTAL**, under **HEART, BLOOD AND CIRCULATION**, and under **CHEMICAL SENSITIVITY / POISONING**. Some form of Herpes is often involved; so also see, under **VIRUSES**, *Herpes, all types*, “Herpes Virus 4 (Human Herpes Virus 4) / Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)” and “*Herpes Virus Type 5 (Human Herpes Type 5) / Cytomegalovirus (CMV) / Salivary Gland Virus*.” Also see “*Branhamella catarrhalis / Moraxella catarrhalis*” under **BACTERIA**, which can cause an inner ear infection.

Vertigo (Dizziness)

The inner ear is responsible for maintaining our sense of balance. Vertigo can be caused by an infection, head injury, neurological impairment, adrenal exhaustion, or low blood pressure. See the appropriate entry for your specific issue as well as “Brain Tumor” under **CANCER**, as dizziness is a noted symptom.

4, 5.8, 9.19, 9.2, 20, 60 + 100, 660 + 690 + 727, 787, 880

Wax, Excessive / Cerumen

Earwax (cerumen) is made by glands inside the ear canal to shield it from dust and dirt, to protect the ears from infection, and to help maintain the ear canal’s natural acid balance. Sometimes an excessive amount of earwax is produced, and unless the buildup is removed hearing can be affected. Don’t shove cotton swabs or other objects deep into the ear—you don’t want to puncture the ear drum (although a punctured ear drum can sometimes regenerate). To loosen wax, into the ear canal you can drop some warmed olive oil, mullein herbal tincture, or 3% food grade hydrogen peroxide.

311, 320 (from Dr. John Garvey), 750, 720, 984

End of Ears section.

EATING DISORDERS

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

EBOLA VIRUS

See under **VIRUSES**.

ECHO VIRUS

See under **VIRUSES**.

ECZEMA

EUGLENA

See under **PARASITES, PROTOZOA AND WORMS**.

EURYTREMA PANCREATICUM

See under **PARASITES, PROTOZOA AND WORMS**.

EUSTACHIAN TUBE INFLAMMATION

See “Eustachian Tube / Inner Ear Inflammation” under **EARS**.

EYES

The eye is a complex sphere of gel-like fluid with a transparent film (cornea) on its surface. In the front center rests the iris, a colored ring of muscle fibers that open and close like the aperture of a camera. The opening is the pupil. The lens of the eye is behind the iris, held by small muscles that tighten and relax to change the shape of the lens depending on whether an object is close or far. The retina, a light-sensitive, curved panel of cells at the rear of the eye,

Nutrients, Herbs, Antimicrobials for the Eyes

Colloidal Silver. Spray into eye often. Add half teaspoon of Willard’s Water to a 4-oz bottle for intensified benefits. Clears vision, soothes the eye, kills pathogens, neutralizes pollutants, helps cataracts and glaucoma.

Castor Oil. Reduces inflammation, kills pathogens, soothes. Safe to use directly in eye if it’s organic, and is free of hexane and other solvents and additives.

Supplements. The eyes are related to the liver, gallbladder, and gastrointestinal tract: we see the eyes turn yellow when the liver is jaundiced. Therefore, improving the digestive organs helps the eyes. Digestive aids include probiotics, hydrochloric acid, enzymes (amylase, protease, lipase and others), and ox bile or bile-stimulating herbs. Nutrients for the eyes include:

- ◆ Carotenoid supplements: astaxanthin, zeaxanthin, and lutein—yellow, orange, and red plant pigments.
- ◆ Foods high in carotenoids: salmon, krill, pastured egg yolks, carrots, squash.
- ◆ Alpha-Lipoic acid (ALA), a powerful antioxidant that helps recycle Vitamin C.
- ◆ L-Carnosine, amino acid anti-aging compound.

Christopher’s Herbal Eye Formula. Bayberry bark, eyebright, goldenseal root, red raspberry leaf, cayenne. Two to three drops in distilled water in an eye cup bring oxygen to tissues and fluids. May dissolve protein deposits, including floaters; improve near, distance and night vision; reduce swelling, burning and itching; eliminate cataracts; heal glaucoma; and reverse macular degeneration.

receives the light focused by the lens. Blinking is protective: it lubricates the eyes, and spreads antibacterial tear fluid on them. Although blinking is a reflex, it can also be controlled. When engrossed in a task, many people forget to blink.

Before light is converted into an image, it enters the cornea through the pupil in the iris, and is then projected through more fluid through the lens and onto the retina. There, the light is converted into electrical signals that are transmitted through the optic nerve and visual pathway, through the occipital cortex, to the brain. Vision processing centers for different parts of each eye exist in both sides of the brain.

Evidence from Paul Scanlan links nearsightedness with abnormal breathing patterns: the lack of pressure in the sinus cavities causes the rear of the eyeball to be misshapen. Many people have helped or completely healed their faulty vision using the Bates program of movement—breathing, taking in sun through closed eyelids, cupping the palms over closed eyelids—and some form of body-mind therapy to help deal with fear and other emotions. Exercise, adequate sleep and sunlight, and the ability to handle stress also play a huge role.

The muscles that change the shape of the lens of the eye for near and far seeing can become paralyzed and inflexible

with fright from unresolved emotional issues. The eyes are an extension of the brain, so also see the many entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS.**

General Range of Eye Ailments

20, 80, 160, 350, 360, 400, 496, 660 + 690 + 727, 787, 802 + 1550, 880, 1335, 1552, 1600, 1830, 2010, 10K

Acanthamoeba Keratitis

Infection of the cornea, the transparent outer covering of the eye. Caused by the amoeba *Acanthamoeba castellanii*, which lives in soil, water and air, it may result in permanent visual impairment or blindness. Contact lens wearers are at risk, as well as swimmers in polluted water. 944.404579, (experimental) 6,242,044.4544

Cataracts, all types

The clouding and hardening of the lens of the eye. The proteins may become malformed (denatured) or the eyeball fluids or naturally-occurring lipids (fats) may become dehydrated. Symptoms include blurred vision, poor night vision, glare, light sensitivity, altered depth perception, and changes in how one sees colors. People in their 40s and older are most likely to develop cataracts. In the United States alone, cataracts are expected to afflict over 30 million people by the year 2020.

There are three types of cataracts. Most common is nuclear sclerotic, the very gradual clouding and hardening or sclerosis of the central (nuclear) portion of the lens. Cortical cataract refers to cloudy areas that develop in the outer edges (cortex or periphery) of the lens: fibers become opaque, forming spoke-like fissures that cause light to scatter. Subcapsular cataract forms beneath the lens capsule, or the membrane that surrounds and contains the lens. Nuclear sclerotic cataracts most often occur during the aging process. Subcapsular cataracts can be exacerbated by steroids, statins, and other medications. However, all cataracts can be triggered by age and medications, as well as by the sun's ultraviolet radiation, diabetes, inflammation, obesity, high blood pressure, smoking, and acrylamides, which form in some starchy and protein foods that are cooked at high temperatures.

Establishment medicine has no cure for cataracts other than surgery, which might eliminate the cataract but may cause vision loss for statistically high numbers of people. However, holistic therapies may help. Cataracts appear to have two categories: those related primarily to antioxidant deficiencies and those primarily related to poor quality fats. This explains why people find success with two different therapies. The antioxidant-related therapy consists of eye drops containing N-Acetyl-Carnosine (or N-Acetyl-L-Carnosine), an antioxidant amino acid found primarily in red meat. (Can-C and Brite Eyes III, brands containing that nutrient, may also help reduce pressure from glaucoma.) The lipid (fat)-related therapy consists of using a drop of organic, solvent-free castor oil in each

eye for a few months. Physician William McGarey, former head of the Edgar Cayce clinic in Phoenix, Arizona, promoted a drop of castor oil in each eye at bedtime (amount of time unspecified) to reverse cataracts.

More older than younger people develop cataracts. They tend to have more severe nutrient deficiencies (due to poor digestion and a substandard diet that includes trans fats), with more years of toxin exposure, resulting in impaired liver function (and an inability to handle fats).

If you use a laser or LED in any form, do not shine the instrument into an open eye! Aim it on the eyelid or eye socket with your eyes closed. Otherwise, you'll make your cataract worse.

Also see **BLOOD SUGAR PROBLEMS**, "Diabetes / High Blood Sugar / Hyperglycemia" and **GLANDS, Parathyroid**, "All Disturbances." Also see **BACTERIA**, "*Mycobacterium avium* / Bird Tuberculosis," and "*Bartonella quintana* / Bartonellosis / Febris Wolhynia / Wolhynia Fever / Trench Fever / Quintan Fever / Shin Bone Fever." Richard Loyd found that this pathogen can cause cataracts (as well as macular degeneration).

This single frequency has been reported as successful: 6110, run for at least one hour.

Experimental, from Jimmie Holman. Deliver frequencies in precisely the order written, for 2 minutes each. Designed to work on Pulsed Technologies equipment, they might not be as effective when used with other machines. Repeat entire set as often as desired:

40K, 99900, 98400, 95940, 93480, 91020, 88560, 86100, 83640, 81180, 78720, 76260, 73800, 71340, 68880, 66420, 63960, 61500, 59040, 56580, 54120, 51660, 49200, 46740, 44280, 41820, 39360, 36900, 34440, 31980, 40K

This set is reported to have eliminated cataracts and improve vision. 1335 (from Dr. John Garvey), 20, 160, 350, 360, 400, 496, 660 + 690 + 727, 666, 740, 784, 787, 790, 880, 1552, 1600, 1654, 1830–1860 (sweep for at least 15 minutes), 2010, 2110, 2187, 2195, 2211, 5K, 10K, 40K

Also try: 80, 325, 774, 800, 802 + 1550, 1500–1700 (sweep, at least 1 second per frequency), 2790, 2876

Catarrh

Mucous membrane inflammation in various places including the respiratory tract, gastrointestinal tract, eyes, and uterus.

380, 802 + 1550, 880, 787, 660 + 690 + 727, 380, 444 + 1865, 20, 800

Conjunctivitis / Pink Eye

Inflammation of the conjunctiva, or mucous membranes that cover the eye and inner surfaces of the eyelids. Symptoms include redness, discharge, tearing, and the feeling that there is something in the eye. May be triggered

by infection (from a virus or bacterium), allergy (to dust, pollen), sensitivity to chemical pollutants (like chlorine), or foreign object in the eye (such as a contact lens).

Sometimes pink eye is caused by viruses and bacteria that cause colds and infections of the ears, sinuses and throat, as well as bacteria that cause sexually transmitted diseases. The same organism may also be involved in lymphogranuloma venereum (venereal disease featuring inflammation and ulceration of the lymph glands), urethritis (inflammation of the urethra or urinary tube), and proctitis (inflammation of the anus). Women need to be especially careful; the infection may result in infertility or miscarriage. If they are infected while giving birth, the pathogen can be passed to infants in the birth canal and cause eye infections and pneumonia. *Chlamydia*-induced pink eye is more common in Africa and the Middle East than in the US. New findings suggest that this organism may play a developmental role in Multiple Sclerosis and cancer, so it's important to get your condition treated. Also see **BACTERIA**, "*Chlamydia pneumoniae*"; **MEN**, **Urinary**, "Gonorrhea"; "Lymphogranuloma venereum (LGV)" under **MEN**, **Penis** or **WOMEN**, **Vagina**, **Labia and Clitoris**; and "Stye" in this section.

Conjunctivitis from *Bacillus subtilis*

From Dr. John Garvey: 432, 722, 822, 1246

Conjunctivitis from *Chlamydia trachomatis*

From Dr. John Garvey: 430, 620, 624, 840, 2213
Also try: 430, 555.7, 866, 1111.4, 2222.8

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 379700 (lowest), 381K (optimal), and 383950 (highest)

Hz set: 941.18 (lowest), 944.40 (optimal), and 951.72 (highest)

Also from Clark: 18968.87

Conjunctivitis from other sources

20, 80, 489, 660 + 690 + 727, 787, 802 + 1550, 880, 1600, 1830, 10K

Cornea Inflammation

Caused by the fungus *Fusarium oxysporum*.
102, 705

Corneal Ulcer

Caused by a scratch to the cornea. May or may not be infected. The bacterium *Propionibacterium acnes* has been implicated in infected corneal ulcers.

Sweep 5996.1–6078.1 for 20 minutes. Also run 6046.9 separately for 6 minutes.

From Dr. Hulda Clark: 19267.60, 959.28

Crossed Eyes / Diplopia / Double Vision

The muscles holding the lens of the eye are weak and the focusing mechanism is faulty, often causing double vision. Eye exercises usually help. See books on the Bates method.

First try: 20, 80, 660 + 690 + 727, 787, 802 + 1550, 880, 1830, 1600, 10K

Also try: 160, 350, 360, 400, 496, 1335, 1552, 2010

Discharge, Watery

436, 595, 775, 952

Eyelid, Droopy

This may be an indication of Lyme. Also see **PARASITES, PROTOZOA AND WORMS**, "*Ascaris lumbricoides* / Roundworm" and other entries.

10K, 40K

Floaters

Tissue that has detached from the inside of the eye and is floating in the eyeball fluid, resulting in moving spots or specks in one's visual field. *Dirofilaria*, *Onchocerca volvulus*, and *Toxocara canis* (all worms) might be involved.

Also see **LIVER AND GALLBLADDER**, often related to eye conditions. Castor oil, or Christopher's Herbal Eye Formula, may help as well (see Sidebar, page 711).

From Michael Tigchelaar: 612.40, 1001.70, 1345.84, 1861.94

1830, at least 15 minutes per day.

***Fusarium*, General**

600 + 625 + 650, 746, 768

Fusarium oxysporum

Fungus causing inflammation of the cornea.

102, 332, 705, 780, 795

Glaucoma

Pressure in the eye resulting in atrophy of the optic nerve. According to the March 2001 issue of *Ophthalmology*, researchers found a *Helicobacter pylori* infection in most people with glaucoma; so see **BACTERIA**, "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer." Also see **BLOOD SUGAR PROBLEMS**, "Diabetes / High Blood Sugar / Hyperglycemia," as glaucoma can be related to diabetes. 660 + 690 + 727, 787, 880, 1600, 1830 (5 minutes each)

Inflammation

1.2 + 250, 80

Macular Degeneration

Deterioration of the macula (central portion of the retina)—the inside back layer of the eye that records the images we see and sends them to the brain, via the optic nerve. Macular degeneration is the leading cause of blindness in the US for people 55 and older.

Ophthalmologists are experimenting with 15 Hz (and sometimes 14 Hz) for one hour, using electrode patches (or metal wrapped in wet paper towels) near both eyes at the same time on very low power, less than one milliamp. Eyes should be slightly open. The power is turned up very slowly until the eyelids twitch and one experiences visual effects such as blinking lights. This might also help with cataracts. Also see **BACTERIA**, "*Mycobacterium avium* / Bird Tuberculosis": Dr. Loyd found that this microbe sometimes causes macular degeneration (and cataracts).

15 with electrodes for one hour; see above instructions.

Individual frequencies: 1828, 1830, 1832, 1834, 1836, 1838, 1840, 1842, 1844, 1846, 1848, 1850, 1852, 1854, 1856, 1858, 1860. Or, sweep 1828–1860.

Mite, Follicle / *Demodex folliculorum*

Mites live in the hair follicles of humans. Although generally harmless, they can cause inflammation in the eyelashes, external ears, and facial skin.

From Dr. Richard Loyd: 476, 1332.03, 1690.5

From Jimmie Holman. Deliver frequencies in precisely the order written. Designed to work on Pulsed Technologies equipment, they might not be as effective when used with other machines:

64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

From Hulda Clark: 682K or 1690.51 (for units unable to reach the KHz range)

Photosensitivity

Extreme sensitivity to light, which some people call sun allergy. This condition is a symptom of Chronic Fatigue Syndrome (CFS), but could also represent an advanced case of systemic *Candida*. It almost always indicates depleted or overextended adrenal glands. If you're taking prescription drugs, check to see if a so-called "side effect" makes people extra sensitive to the sun.

3 + 230, 330

Pink Eye

See "Conjunctivitis / Pink Eye" in this section.

Stye

Lump, due to inflammation or infection, formed at the base of an eyelash, or on or inside the eyelid. Apply castor oil. Also see the "*Staphylococcus*" entries under **BACTERIA**; and "Conjunctivitis / Pink Eye" in this section.

20, 350, 360, 453, 660 + 690 + 727, 787, 880, 1830, 2600, 10K

Trachoma

A debilitating, progressive, and very painful disease of the eyes caused by *Chlamydia trachomatis*. The eyelid becomes infected, inflamed, and thick. Then it becomes scarred

and inverts, and the razor-sharp eyelashes finally scratch the cornea, causing progressive blindness. Often the eyes become constantly teary, and the sufferer keeps the lids shut because any light that enters the sensitive eyes hurts.

The condition, primarily afflicting impoverished people living in unsanitary conditions, is spread mainly by flies that swarm around the eyes, and by infected hands and clothing. The World Health Organization estimates that this preventable, treatable disease affects about 70 million people in Africa, Latin America and Asia; and of that number, two million become permanently blind.

A simple, inexpensive operation, if done in time, can help prevent further scarring and blindness. Antibiotics (and perhaps colloidal silver) can help eliminate the infection, but they are generally unavailable to poor people. Try frequencies for both types of *Chlamydia*: *Chlamydia trachomatis* (which gives this eye condition its name, and is more commonly known for causing a sexually transmitted disease), and *Chlamydia pneumoniae*, in case both are involved.

Chlamydia pneumoniae

Run each frequency for 5 minutes.

Program 1: If your unit can't run decimals, round up or down to the nearest number. 4710.5, 470 to 472, 479, 620, 940.1, 942.9, 1880.1, 1885.9, 3760.3, 3771.7, 7520.5, 7543.4

Program 2: 471, 942, 1886, 3772, 7543

Chlamydia trachomatis

Also see main entry under **BACTERIA**.

430, 555.7, 620, 624, 840, 866, 1111.4, 2213, 2222.8

Vision, to Sharpen

266, 350, 360, 1830, 40K (for as long as desired)

End of Eyes section.

EXHAUSTION

See **FATIGUE / CHRONIC FATIGUE**.

—F—

FACIAL PARALYSIS

See "Paralysis in the Face" under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

FACIAL TONING

See under **SKIN**.

20

FALLOPIAN TUBE INFLAMMATION

See under **WOMEN**, *Uterus*, *Cervix*, *Ovaries and Fallopian Tubes*.

FASCIA, TO SOFTEN

See under **MUSCLES**.

FASCIOLA HEPATICA

See under **PARASITES, PROTOZOA AND WORMS**.

FASCIOLOPSIS BUSKI

See under **PARASITES, PROTOZOA AND WORMS**.

FAT ELIMINATION

See under **OBESITY / OVERWEIGHT**.

FATIGUE / CHRONIC FATIGUE

Fatigue has many causes: low iron (perhaps due to heavy bleeding from colon irritation; an abnormal menstrual cycle; a Vitamin B12 deficiency; or almost any pathogen (*Candida albicans*, *Mycoplasma*, parasites, viruses). Also check for poisoning from chemicals and heavy metals.

Besides the frequencies below, see listings related to your particular infection, condition, or affected part of the body. For fatigue that's chronic, see **VIRUSES**, "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)." Also see entries under **REGENERATION AND HEALING**, and always run 40K to restore cell function.

20, 72, 95, 125, 428, 444 + 1865, 465, 660 + 690 + 727, 40K (for as long as you want)

FATIGUE, FROM RIFING TOO LONG

Also see **SCHUMANN RESONANCES**.

1.55, 7.83

FATIGUE, GERIATRIC / ADYNAMIA

Fatigue of age, although adynamia is generally considered to be caused by adrenal gland weakness. See other "Fatigue" entries. Also see entries under **GLANDS**, *Adrenals*.

27.5 + 220 + 410, 60 + 100

FEAR

See this and other entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

FEBRIS WOLHYNIA

See "*Bartonella quintana* / Bartonellosis" under **BACTERIA**.

FEET, EXCESSIVE SWEATING

See under **SKIN**.

FELINE (CAT) IMMUNODEFICIENCY VIRUS (FIV)

See under **VIRUSES**.

FELINE (CAT) LEUKEMIA

See "Leukemia, Feline" under **CANCER**.

FELON

Infection of the fingertips consisting of pus, or dead white blood cells.

First try: 657, 659, 738, 751

Also try: 663, 665, 720, 722

FEVER, GENERAL

Normal body temperature is 98.6°F (37°C). Ordinarily, with temperatures taken orally, a low fever is considered less than 101°F (38.3°C). A moderate fever is in the 102° to 103°F range (38.8° to 39.4°C). A high fever is over 104°F (40°C). Temperatures over 106°F (41.1°C) can be harmful, particularly if they are prolonged. Fever is the body's way of producing a high enough temperature to kill invading pathogens, and to mobilize various biochemicals and immune cells in the body to help with healing. So unless the fever is abnormally high or the person is very young or frail, it's a good idea to let the fever run its course. Nevertheless, killing pathogens with frequencies will help the body restore itself.

20, 422, 800, 832, 880, 787, 660 + 690 + 727, 2112

FEVER, GLANDULAR

See **VIRUSES**, "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)." For issues pertaining to a specific gland (different from so-called Glandular Fever), see the listing for that gland under **GLANDS**.

FEVER, DUE TO SUNSTROKE

FIBROADENOMA OF BREAST

See under **WOMEN**, *Breasts*.

FIBROID CYST IN BREASTS

See under **WOMEN**, *Breasts*.

FIBROMA

See under **TUMORS, BENIGN** or **WOMEN**, *Breasts*.

FIBROMYALGIA

Fibromyalgia is a syndrome or collection of symptoms. The most prominent and major symptom is chronic, widespread pain and tenderness in the muscle fibers and connective tissue covering a large portion of the body. (An official diagnosis states that pain must be felt at over a dozen sites in all four quadrants of the body: right and left sides, above and below the waist.) Other symptoms include numbness, swelling, stiffness, aches and tingling in the tissues, limbs and joints; weakness; chronic fatigue; unrefreshing sleep; depression; anxiety; irritable colon and bladder; tension headaches; eye problems; and painful menstrual periods.

In many people, fibromyalgia is triggered or exacerbated by injury (for instance, a car accident), infections (usually

viral), hormonal imbalance, radiation and electromagnetic pollution, chemical poisoning (including drugs and smoking), nutrient starvation (as from a poor diet), allergies, or any major stress. About 90% of fibromyalgia sufferers are women. New research from neurologist Anne Louise Oaklander indicates that people with fibromyalgia suffer from damage to small nerve fibers, which causes faulty signals (and therefore pain) in nerves all over the body, including internal organs and the nerve fibers lining the blood vessels of the skin. Some now call this disorder “Small-Fiber Polyneuropathy.”

Insufficient thyroid hormone can contribute to or cause fibromyalgia. Over half the subjects who are hypothyroid suffer from excessive amounts of mucin, a sugar-protein, hydrophilic (water-loving) compound that is normally present in muscles, skin, blood vessels, nerves, and other parts of the body—including the fascia, or membranous envelopes that cover the muscles. In excess amounts, mucin damages connective tissue. Therefore, someone with fibromyalgia may be suffering from an underactive thyroid. A hypothyroid condition also contributes to fibromyalgia because an abnormally low metabolism equals an undercharged system, which will make it difficult to maintain normal body processes or retain any benefits of healing protocols, no matter how useful they might be. See **GLANDS, Thyroid**, “Thyroid, Underactive / Hypothyroidism.”

Immune dysfunction—which can be either the cause or result of infections—is also implicated in fibromyalgia. People with fibromyalgia have inadequately functioning Natural Killer T Cells (NK Cells). They suffer viral damage to calcium channels in the cellular membrane, damaged muscle fibers, and additional malfunction of the nervous and hormonal systems. In such people, intracellular magnesium and serotonin levels are low. Magnesium is needed for muscle function, and serotonin (produced during restful, not fitful sleep), is necessary for immune function.

There’s a higher than usual requirement of many nutrients. Just a few supplements that can help with one or more symptoms—such as muscle wasting, pain, joint stress, brain fog, digestive disorders, and fatigue—are magnesium, malic acid, MSM (methylsulfonylmethane), N-Acetyl Cysteine, glucosamine sulfate, and the herb *Boswellia serrata*. Enzymes may also help, taken on an empty stomach so they will be used to combat inflammation instead of digest food.

Pay attention to any possible triggering events such as an illness or accident, and treat accordingly. Mold toxins almost always cause symptoms that feel like fibromyalgia, so see various entries for mold, as well as the Insert “Mold and Lyme Toxins, and the Inflammation Response” on pages 690–691, under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

The frequencies below are compiled from M. Tigchelaar and Dr. Loyd. Also see all the “*Mycoplasma*” frequencies under **BACTERIA**, as Dr. Garth Nicolson and colleagues found these bacteria, especially *Mycoplasma fermentans*, in the blood of over 60% of people with fibromyalgia. Also see **AUTOIMMUNE DISORDERS** and **GASTROINTESTINAL TRACT, Small Intestine**, “Leaky Gut Syndrome.” Some researchers

have found a spirochete in the blood of a significant number of people with fibromyalgia, so also see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease.” Also see **CARTILAGE PRESERVATION AND HEALING**.

Run these at least 2 minutes each: 20, 40, 120, 140, 200, 320, 321, 304, 317.6, 326, 328, 384, 420, 464, 500, 600, 660 + 690 + 727, 664, 800, 880, 900, 2128, 2180, 2489, 3176 120, 140, 304, 320, 328, 420, 464, 600, 664, 728, 787, 800, 880, 1550, 2008, 2050, 2080, 2128, 2180, 2489, 2720 (for 20 to 30 minutes), 3790, 3794, 3798, 3802, 3806, 3810, 5, 6, 9, 10K, 40K (this last one, for as long as desired)

GASTRO-ESOPHOGEAL REFLUX DISEASE (GERD)

See “Acid Reflux / Gastro-Esophageal Reflux Disease (GERD)” under **GASTROINTESTINAL TRACT, Stomach and Esophagus**.

GASTROINTESTINAL TRACT

The digestive tract is a huge muscular tube extending about thirty feet from the mouth to the anus. Lining the entire tract is soft mucous membrane that protects the tubing from foreign substances. (Food is foreign until the body breaks it down and makes it a part of its own tissue.) The musculature’s involuntary, smooth, rhythmical, wave-like movement (peristalsis) pushes the food down the esophagus or food tube to the stomach, down to the small intestine, and then to the colon or large intestine.

Digestion begins in the mouth, as enzymes in saliva break down starches into simple glucose. The taste and even smell of food stimulate increased production of saliva and signal the other digestive organs to be ready to receive food—so it’s important to chew well, leaving food in the mouth as long as possible. Chewing also breaks down the indigestible cellulose coating of fruits and vegetables, liberating the nutrients. Chewing also creates more surface area on the food so digestive enzymes can break it down further. Once the food travels down the esophagus (food tube) and through a small sphincter to the stomach, the stomach churns the food and combines it with more digestive enzymes so it becomes a relatively smooth, thick fluid called chyme. The chyme moves through the opening at the lower end of the stomach

The Importance of Healing the Gut

The autonomic (automatic) nervous system has two parts: *sympathetic* (involved in fear, anxiety and dehydration) and *parasympathetic* (involved in calm, relaxation, and hydration). The sympathetic nervous system dominates in all chronic health problems, degenerative or infectious. Illness equals anxiety.

Sympathetic dominance causes poor digestion, so that even with a healthy diet, the body doesn't produce enough digestive enzymes. The large intestine—which normally extracts water from the food remnants—now diverts its blood supply to the muscles to allow subjects to fight or flee; so the colon's ability to extract water is limited. Greasy sludge then accrues on the intestinal lining, leading to inflammation that causes leaky gut. Protein particles enter the bloodstream and migrate to tissues, causing irritation and allergies. Leaky gut is a stagnant gut—the perfect breeding ground for intestinal parasites and fungus (such as *Candida albicans*), which feed on waste in the digestive tract.

Eliminating worms and *Candida* is only one step to becoming healed. The parasympathetic and sympathetic nervous systems must be balanced. If they're not, pathogens can proliferate again.

(pyloric valve) into the first section of the small intestine, or duodenum. Carbohydrates enter the small intestine first, then proteins, and then fats. Digestion and assimilation primarily occur in the first two sections of the small intestine. Then the material moves through the ileocecal valve, located at the end of the small intestine, and then into the colon or large intestine. Whatever undigested material is left leaves the small intestine and enters the large intestine as a very thick paste. The remaining usable liquid is absorbed, after which the waste collects in the rectum at the end of the large intestine, to finally leave the body through the anus.

The gut—the overall term for the digestive organs—shares an interesting relationship to the central nervous system: they both evolved independently from the same embryonic tissue. The human digestive tract and the spinal cord each contain over one million nerve cells. In fact, the digestive system contains more nerve cells (as the enteric nervous system) than the peripheral nervous system. Major brain neurotransmitters (including serotonin, dopamine, norepinephrine, nitric oxide, and glutamate) are in the gut when food is present.

The brain and the gut are also linked by the vagus nerve, a kind of “neural cable” that's the longest of all cranial nerves. The vagus nerve travels from the brain stem, through the neck and chest organs, to the abdomen. The abdominal cavity is literally a second brain, and gives physiological and biochemical validity to what we call “gut feelings.” The gut produces, and sends to the brain, pain-alleviating and mood-

altering chemicals similar to those found in drugs (or rather, the drugs attempt, unsuccessfully, to duplicate the effects of the biocompatible compounds that are naturally produced by the body.) It's not yet known whether the gut synthesizes the chemical, benzodiazepine, from compounds in foods, from bacterial action on the food, or both. By the way, serotonin in the gut catalyzes peristalsis. Drugs such as Prozac®, which divert serotonin from the intestinal tract to the brain, cause digestive disturbances.

There are about ten thousand different beneficial intestinal bacteria living in symbiosis with their host. These friendly flora produce enzymes, vitamins, and beneficial acids that aid digestion. The delicate balance of the digestive tract can be unfavorably altered by toxins that include antibiotics, chlorine, fluoride, food additives, preservatives, caffeine, and hard-to-digest foods. Scientists discovered that eliminating grains, dairy, and processed sugars from the diet (except raw honey, which has natural germicidal properties) often healed people with inflammatory bowel disease (IBD). Although only IBD was being studied, common sense states that the findings include all gastrointestinal issues.

Many conditions in the digestive tract are either caused by, or contribute to, an overgrowth of yeast and a deficiency of beneficial flora. Yeasts thrive on sugar and carbohydrates, displacing the flora that help us digest our food. Moreover, the carbohydrates induce a bodily response to create mucus, which adheres to the intestinal wall. This impedes the peristalsis of the entire intestinal tract.

The gut is the second brain. Stress contributes to poor digestion and can cause the stomach to shift its position: even a small shift can impair the production of hydrochloric acid, necessary to digest protein. Poor digestion allows pathogens to proliferate, which impedes nutrient absorption even more. Poor digestion equals poor elimination, causing gas, inflammation, severe infections, and possibly colon irritation. To those deprived of proper nourishment, the world may seem like a place where needs can never met.

Also see the following most common pathogens involved in all gastrointestinal disorders: **CANDIDA, FUNGI, MOLDS AND YEASTS**, *Candida albicans*; *Campylobacter*, *E. coli*, *Helicobacter pylori*, and *Salmonella*, all under **BACTERIA**; and frequencies for the various *Giardia* pathogens under **PARASITES, PROTOZOA AND WORMS**.

Systemic Conditions

General

The frequencies below are for pathogens that could be anywhere in the digestive tract. However, don't rely on these alone; see specific listings as well.

3.9, 4.9, 20, 72, 95, 125, 422, 450, 660 + 690 + 727, 664, 676, 784, 787, 802 + 1550, 832, 880, 1552, 2008, 2127.5

Actinomyces bovis / Actinomycosis

The *Actinomyces bovis* fungus causes Actinomycosis, an infection of the brain, lungs, gastrointestinal tract or jaw.

1.1 + 73, 20, 160, 220, 465, 787, 660 + 690 + 727, 10K

Adenovirus Infection

Causes symptoms in the lungs, stomach, and intestines. Also see **VIRUSES**, “Adenovirus, all types.”

First try: 333 + 523 + 768 + 786, 666, 959, 962

Also try long set if the above isn't sufficient: 20, 26, 48, 60, 72, 95, 125, 160 (for 5 minutes), 180, 300, 333 + 523 + 768 + 786, 444 + 1865, 522, 555, 660 + 690 + 727, 787, 802 + 1550, 880, 942, 952, 959, 962, 959 to 969, 1395 (for 5 to 10 minutes), 1500, 2050, 2720, 4868, 5K, 6989, 7001, 7009, 7702, 7762, 7767, 10K, 40K

Amoebic Dysentery / *Entamoeba histolytica*

Entamoeba histolytica is a dangerous protozoan that causes amoebic dysentery, an infection of the liver and digestive tract. Symptoms include severe diarrhea, ulcerated open wound, fever, and blood in the stool. Also see “*Salmonella*” and “*Shigella*” under **BACTERIA**.

First try (from Dr. Garvey): 148, 166, 308, 393, 631, 778
From Dr. Hulda Clark: 19168.02, 954.32

Also try: 333 + 523 + 768 + 786, 465, 660 + 690 + 727, 787, 802 + 1550, 832, 880, 1552 for co-infections.

Botulism / *Bacillus botulinum*

Botulism is a well-known and often fatal form of food poisoning from *Bacillus botulinum*. Symptoms include nausea and vomiting, intense abdominal cramping, fatigue, headache, difficulty swallowing, distorted vision, diarrhea, paralysis, and later shock and unconsciousness which lead to death. This bacterium, which produces a potent neurotoxin, can proliferate from spoiled food that has either been improperly canned or left unrefrigerated in hot weather. Also see **BACTERIA**, “*Salmonella*” and **CHEMICAL SENSITIVITY / POISONING**.

172, 518, 533, 639, 660 + 690 + 727, 683, 691, 802 + 1550, 831, 1372, 1552, 10K

Candida / Yeast

An infection of fungal and yeast forms has rightly been called the runaway illness of the late 20th century. Most Americans are afflicted by an overgrowth of yeast that ordinarily exists in very small amounts in the digestive tract but which, due to poor diet, stress and antibiotics, proliferates and crowds out beneficial bacteria. Fungal overgrowth causes a vast array of conditions including, but not limited to: faulty digestion; mood swings; overweight; cravings for sweets, alcohol or carbohydrates; depression; blurry vision; slurred speech; poor motor coordination; and an inability to focus or remember.

Yeast has been implicated in diseases ranging from hypoglycemia to cancer. According to many holistic practitioners, it is always present in AIDS and chronic fatigue syndrome. To control yeast, follow a diet of mostly fresh vegetables and some animal protein, with

a minimum of carbohydrates (starch and grains). Avoid yeast-ridden or fermented substances such as soy sauce, vinegar, cheese, alcohol, and yeasted breads (which are riddled with fungal spores). Don't eat sugar, even what naturally occurs in fruits, because fungi and yeasts—like most harmful microbes—thrive on sweet and starchy foods, which are rapidly metabolized.

Although most people call their systemic or digestive fungal infection “Candida” (short for the Latin *Candida albicans*), there are actually many different types of fungi. They all manifest differently in the body. Because unwanted fungi are prevalent in the system and can mimic so many other conditions, you may want to run fungus and yeast frequencies as part of a general gastrointestinal program. Make sure to see “*Candida albicans*” and related entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**. Remember that fungi and yeast indicate an advanced stage of fermentation within the body—the organism is literally molding—so you will need to pay careful attention to diet and acid/alkaline balance (pH). There is no single pH that's optimum for all of the tissues (see Chapter 1, pages 17–20), so see a nutritionist who is versed in metabolic typing if you need assistance.

Fermentation in the body leads to parasites and worms; so try the **PARASITES, PROTOZOA AND WORMS** frequencies along with detoxification protocols (see Chapter 3). For reference, see *The Yeast Connection*, *Candida* and *The Candida Albicans Yeast-Free Cookbook*.

Catarrh

Mucous membrane inflammation in various places including the respiratory tract, gastrointestinal tract, eyes, and uterus.

20, 380, 444 + 1865, 660 + 690 + 727, 787, 800, 802 + 1550, 880

Constipation

Digestive tract conditions can indicate the presence of *Candida albicans* and other fungal forms. See “Diarrhea and/or Constipation” in this section. Also see the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

20, 422, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880

Cramping

If the cramping is due to food poisoning, digestive disturbances or infection, rifting can help. But cramping from appendicitis requires great caution and care—see “Appendicitis” under **GASTROINTESTINAL TRACT, Colon / Large Intestine**. Also see the many entries under **PARASITES, PROTOZOA AND WORMS**; under **WOMEN, Menstruation and Menopause**; and applicable listings in this section.

4.9, 20, 26, 72, 95190, 660 + 690 + 727, 787, 832, 880, 10K, 40K

Diarrhea and/or Constipation

Diarrhea and constipation reflect an unbalanced digestive tract. They can be caused by pathogens and/or the toxins they excrete; insufficient numbers of friendly flora (which help us digest our food and even manufacture some vitamins); and mineral (electrolyte) deficiencies, which prevent the proper digestion and assimilation of food. Antibiotic drugs—which include tetracycline, amoxicillin and erythromycin—also disrupt the gut because they kill the friendly flora. While discontinuing the drugs can stop the diarrhea, you'll need probiotic supplements to help restore colon health. If you are taking medications, consult your health care provider to see if any of the medications list diarrhea or constipation as a negative "side" effect.

Food allergies and intolerances can cause abdominal disturbances, usually due to proteins that the body cannot break down into usable components. Common allergens include dairy (especially pasteurized and homogenized), soy, eggs, chocolate, citrus fruits, shellfish, and some nuts. Gluten, a protein molecule in grain that gives it an elastic texture, may cause Celiac disease, whose symptoms include recurring diarrhea and malabsorption (see Chapter 3, Food). Difficulties with fats, causing constipation, diarrhea, nausea and bloating, indicate liver and/or gallbladder issues; so see **LIVER AND GALLBLADDER**, *Liver*, or **LIVER AND GALLBLADDER**, *Gallbladder*.

Bacteria, viruses, fungi and parasites can also cause nausea, vomiting, constipation, and diarrhea. Over 134 worms and parasites alone can live in the human body. Autopsy reviews show that parasites may contribute to as much as 75% of all illness, although ordinary diagnostic tests may not detect their presence. Worms often contain bacteria, which in turn contain viruses. So even if the worms are killed, you must still deal with the smaller microorganisms that play a role in the symptom picture.

Under **BACTERIA**, see "*Campylobacter*," "*E. coli* / *Escherichia coli*," "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer," "*Salmonella* / Food Poisoning," "*Shigella*," and "*Staphylococcus pyogenes aureus*." Under **CANDIDA**, **FUNGI, MOLDS AND YEASTS**, see "*Candida albicans*." Under **PARASITES, PROTOZOA AND WORMS**, see "*Entamoeba histolytica* / Amoebic Dysentery," "*Blastocystis hominis* / Blastocystosis," "*Clostridium difficile* / Pseudomembranous Colitis," "*Cryptosporidium parvum* / Cryptosporidiosis," "*Giardia duodenalis* / Giardiasis," "*Giardia lamblia* / *Giardia intestinalis* / Giardiasis," "*Strongyloides stercoralis* / Threadworm," and "*Trichuris trichiura* / Whipworm." Under **VIRUSES**, see "Adenovirus all types," "Norwalk Virus," and "Rotavirus."

Also see, under **GASTROINTESTINAL TRACT**, *Colon* / **Large Intestine**, "Crohn's Disease" and "Colitis / Irritable Bowel Syndrome (IBS)."

Diarrhea from Dysentery

See "Amoebic Dysentery / *Entamoeba histolytica*" in this section.

Food Poisoning

See "Botulism / *Bacillus botulinum*" in this section and "*Salmonella*" under **BACTERIA**.

Giardia duodenalis / Giardiasis

The one-celled *Giardia duodenalis* lives in the intestines of animals and people worldwide, causing giardiasis, a common water-borne illnesses. Common symptoms include abdominal cramps, nausea, and watery diarrhea. There are many strains of the *Giardia* microorganism but no publicly known frequencies for *Giardia duodenalis*. Get them at dnafrequencies.com. Also try *Giardia lamblia*.

Giardia lamblia / *Giardia intestinalis* / Giardiasis

This protozoan found in the intestinal tract is the most frequent cause of non-bacterial diarrhea in North America. Infection is usually caused by drinking contaminated water or eating produce washed in contaminated water. Watery diarrhea usually occurs within a week of ingestion. Other symptoms include intestinal cramping, nausea, gas, and weight loss. Most susceptible are children and those with weak immunity. Disease normally lasts one to two weeks, although chronic infections may last months or even years.

Giardia survives best in a cool moist environment. Several strains have been found, causing more or less severe symptoms depending on the person's constitution. 334, 407, 812, 829, 1K, 2018, 4334, 5429

These frequencies are from Jeff Sutherland.

adults 430531; *larvae* 231350; *eggs* 110110

Dr. Sutherland emphasizes that the following frequencies must be used in the following sequence: 430531, 231350, 110110, 231350, 430531, to ensure that the life cycle of the parasite is completely disrupted and all stages are caught and destroyed. Sweep 200–300 Hz to accommodate the individuality of the terrain.

From Dr. Hulda Clark. Use the Hz set for units unable to reach the KHz range. With such a wide frequency range, you may want to sweep.

KHz set: 421400 (lowest), 424K (optimal), and 426300 (highest)

Hz set: 1044.55 (lowest), 1050.99 (optimal), and 1056.69 (highest)

Also from Clark: 21109.72

Indigestion / Dyspepsia

Indigestion is often caused by *Candida albicans* and parasites. The *Candida* displaces helpful intestinal bacteria, and the parasites use up nutrients that should go to the host. In addition to trying the frequencies below, see **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Candida albicans*" and relevant entries under **PARASITES, PROTOZOA AND WORMS**.

4.9, 7.83, 20, 72, 95, 125, 444 + 1865, 465, 660 + 690 + 727, 787, 802 + 1550, 880, 10K, 40K

Laxative Effect, mild

802 + 1550

Malabsorption Syndrome

Microbial overgrowth, infections, metabolic and glandular disturbances, nutritional deficiencies, and mechanical obstruction in the bowel can prevent the proper absorption of nutrients in the digestive tract. Supplement your diet with friendly intestinal flora. Consider doing colonics and consult a holistic health practitioner. Also see **PARASITES, PROTOZOA AND WORMS**, “General (unspecified)”; **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*”; and other applicable entries in this section.

660 + 690 + 727, 787, 800, 802 + 1550, 880, 1552, 3K

Nausea

If the nausea is from appendicitis, this requires caution—see “Appendicitis” under **GASTROINTESTINAL TRACT, Colon / Large Intestine**. Also see other applicable entries in this section and the many entries under **PARASITES, PROTOZOA AND WORMS**.

4.9, 20, 26, 72, 95, 190, 660 + 690 + 727, 787, 832, 880, 10K, 40K

Pain

There can be many causes. See **PAIN**.

Protozoa, Specific

See the **PARASITES, PROTOZOA AND WORMS** section.

Salmonella

See under **BACTERIA** (there are too many *Salmonella* strains to list here).

Streptococcus enterococcinum

Often present with digestive and urinary tract infections.
409, 686

Typhoid Fever

See “*Salmonella typhi* / Typhoid Fever” in this section.

Worms, Specific

See the **PARASITES, PROTOZOA AND WORMS** section.

Colon / Large Intestine

The colon or large intestine is the bottommost portion of the digestive tract. Five to six feet long with a diameter of about two inches, it's shorter than the small intestine, but being thicker and wider, it's considered “large.” The colon is divided by sharp turns into three major parts: the ascending colon (running vertically on the right side of the body), the transverse colon (running horizontally from right to left across the upper abdomen), and the descending colon (running vertically on the left side of the body, ending in the rectum). The colon squeezes every

Nutritional Support for the Digestive Tract

- ◆ **Digestive Enzymes.** With each meal, take amylase to break down starch, protease to break down proteins, and lipase to break down fats. Also take hydrochloric acid, which digests proteins, to supplement what the stomach produces (or doesn't).
- ◆ **Probiotics.** Replenish some of the friendly flora. Keep in mind that the healthy human intestinal tract contains many more beneficial bacteria than what can be taken in supplements.
- ◆ **L-glutamine.** As a powder, this amino acid helps heal the intestinal wall. It also curbs carbohydrate cravings and builds muscle.
- ◆ **Aloe Vera.** The inner leaf heals, soothes and repairs the mucous membranes. The outer leaf is a laxative.
- ◆ **Slippery Elm Bark.** Taken as a powder, mixed in water and drunk immediately, it soothes and heals the mucous membrane lining of the gut.
- ◆ **Activated Charcoal and Clay.** Bind to toxins in the gut; can be used in cases of food poisoning (see Chapter 3, **Detoxification**).

bit of salvageable water and electrolytes from food residue and excretes all waste—undigested food, dead bacteria, toxins, etc.—through the anus.

The colon's environment is naturally alkaline. Its many pockets and folds can trap *Candida albicans* and parasitic worms—as well as fecal material on which they feed—and help them proliferate. If the colon is clogged with waste, many problems can arise: constipation, diarrhea, blood in the stool, abdominal tenderness and cramping, hemorrhoids, abscesses, lethargy, loss of appetite, and sometimes joint pain, skin rashes, eye inflammation, kidney stones, and liver dysfunction.

There are many disorders of the colon. “Inflammatory Bowel Disease” is the overall term for colon inflammation, which is then divided into two presumably discrete illnesses called ulcerative colitis and Crohn's disease. Colon diseases are categorized according to which portions of the colon are affected. Normally, Crohn's is considered more serious than other colon conditions, as it involves all layers of the large intestine wall, sometimes parts of the small intestine, and even the stomach and esophagus.

What ultimately matters isn't the medical term, but how well food is being digested and assimilated, and the overall health of the digestive tissue. Many doctors recommend eliminating foods that can irritate the intestinal tract. This includes hot spices; dairy; high-caffeine chocolate and coffee; high-gluten grains (wheat, rye, barley and spelt); corn; oranges and other citrus fruits; nightshades (tomatoes, potatoes, eggplant and peppers); high-fat foods; fake foods, including aspartame; and even raw vegetable fiber, which can irritate the

mucosal membrane until the lining of the gut heals.

All colon problems can be helped by replenishing the beneficial flora. For more details on colon health and probiotics, see Chapter 3, **Detoxification**. Also see “*Blastocystis hominis* / Blastocystosis” in this section.

Abdominal Inflammation

Use these frequencies if you don't know the cause. Also see “Abdominal Pain” and “Colitis / Irritable Bowel Syndrome (IBS)” in this section.

1.2 + 250, 20, 72, 95, 105, 125, 146, 380, 428, 440, 444, 450, 465, 660 + 690 + 727, 776, 787, 791, 802, 832, 880, 1550, 1600, 1800, 1865, 2000, 2170, 2489, 2720

Abdominal Pain

General frequencies to use if you don't know the actual microbial cause. Also see “Abdominal Inflammation” and “Colitis / Irritable Bowel Syndrome (IBS)” in this section.

3, 95, 2720, 3K, 10K, 40K

Anus, Itching / Pruritus

Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*,” as this fungus tends to overgrow in the digestive tract and can cause anal itching. Also try “*Chlamydia trachomatis*” under **BACTERIA, MEN, Urinary** or **WOMEN, Vagina, Labia and Clitoris**; and “General (unspecified)” and “*Enterobius vermicularis* / Pinworm / Seatworm” under **PARASITES, PROTOZOA AND WORMS**.

20, 95, 72, 120, 125, 146, 333 + 523 + 768 + 786, 444 + 1865, 465, 522, 555, 660 + 690 + 727, 760, 773, 787, 802 + 1550, 826, 827, 835, 880, 2K, 3040, 3176, 4152, 10K

Appendicitis

The appendix is a tiny twisted tube sloping from the right side of the colon. It was once considered obsolete with no function; but now, scientists recognize that the appendix plays a vital role in the body's immune response. Specialized lymphoid follicles in the appendix produce antibodies to prevent the bacteria in the colon from infecting the small intestine and bloodstream (among other areas), particularly in early life. The appendix also helps encourage the maturation of B lymphocytes (a type of immune cell). Moreover, this tiny appendage stores (and may produce) beneficial flora, which help digest food. If dysentery, cholera, or a similar infection wipes out the beneficial flora, the appendix reserves are used to repopulate the digestive tract.

Appendicitis is inflammation of the appendix. Symptoms often include intense abdominal pain,

nausea, vomiting, fever, and increased pulse. Until recently, the conventional medical establishment (and certainly the public) believed that appendicitis indicated the presence of an intestinal blockage, and that unless the appendix was removed via surgery, it would burst and the person would die. Most conventionally trained doctors recommend avoiding eating and drinking (not that you'll want to eat or drink anyway), and to go to an emergency room immediately to receive lifesaving surgery. However, not everyone with an inflamed appendix has a blockage. In fact, many do not, which is why appendicitis sometimes heals on its own.

Research conducted since 2007 suggests that at least 70% of appendicitis subjects can avoid surgery by taking antibiotics—which used to be the treatment before surgery prevailed. Although antibiotics don't always eliminate infection, and there's a possibility of a repeating infection, surgery is much more risky, and has a higher death rate. According to Dr. Paulina Salminen of Turku University Hospital in Finland, a CT (computed tomography, also called a CAT scan) can accurately detect whether the appendix is merely inflamed or whether there's a blockage. If there is inflammation only, in most cases antibiotics (or other protocols to eliminate pathogens) are sufficient. If there's a structural impediment, or a possibility that the appendix may rupture, surgery is a more viable life-saving option. Almost 80% of appendicitis cases fall into the “inflammation only” category.

Aside from the obvious risks associated with surgery, keeping one's appendix is an advantage, considering what we now know about the organ's role in immunity. In people with their appendix intact, the recurrence rate of a *Clostridium difficile* infection is 18%. Those who have had the appendix removed suffer a recurrence rate of 45%.

One medical doctor reported that his friend with an appendicitis attack avoided both surgery and antibiotics by using an electromedical device that poured voltage (current) directly into the abdominal area, thus stimulating the cells to function correctly. (The same might be accomplished with a soft laser or LED, but I have not seen studies to corroborate this.) Everyone is different. If you are diagnosed with appendicitis, consult a doctor who is open to treating you with antibiotics or natural substitutes.

The frequencies below are good for after surgery or while you are awaiting surgery. Also experiment with frequencies for other infectious organisms. Obtain a diagnosis first so you know what to target.
10, 20, 72, 95, 522, 125, 146, 190, 380, 440, 444 + 1865, 450, 600 + 625 + 650, 660 + 690 + 727, 787, 802 + 1550, 804, 807, 880, 1570, 1770

***Blastocystis hominis* / Blastocystosis**

A one-celled intestinal parasite, *Blastocystis hominis* causes acute diarrhea and abdominal pain, often found in colitis or Irritable Bowel Syndrome. Also see “*Dientamoeba fragilis*” and “Pinworm / Seatworm / *Enterobius vermicularis*” in this section, as these parasites often appear together.

First try: 595, 13469

Then try: 210, 365, 844, 848, 1201, 1243, 5777, 11425, 11841, 11967, 13145, 13469, 21776

Cancer of the Colon

See “Colon Cancer” under **CANCER**.

***Clostridium difficile* / Pseudomembranous Colitis**

A bacteria that actually forms spores in the colon, *Clostridium difficile* produces a toxin that causes frequent, foul smelling, watery diarrhea. With more severe symptoms—bloody and mucus-filled diarrhea, abdominal cramps, and even abnormal heart rhythm—the condition is called pseudomembranous colitis. In some instances, this pathogen can migrate to the brain and cause autism in children. These conditions usually develop after the ingestion of antibiotics; the beneficial intestinal flora are overpowered by *Clostridium difficile* and other pathogenic bacteria.

387, 635, 673

Colic

Spasm in any hollow or tubular soft organ, particularly the colon. Because babies are the ones who suffer from colic, it might be inferred from this listing that it is all right to give infants rife sessions. Because an infant’s immune function is not fully developed, I advise you to monitor the baby closely, and seek professional help. Also try **PARASITES, PROTOZOA AND WORMS**, “*Giardia lamblia*” and “General (unspecified).”

10, 20, 422, 465, 660 + 690 + 727, 787, 802 + 1550, 832, 6766

Colitis / Ulcerative Colitis / Irritable Bowel Syndrome (IBS)

This condition features inflammation and disturbed muscular movement of the colon. It’s commonly accompanied by other symptoms, which can include constipation and/or diarrhea, cramps, heartburn, bloating, back pain, weakness, and faintness. Colitis can affect males and females (mostly adults), and is particularly susceptible to appearing during periods of unrelenting stress.

Lactose intolerance or allergy, the inability to digest foods that contain lactose (milk sugar), can easily cause symptoms that are very similar to those

of IBS. So if you’re eating dairy products, avoid them for at least three months and see if your condition improves. (Whereas pasteurized and homogenized dairy is poison, many, if not most, people can handle raw dairy or fermented raw dairy. See Chapter 3, **Food**, for more information.) Likewise, gluten in grains can cause equally severe symptoms; so the same suggestion applies for all glutinous grains.

There may be an emotional component. To help discharge anger and other emotions, consider psychotherapy, meditation, and stress reduction techniques. Also try the mineral lithium orotate (not the drug lithium carbonate; they are very different), which is rightly regarded as one of the most important nutrients for the brain. Because the majority of “brain” biochemicals are in the gut, lithium is worth considering. Also see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

Also see “Crohn’s Disease” in this section and **PARASITES, PROTOZOA AND WORMS**, “*Blastocystis hominis* / Blastocystosis,” as this one-celled parasite is often found in people with colitis.

20, 105, 440, 660 + 690 + 727, 787, 791, 802 + 1550, 832, 880, 10K, 40K

Colon Function, to Balance and Normalize

8, 440, 635, 880, 2500

Colon Inflammation

See “Colitis / Ulcerative Colitis / Irritable Bowel Syndrome (IBS)” in this section.

Crohn’s Disease / Inflammatory Bowel Disease (IBD)

Colon disorders are classified in part according to which areas of the colon are affected. Inflammatory Bowel Disease (IBD) describes colon inflammation, which establishment medicine divides into two presumably discrete illnesses called colitis (also called “ulcerative colitis”) and Crohn’s disease. Crohn’s is considered more serious than the others, as it involves all the layers of the large intestine wall, sometimes parts of the small intestine, and even the stomach and esophagus (the food tube in the throat).

Crohn’s consists of serious inflammation that causes abdominal tenderness and cramping, bloody diarrhea, hemorrhoids and abscesses, flatulence, lethargy, loss of appetite, and even joint pain, skin rashes, eye inflammation, kidney stones, and liver dysfunction. According to some sources, Crohn’s and IBD have an autoimmune component, in which immune cells attack the body’s own tissues.

There is very likely an emotional component as well. To help discharge anger and other emotions, consider psychotherapy, meditation, and stress reduction techniques. Also try the mineral lithium

orotate (not the drug lithium carbonate; they are very different), which is rightly regarded as one of the most important nutrients for the brain. The majority of “brain” biochemicals are in the gut, so any body-mind approach should be considered. See the beginning of this **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS** section for more details.

These colon disorders have multiple causes. In 1993, researchers at the Royal Free Hospital in London found a chronic, live measles virus infection in ulcerated parts of the colon in subjects with Crohn's. The virus apparently triggered an immune response that damages the colon's blood vessels. (Subjects are also discovered to be deficient in Vitamin A.) A 2010 study was the first of several in which researchers found *Mycobacterium paratuberculosis* (which causes chronic inflammatory bowel disease in cattle) in 100% of Crohn's subjects. In 2017, researchers at Case Western Reserve University in Cleveland, Ohio, discovered two bacteria and one fungus, plus their biofilms, in Crohn's subjects: *Candida tropicalis*, *Serratia marcescens*, and *Escherichia coli*.

Also see “Colitis / Irritable Bowel Syndrome (IBS)” in this section. You may also want to see various applicable entries under **PARASITES, PROTOZOA AND WORMS**. However, it's worth running the frequencies that we know: under **BACTERIA**, *E. coli* / *Escherichia coli* and “*Mycoplasma*, many types” (because *Mycoplasma* infections are often the beginning of autoimmune conditions); and **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida tropicalis*.” There are no publicly available lists for *Serratia marcescens*, but you can obtain its frequency from dnafrequencies.com.

Some users have found exponential benefits when augmenting Rife therapy with *Cryptolepis sanguinolenta*, a potent antimicrobial herb from Africa and Southeast Asia. It's available as a tincture. First try: 14, 20, 333 + 523 + 768 + 786, 440, 660 + 690 + 727, 802 + 1550, 810, 832, 880, 2K, 10K, 40K

Also try: 95, 60 + 100, 110, 428, 600 + 625 + 650, 680, 776, 787, 3K

Dientamoeba fragilis

A parasite that lives in the large intestine of humans, possibly related to *Trichomonas*. Many people are asymptomatic. When symptoms do occur, they include diarrhea, nausea, stomach pain and cramps, loss of appetite and weight, and fatigue. Children from 5 to 10 years old are most commonly affected.

The infection, common worldwide, presumably remains in the intestine without spreading to other parts of the body. More than one stool sample may

be needed to detect the parasite. It is spread through improper sanitation, and contaminated water and food, so wash hands after using the toilet.

Pinworm eggs can protect *Dientamoeba fragilis*, so the two microbes are often found together. Also see **PARASITES, PROTOZOA AND WORMS**, “Pinworm / Seatworm / *Enterobius vermicularis*.”

1001.42, 20113.98

Diverticulosis / Diverticulitis

Tiny pockets of intestinal tissue protruding through the muscular wall of the colon.

From Jimmie Holman. The Pulsed Technologies research team emphasizes the need for nutritional supplementation to help repair and rebuild tissues. (Some of their frequencies encourage repair.) Deliver frequencies in precisely the order written. Note that they might not work on units other than those manufactured by Pulsed Technologies:

12371.18, 20703.13, 24742.36, 24742.36, 26062.5, 27200, 27283.76, 28553.13, 29440, 29446.4, 30720, 32K, 32648.42, 34406.83, 34898.69, 35K, 36K, 38517.04, 39618.38, 40K, 41020, 41406.25, 45125, 45250, 45568.75, 47850, 48K, 48352.92, 48625, 48640, 48893.75, 49275, 49484.73, 49484.73, 49500, 49762.5, 52125, 54400, 54567.51, 57106.25, 58880, 58892.8, 61440, 64K, 65296.84, 68813.66, 69797.38, 70K, 72K, 77034.08, 79236.75, 80K, 82040, 90250, 90500, 91137.5, 95700, 96K, 96705.83, 97250, 97280, 97787.5, 98550, 98969.45, 99K, 99525

Short session; run for 5 minutes each: 154, 934 (from Dr. John Garvey). Then sweep from the 400 to 600 range for a minimum of 30 minutes.

Enterohepatitis

Inflammation of bowel and liver.

552, 932, 953

Flatulence / Intestinal Gas

Incompletely digested food creates gas that can be emitted from either the anus or mouth. Indigestion is often caused by *Candida* and parasites. The *Candida* overgrowth displaces helpful intestinal bacteria, and the parasites steal nutrients that should be available to the host. If these frequencies are not sufficient, see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*” and applicable entries under **PARASITES, PROTOZOA AND WORMS**.

20, 422, 465, 660 + 690 + 727, 676, 760, 787, 802 + 1550, 832, 880

Fluke, Intestinal

Worm appearing in the intestines and other places. 524, 854 (both from Dr. John Garvey), 15, 55, 651, 676, 844, 848, 2084, 2128, 2150, 6766

Gas, Intestinal

See “Flatulence / Intestinal Gas” in this section.

Hemorrhoid

Inflamed, swollen veins in the rectum (last section of the large intestine) that sometimes protrude outside the anus (the opening at the very end of the rectum). Symptoms may include bleeding, pain, itching, and irritation around the anus. Hemorrhoids, affecting both males and females, can be exacerbated by those who are constipated (and straining to have a bowel movement), elderly people, and pregnant women.

One effective remedy is homeopathic *Hamamelis virginiana*, dosage 6C, 12C or 30C, one pellet taken several times daily. Along with this, drinking aloe vera juice daily will help restore the lining of the digestive tract. Supplement with rutin and other flavonoids to help strengthen the blood vessels.

Other ways to shrink and eliminate hemorrhoids include: external applications of witch hazel, aloe vera, apple cider vinegar, tea tree and/or thyme essential oils diluted in coconut or olive oil, and clay packs to which apple cider vinegar and essential oils can be added. I would not rely solely on frequencies for this condition.

447 (from Dr. John Garvey), 660 + 690 + 727, 802 + 1550, 774, 880, 4474, 6117

Inflammatory Bowel Disease (IBD)

See “Crohn’s Disease / Inflammatory Bowel Disease (IBD)” in this section.

Inflammatory Bowel Syndrome (IBS)

With the many “diseases,” “syndromes” and “inflammatory” conditions of the colon, it’s no wonder that even doctors become confused by all these diagnostic labels. IBS isn’t classified as a true disease, so see “Crohn’s Disease / Inflammatory Bowel Disease (IBD)” in this section. Also see entries for your particular symptoms and pathogens, if you can get a diagnosis.

Intestinal Cancer caused by *Fasciolopsis buski*

See “Intestinal Cancer” under **CANCER**.

Intestine Inflammation

See “Colitis / Ulcerative Colitis / Irritable Bowel Syndrome (IBS)” in this section.

Irritable Bowel Syndrome

See “Colitis / Ulcerative Colitis/ Irritable Bowel Syndrome (IBS)” in this section.

Peritonitis

Inflammation of the membrane that lines the abdominal cavity, caused by infection or injury (such as perforation of the intestine). Symptoms include abdominal swelling and tenderness, severe pain, weight loss, constipation, vomiting, hiccups, and fever. Also see other entries in this section. Some sources believe that pathogens other than bacteria can cause this condition, so see applicable entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and under **PARASITES, PROTOZOA AND WORMS**.

Soothe the intestines with aloe and slippery elm bark. Don’t rely solely on the frequencies below. Also see other **GASTROINTESTINAL TRACT** entries.

From Dr. Richard Loyd: 867 (for peritonitis caused by *Porphyromonas gingivalis*, which is also prevalent in severe oral infections)

From Dr. Marty Monahan: 435, 775, 474, 529, 727, 787, 800

Also try: 660 + 690 + 727, 880

Pinworm / Seatworm / *Enterobius vermicularis*

Infests the intestinal tract. Also see “*Dientamoeba fragilis*” in this section.

422, 423, 732, 733, 827, 835, 4412

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 420950 (lowest), 423K (optimal), and 425300 (highest)

Hz set: 1043.43 (lowest), 1048.51 (optimal), and 1054.21 (highest)

Also from Clark: 21059.93

Proctitis

Inflammation and often infection in the lower portion of the colon. Symptoms can include discharge of mucus, pus or blood; anal and/or rectal pain and itching; the need to suddenly defecate; constipation or diarrhea; rectal bleeding; and fever.

This condition has many causes. See “Crohn’s Disease,” “Colitis / Irritable Bowel Syndrome (IBS),” and other entries in this section. Also see, all under **BACTERIA**, “*Campylobacter*,” “*Chlamydia*” entries, “*Neisseria gonorrhoeae* / *Gonococcus* / Gonorrhea,” “*Salmonella*,” “*Treponema pallidum* / Syphilis,” and “*Shigella*”; **VIRUSES**, “*Herpes*”; and **PARASITES, PROTOZOA AND WORMS**, “*Entamoeba histolytica* / Amoebic Dysentery.”

Trichomonas hominis

A protozoan parasite found in the intestines, causing diarrhea and dysentery. The *Trichomonas* frequencies below are for those in the genital tract. For more frequencies, go to dnafrequencies.com.

610 + 692 + 980

Tuberculosis

This highly infectious airborne disease is popularly known for affecting the lungs. However, swelling and tumor-like welts of tissue may appear not only in the lungs, but also in the meninges (the membrane around the spinal cord) and the intestines. Other symptoms include fever, cough, and difficulty breathing. The list below is abbreviated. There are many frequencies for both the disease and what are regarded as “secondary infections” springing from the disease, so also see **TUBERCULOSIS, ALL TYPES**.

First try: 369K (for the rod form, possibly used on Royal Rife’s #4 machine)

Then try: 21508.01, 2127.5, 1070.82, 660 + 690 + 727

Then try: 20, 221, 333 + 523 + 768 + 786, 465, 532, 590, 776, 787, 799, 800, 801, 802 + 1550, 803, 804, 1132, 1500, 1600, 1644, 2008, 2313, 3353, 6516

Ulcerative Colitis

See “Colitis / Ulcerative Colitis / Irritable Bowel Syndrome (IBS)” in this section.

Small Intestine

The small intestine, coiled into the abdominal cavity, is about one inch in diameter, 25 feet long, and—with its thousands of tiny hairlike projections (villi) embedded in the mucous membrane—a surface area of about 300 square yards, larger than a tennis court. It has three sections. The first twelve inches is the duodenum. The second portion, about ten feet long, is the jejunum. The third section, about fifteen feet long, is the ileum. The environment in the small intestine is alkaline.

Most digestion and assimilation occurs in the first two sections of the small intestine through the villi. Each villus contains capillaries through which small, broken-down food particles are absorbed and sent into the bloodstream, where they are then sent to all the cells of the body. The duodenum secretes a gastric hormone called cholecystokinin (CCK) when it receives fat- or protein-rich chyme from the stomach. (Chyme is partially digested food, in the form of a thick liquid paste.) CCK stimulates the digestion of fat and protein by causing the release of digestive enzymes from the pancreas and the release of bile from the gallbladder.

Wheat and other glutinous grains cause damage to the villi, even in people who don’t have Celiac disease. For

more information, see Chapter 3, **Food**, which contains the Insert “Wheat: Not a Healthy Choice” on page 313.

Bacillus subtilis

Found in the gastrointestinal tract of humans and ruminants, it survives high heat and causes cramps, nausea and vomiting, and diarrhea. It also causes eye infections.

From Dr. John Garvey: 432, 722, 822, 1246

Cancer of the Intestine

See “Intestinal Cancer” under **CANCER**.

Cholera / *Vibrio cholerae*

Vibrio cholerae causes cholera, a highly contagious infection of the small intestine. Symptoms include copious watery diarrhea—which can quickly lead to severe dehydration—vomiting, muscle cramps, and weakness. Cholera is rarely transmitted by person-to-person contact, but by contaminated water and food (often raw and improperly cooked seafood). Bacteria are found in salt water and near plankton. Epidemics have appeared in Russia, Iran, Iraq, Bangladesh, India, West Africa, Latin America, Indonesia, and other east Asian countries.

Most people manage this disease by drinking to replenish their bodily fluids. However, some become so dehydrated that fluids must be given intravenously. Keeping food clean and washing hands after going to the toilet are paramount.

First try: 843, 844 (both from Dr. John Garvey), 330, 556, 591, 660 + 690 + 727, 691, 968, 1035

Also try: 450, 802 + 1550, 787, 880

Duodenal Ulcer

See “*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer” under **GASTROINTESTINAL TRACT, Stomach and Esophagus**.

***Enterobius vermicularis* / Pinworm / Seatworm**

Infests the intestinal tract.

422, 423, 732, 733, 827, 835, 4412

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 420950 (lowest), 423K (optimal), and 425300 (highest)

Hz set: 1043.43 (lowest), 1048.51 (optimal), and 1054.21 (highest)

Also from Clark: 21059.93

Enterohepatitis

Inflammation of intestine and liver.

552, 932, 953

Flatulence / Intestinal Gas

Flatulence is the result of incompletely digested food, which creates gas that is emitted from the anus (rather than the mouth, in which case it's known as a burp). Indigestion is often caused by *Candida* and parasites. The *Candida* overgrowth displaces helpful intestinal bacteria, and the parasites eat nutrients that should go to the host. If these frequencies are not sufficient, see "*Candida albicans*" under **CANDIDA, FUNGI, MOLDS AND YEASTS** and applicable entries under **PARASITES, PROTOZOA AND WORMS**.

20, 422, 465, 660 + 690 + 727, 676, 760, 787, 802 + 1550, 832, 880

Fluke, Intestinal

Worms appearing in the intestines and other places.
15, 55, 524, 651, 676, 844, 848, 854, 2K, 2084, 2128, 2150, 6766

Gas

See "Flatulence / Intestinal Gas" in this section.

Leaky Gut Syndrome

Hyper-permeability of the intestinal wall. Due to the weakened structure and abnormally large spaces between the cells, partially digested material and toxins—which would normally be broken down and eliminated—leak into the bloodstream. Symptoms include headaches, bloating, gas, and brain fog.

Contributors to leaky gut syndrome include parasites; enzyme deficiencies; drugs (such as antibiotics, which destroy the helpful intestinal flora and encourage fungal growth); preservatives and other chemicals in food; improper diet (caffeine, soda, alcohol, sugars, excess carbohydrates and junk food); and pathogens that excrete toxins. All of these irritate and weaken the lining of the digestive tract. Avoid grains, dairy products, and sweeteners.

Herbs that help the intestinal tract heal itself include aloe vera, comfrey, and slippery elm. Supplement with beneficial intestinal flora. There are hundreds of strains in the gut, so take a variety.

See "*Candida albicans*" and other entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**; "*Helicobacter pylori* / Peptic (Stomach) Ulcer" and other entries under **BACTERIA**; and the many entries under **PARASITES, PROTOZOA AND WORMS**.

Peptic Ulcer

See "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" under **GASTROINTESTINAL TRACT, Stomach and Esophagus**.

Peritonitis

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

Trichomonas hominis

A protozoan parasite found in the intestines, causing diarrhea and dysentery. The *Trichomonas* frequencies available are for those found in the genital tract, which might be the same microorganism.

610 + 692 + 980

Tuberculosis

This highly infectious airborne disease is popularly known for affecting the lungs. However, swelling and tumor-like welts of tissue may appear not only in the lungs, but also in the meninges (the membrane around the spinal cord) and the intestines. Other symptoms include fever, cough, and difficulty breathing. The list below is abbreviated. Since there are so many frequencies for both the disease and what are regarded as "secondary infections" springing from the disease, also see **TUBERCULOSIS**.

First try: 369K (for the rod form, possibly used on Royal Rife's #4 machine)

Then try: 21508.01, 2127.5, 1070.82, 660 + 690 + 727

And then try: 20, 221, 333 + 523 + 768 + 786, 465, 532, 590, 776, 787, 799, 800, 801, 802 + 1550, 803, 804, 1132, 1500, 1600, 1644, 2008, 2313, 3353, 6516

Ulcer, Duodenal and Stomach

See "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" under **GASTROINTESTINAL TRACT, Stomach and Esophagus**.

Stomach and Esophagus

The sac-like stomach, heavily lined with mucous membranes, sits between the esophagus and the first part of the small intestine on the left side of the abdominal cavity. The stomach does not absorb nutrients from digested food (this occurs in the small intestine), but breaks down food into smaller molecules so they can be easily absorbed into the blood. When empty, the stomach (contracted and folded over on itself) has a volume of about one-and-three-quarter ounces (50 milliliters). When full, the stomach can expand to about one quart (or liter).

Each of the stomach's five sections contains different cells and functions. Stomach glands secrete hydrochloric acid, whose acidic environment activates the secretion of pepsin which digests protein. The stomach lining itself is impervious to corrosion from hydrochloric acid. About two to three quarts (liters) of gastric fluid are secreted daily. The same stomach cells that create hydrochloric acid also produce a protein called the intrinsic factor, necessary

for the assimilation of vitamin B12. The lower part of the stomach is highly acidic. Once the food moves into this section, carbohydrate digestion temporarily stops. This is why it's so important to chew food well, especially starch and sugars. The alkaline saliva in the mouth is well suited for digesting these carbs.

Like the salivary glands in the mouth, the esophagus secretes alkaline compounds to lubricate the food, allowing for a smoother passage to the stomach.

Acid Reflux / Gastro-Esophageal Reflux Disease (GERD)

Inflammation (sometimes bleeding) of the esophagus mucous membrane lining, triggered by excessively acidic or alkaline fluids, bile, or food entering upwards from the stomach. This condition may be due to a hiatal hernia or improper closure of the esophageal sphincter (which when working properly, prevents the upwards movement of the stomach's contents). Eat more frequent and smaller meals, walk after eating, and don't eat just before lying down. If symptoms are caused by a sliding hernia (the stomach out of position), drink a full glass of water immediately after rising and then jump up and down. See a good chiropractor who can adjust your stomach and put it back into place.

Over-the-counter or prescription antacids can make this problem worse. Lack of sufficient stomach acid impedes digestion of food and absorption of nutrients. The root problem must be addressed.

Sometimes this condition is caused by *Staph* or *Strep* infections in the hiatal sphincter. So see the "*Staphylococcus*" and "*Streptococcus*" entries under **BACTERIA**; and "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" and "Hiatal Hernia" in this section.

Duodenal Ulcer

See "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer" in this section.

Duodenitis

Inflammation of the duodenum, upper part of the small intestine that connects to the stomach and receives pancreatic secretions and bile from the liver to aid digestion.

223

***Fasciolopsis buski* or Fluke**

A flatworm implicated in stomach ulcers. Dr. Hulda Clark found that a majority of her clients with cancer harbored the *Fasciolopsis buski* parasite. When the parasite was eliminated, the cancer did not progress. If the parasite returned, so did the malignancy.

15, 55, 2K

From Dr. Hulda Clark: 21607.59, 1075.78 (adult and eggs), and 21508.01, 1070.82 (larvae)

Gastric Cancer

See "Stomach Cancer" under **CANCER**.

Gastritis

Inflammation of the stomach. Gastritis can be caused by a disease as serious as cancer to something less immediately dangerous, like an excess or (more commonly) a deficiency of hydrochloric acid (a secretion necessary to digest protein). It is important to determine the cause of the inflammation.

20, 422, 465, 660 + 690 + 727, 676, 760, 787, 802 + 1550, 832, 880

Gerd

See "Acid Reflux / Gastro-Esophageal Reflux Disease (GERD)" in this section.

Heartburn

Acid rising from the stomach to esophagus causes a burning sensation. Can be caused by an abnormally positioned stomach, in which case it needs to be pushed back into place—by a chiropractor trained in this technique or someone else (including you, though it's harder to do this on yourself). Another cause can be an insufficient supply of hydrochloric acid in the stomach. This causes the undigested food to ferment, causing solids and fumes to rise. Try nutritional supplements, including digestive enzymes (with supplemental hydrochloric acid), or herbs (including turmeric, fennel, ginger, and milk thistle) to stimulate stomach secretions and bile flow. See "Hiatal Hernia" in this section.

20, 72, 95, 125, 444 + 1865, 465, 660 + 690 + 727, 685, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2127.5, 2170, 2720

***Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer**

An ulcer is a sore, often filled with pus (decayed white blood cells). Most people who say "ulcer" mean the sore in the mucous membrane stomach lining or the duodenum (upper part of the small intestine that connects to the stomach). *Helicobacter pylori* can cause stomach cancer and can be present in glaucoma and arthritis. It's transmitted to and from people, dogs, cats, sheep, gerbils, and pigs.

Adjunctive therapies include colloidal silver, oregano essential oil, the probiotic *Lactobacillus salivarius*, and New Zealand Manuka (tea tree) honey. The honey should be labeled *UMF 15+* for "Unique Manuka Factor," which designates its antibacterial strength. Mastic gum tincture

from the *Pistacia lentiscus* tree works very well. Suppressed emotions such as anger inhibit gastric juice secretion which allows pathogens to grow, so consider psychotherapy. Also see “*Fasciolopsis buski* / *Intestinal Fluke*,” this section, which is also implicated in stomach ulcers. If the frequencies below don’t help, see a very different set under **BACTERIA**, “*Helicobacter pylori*.”

Most numbers below are from Dr. Loyd. To be thorough, sweep 1 Hz on each side of the main signal.

First try: 676 (20 minutes), then sweep 675–677

Then try: 321, 333, 346, 347, 352, 355, 368, 414, 432, 440, 487, 523, 558, 578, 693, 695, 705, 717, 728, 786, 878, 880, 2167, 2779, 2819, 2950, 3220, 8395.5, 10667, 1116.79, 1120.4, 1127.71, 11251.87, 14079.69, 14217.19, 14125

Also sweep 450550–454950

Hiatal Hernia

The stomach, abnormally displaced upward into the diaphragm cavity, which can lead to all kinds of digestive complications. Here’s a self-manipulation technique to help reposition the stomach, taught by a chiropractor friend of mine: Drink a full glass of water immediately after rising, and then jump up and down. Or, ask a chiropractor to teach you how to reposition the stomach manually.

Sometimes a hiatal hernia is due to *Staph* or *Strep* present in the hiatal sphincter. If this is the case, see “*Staphylococcus*” and “*Streptococcus*” entries under **BACTERIA**, and do sessions every day for at least a week to ensure that the pathogens are completely killed. Also see “*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer” in this section.

Hyperacidity of Stomach

This often mislabeled symptom picture is due to the stomach’s lack of hydrochloric acid (essential for digesting protein), which makes the stomach too alkaline and causes protein food to ferment because it’s not being digested. The fermentation causes burning, erroneously associated with over-acidity. (High alkalinity can cause a burning sensation which feels similar to the burning caused by high acidity.) Hydrochloric acid deficiency is easily corrected with nutritional supplementation.

7.82, 3 + 230, 20, 30

Hypoacidity of Stomach

Insufficient hydrochloric acid; see above.

20

Peritonitis

See under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

Shigella

A disease usually transmitted through contaminated food, and also the name of the disease-causing bacterium, which infects the gastrointestinal tract and causes nausea, vomiting, diarrhea, fever, abdominal pain, headache, dehydration, and blood, pus or mucus in the stool. Also see **GASTROINTESTINAL TRACT, Systemic Conditions**, “Amoebic Dysentery / *Entamoeba histolytica*.”

26, 621, 762, 769, 770, 802 + 1550, 832

Ulcer, Duodenal and Stomach

See “*Helicobacter pylori* / Peptic (Stomach) and Duodenal Ulcer” in this section.

End of Gastrointestinal Tract section.

GENETICALLY ENGINEERED SEEDS

A rifer purchased some bell peppers and found small black seeds in them. Normal bell pepper seeds are white, not black. The black seeds are caused by the so-called terminator gene, a feat of genetic engineering that renders the seeds sterile. The rifer accidentally left the seeds about four feet from a radiant plasma frequency machine. After an undetermined number of sessions, she noticed that the seeds had become white and puffy. Some had even started to sprout. She has since planted these seeds (I don’t know if they produced peppers). Frequencies were run for three minutes each, the number of sessions unknown. We don’t know if the seeds sprouted due to the specific frequencies, or the radiant energy.

Also try the healing and regeneration frequency, 40K.

GERIATRIC ADYNAMIA

Fatigue of age, although adynamia is generally debilitation caused by weakness of adrenal glands.

27.5 + 220 + 410, 60 + 100

GERMAN MEASLES

See “*Rubella* / German Measles / 3-day Measles” under **VIRUSES**.

Animals Naturally Use Frequencies

Many fish are able to detect prey using their lateral system as a sort of antenna. Shrimp vibrate at 40 hertz, the frequency their archenemy Pagothenia, an Antarctic fish, is tuned to. Pagothenia hones into the shrimp's wavelength and goes directly to its next meal. The shark is very sensitive to frequencies around 200 hertz, which is, coincidentally, the same as the vibrations of a helicopter rotor. Rescues at sea are made more dangerous by the song of the rotor blades summoning sharks in the area to the scene.

GINGIVITIS

See under **DENTAL, Mouth and Gums**.

GLANDERS

See under **RESPIRATORY TRACT, Throat and Lymph Nodes**.

GLANDS

The word “gland” refers to endocrine or ductless glands that secrete hormones—chemical messengers that travel through the bloodstream to give instructions to distant organs. The endocrine system links the brain to the organs that control metabolism, growth, development, and reproduction. This section deals with the structures in the body that secrete hormones: the adrenals, pancreas, parathyroid, pineal, pituitary, thymus, and thyroid. The male sex glands are addressed under **MEN, Testicles** and the female sex glands are addressed under **WOMEN, Uterus, Cervix, Ovaries and Fallopian Tubes**.

The endocrine system does not include the exocrine glands, which are salivary and sweat glands, and those in the gastrointestinal tract. The “glands” referred to in the phrase “swollen glands” are actually lymph nodes. Listings related to lymph glands and lymphatic tissue can be found under **LYMPHATIC SYSTEM**, and under **RESPIRATORY TRACT, Throat and Lymph Nodes**.

For detailed information about each gland, see the particular alphabetized entry. Note that fever of the adrenal, pineal, pituitary, thymus and thyroid glands, are entirely different from the disease called glandular fever.

General, to Balance and Normalize All Glands

1537, 40K (use 40K for as long as you want)

Adrenals

The adrenals, a pair of small, triangle-shaped glands, sit in the abdominal cavity, one on top of each kidney. Their name indicates this position: *ad* means “near” or “at,” and *renal* pertains to the kidneys. Each adrenal is more like two separate glands, because it's comprised of two parts and each part secretes different hormones with different functions. The adrenal medulla is at the center of the mass. The cortex, which comprises over 80% of the gland and produces over 50 different types of hormones, surrounds the medulla.

The medulla is the main source of the “stress response” catecholamine hormones—epinephrine (adrenaline) and norepinephrine, discussed in detail shortly.

The main output of the adrenal cortex consists of various corticoids, which include aldosterone and cortisol. Aldosterone regulates the body's salt balance and hence blood pressure. Cortisol normalizes blood sugar levels and is anti-inflammatory—except when its levels are too high, in which case it contributes to inflammation (and suppresses the immune response). Cortisol levels are designed to be highest in the early morning, gradually declining until nighttime (thus allowing for sleep). Then the levels gradually rise, reaching their peak in the early morning. When the timing of cortisol output is skewed, this is usually caused by a sleep deficit or disturbance, improper diet, and/or stress.

All hormones from the cortex are synthesized from cholesterol. (This is a good reason not to be afraid of eating high-cholesterol foods; and besides, most of the cholesterol in the body is made by the liver.) The cortex is a secondary source of androgens such as testosterone. When the male and female reproductive organs aren't producing sex hormones—such as during menopause or andropause (male menopause)—the cortex will produce these hormones in small amounts. However, the cortex was never meant to completely take over the job of the ovaries and testes. If there's a huge demand by the body, the cortex can overcompensate, and produce too much sex hormone. This can result in hot flashes.

The adrenals are intimately connected to the hypothalamus, the part of the brain that sends messages to the nervous system when there's danger. The adrenals are also intimately connected to the pituitary, which controls all the other glands. The relationship between these three is commonly referred to as the hypothalamic-pituitary-adrenal (HPA) axis. Stressors are first processed by the brain and central nervous system, which sends various messages to the adrenals. If these feedback pathways are malfunctioning, if they overreact, or if the stressor is unrelenting, the adrenals are negatively affected. Stress has the most impact on whether the adrenals remain healthy and do their job, or if they malfunction.

Adrenaline is released during acute stress and cortisol is released during chronic stress. Faced with either emotional

exertion (danger or perceived danger) or physical exertion, both the adrenal cortex and medulla produce and blend their respective hormones in specific ratios. Effects of adrenaline (epinephrine) and norepinephrine include increased heart rate, blood vessel constriction, dilation of the bronchioles in the lungs, muscle tightness, and increased metabolism. We know this pattern as the fight-or-flight response, based on biologists' observations that an animal either fights or flees when faced with danger.

Dr. Hans Selye described the three stages of stress as follows. (1) The alarm reaction, where the body detects the external stimuli. (2) Adaptation, where the body engages defensive countermeasures against the stressor. (3) Finally exhaustion, where the body has depleted its defenses. Frustrating and scary situations are usually stressful. Challenging situations can promote growth, especially if they're interesting, but they can be stressful if they're too intense or occur for too long. When one's stress tolerance is surpassed (and everyone is different), the adrenals start to malfunction. Considering how many hormones the cortex secretes and the number of functions it performs, it's not surprising that it's the cortex portion of the adrenals that tends to become the most debilitated, the soonest.

The main signs of adrenal fatigue include feeling tired for no reason; cravings for salt, sweets and stimulants; and feelings of being overwhelmed. Other signs can be blood sugar imbalances; hair loss; vertical ridges on fingernails; anxiety, nervousness or panic attacks; memory loss; rapid heartbeat; weakened immune response; muscle cramping in odd places; unexplained hair loss; acid reflux and indigestion; headaches; and light-headedness and dizziness when rising from a seated or lying down position (both related to undesirable low blood pressure). Michael and Dorine Lam in *Adrenal Fatigue Syndrome*, and Alan Christianson in *The Adrenal Reset Diet*, distinguish between early-stage adrenal issues and the life-threatening late-stage adrenal exhaustion. When the adrenal glands are initially stressed, the person may be unaware that problems exist at all. It's important to pay attention to symptoms that might initially seem insignificant, as it will be much harder later to repair these hardworking glands. People in the later stages of adrenal stress—more aptly called adrenal exhaustion—suffer from constant chronic fatigue, even after a good night's sleep. Late-stage adrenal stress sufferers are more likely to develop hypoglycemia, hypothyroidism, Irritable Bowel Syndrome, fibroids, autoimmune conditions, and even Lyme disease and cancer. One prominent sign is weight gain in the abdominal region, which is dangerous because extra unhealthy fat chokes the internal organs.

Some of the worst foods to eat are those containing caffeine: coffee, chocolate, colas and tea, which adrenally stressed people tend to crave. Caffeine may temporarily provide energy, but it's energy that's stolen from the body's own organs; and ultimately the adrenals—along with the liver and kidneys—will be even more stressed and perhaps

Nutrients and Herbs for the Adrenals

Rebuilding the adrenals takes time. Natural or functional medicine uses *adaptogens*—substances that help the organism respond appropriately to stress or a changing environment—to help with external stressors (such as toxins in the environment) and internal stressors (such as anxiety and insomnia).

- ◆ **Ashwagandha**
- ◆ **Astragalus Root**
- ◆ **Cordyceps Mushroom**
- ◆ **Eleuthero** (mistakenly also called "Siberian ginseng")
- ◆ **Gulancha** (*Tinospora cordifolia*)
- ◆ **Holy Basil**
- ◆ **Licorice Root** (do not use if you have hypertension)
- ◆ **Picrorhiza kurroa Root**
- ◆ **Rhodiola rosea Root**
- ◆ **Stinging Nettle**

To restore strength, the following are also used:

- ◆ **B Vitamins, especially pantothenic acid (B5)**
- ◆ **Trace Minerals**
- ◆ **Vitamin C** (about half of all Vitamin C intake is used by the adrenals)
- ◆ **Celtic or Himalayan Salt** (the adrenals require quite a bit of salt in order to function properly)

damaged. Some people should avoid bananas, dates and raisins due to their high potassium levels. Malfunctioning or tired adrenal glands require a strict diet of real, organic food, low in carbohydrates, with small amounts of complex carbs eaten in the afternoon and a bit more eaten at night. Exercise is beneficial, but it can make adrenal exhaustion worse for those who are suffering from an advanced stage. For people who are alternately tired and wired, moderate exercise is key; for those whose adrenals are crashed (a much more severe problem), gentle walking suffices. For all stages of adrenal distress, regular sleep and rest are crucial for healing. The previously mentioned books suggest foods and exercise for different stages of adrenal distress.

The Emotional Freedom Technique (EFT™) and many types of meditation have a high success rate in reducing stress and relieving physical and emotional problems. See Chapter 3 and Appendix A for more information.

Also see entries under **GLANDS, Thyroid**; **GLANDS, Pituitary**; and other related glands; **BLOOD SUGAR PROBLEMS**; and **BACTERIA**, "*Mycoplasma*, many types," because *Mycoplasma* infection has been associated with adrenal dysfunction. Also see **BACTERIA**, "*Borrelia*, all types / Borreliosis / Lyme Disease," as Lyme has become a worldwide epidemic and is one of the most severe adrenal stressors.

Addison's Disease / Primary Adrenal Insufficiency / Hypocortisolism

Only one in about 100,000 people have this rare condition, characterized by the inability of the adrenals to produce enough cortisol or (less often) aldosterone. The majority of the time, the cause is an autoimmune condition in which the body's immune cells attack the adrenals. Sometimes this condition is caused by a chronic serious infection. Occasionally, a steroid hormone medication such as prednisone is the culprit. Very occasionally, the problem lies with the pituitary gland or hypothalamus—in which case doctors refer to this as *secondary* adrenal insufficiency.

Symptoms, which usually (though not always) appear gradually, may include extreme fatigue, abdominal pain, nausea, diarrhea, weakness, loss of appetite and weight, low blood sugar, lightheadedness and fainting, craving for salt, muscle and joint pain, irritability and depression, darkening of the skin, loss of body hair, and sexual dysfunction. The subject is in crisis, and in danger of acute adrenal failure, when s/he experiences lower back pain, low blood pressure, vomiting and diarrhea severe enough to lead to dehydration, high potassium and low sodium levels, and eventual loss of consciousness. This is a serious illness that can lead to death.

With this condition, the glands are structurally dysfunctional and the person requires hormone medication to substitute for what the glands are unable to produce. Therefore, make sure to see a skilled health practitioner; these glands need much more than frequencies! However, you can supplement your medical care and experiment, at your own risk, with frequencies for “Adrenal Function, to Balance and Normalize,” and “Adrenal Gland Fever and Toxicity,” below.

Adrenal Function, to Balance and Normalize

20, 537, 1335, 2250, 10K, 40K

Adrenal Gland Fever and Toxicity

Compared to the other frequencies, 24K is untested. 20, 10K, 40K, 24K

Cushing's Syndrome / Cushing's Disease / Hyperadrenocorticism / Hypercortisolism

A relatively rare disorder of the adrenal glands caused by the production of too much cortisol, an adrenal corticosteroid hormone. Symptoms in humans may include upper body obesity, thinning arms and legs, fragile thin skin that bruises easily, weakened bones and muscles, severe fatigue, high blood pressure, and high blood sugar. Irritability, anxiety, and depression are also common. Women may have excess hair growth and men may have

decreased fertility. Children tend to be obese with slowed growth rates, but adults age 20 to 50 years are most commonly affected. In dogs, this condition is common. Symptoms include increased thirst, urination and appetite; panting; high blood pressure; hair loss; weakening of the heart and skeletal muscles; and susceptibility to skin infections and diabetes.

This condition is often caused by an abnormality such as a tumor (usually benign and occasionally cancerous), either on the adrenal glands or the pituitary. Normally, the hypothalamus part of the brain sends a hormone to the pituitary gland, which in turn secretes a hormone that stimulates the adrenals to produce cortisol. Cortisol performs vital tasks, such as maintaining cardiovascular function, reducing the body's inflammatory response, and regulating metabolism. However, too much of this hormone can produce the opposite effects. If any structure in the cortisol biofeedback production loop does not work properly, the body will produce excess corticosteroids.

Cushing's can also be caused by prednisone or other drugs. The possible involvement of the hypothalamus suggests emotional trauma. Establishment medicine advocates the surgical removal of tumors and cortisol-lowering drugs.

There are no known frequencies for this condition. You can try other entries, but please see a holistic doctor, naturopath, or osteopath!

Panic Attacks

Sudden intense anxiety, occurring repeatedly and with no discernable cause. This results from years of fight-or-flight adrenal response—the release of epinephrine (adrenaline)—which has become automatic and unconscious. Normally, adrenaline is released to prepare the body for physical activity (flight), which is accompanied by increased heart rate, rapid breathing, and sweating. However, because no strenuous activity is occurring, the person is left with only the symptoms: breathing difficulties, pounding heartbeat, chest pains, dizziness, flushing, lightheadedness, nausea, sweating alternating with chills, and tingling or numbness in the face. The emotional corollary is terror, fear of losing control, and feelings of dissociation or disconnection from one's body and environment. Some sources estimate that almost 2% of the American population suffers from this disorder, half of them before age 24. It appears to affect twice as many women as men.

Panic attacks indicate adrenal exhaustion. There are no frequencies specifically for this condition, but see other entries in this section, and check for other glands or systems that could be involved. Also see

BLOOD SUGAR PROBLEMS, “Hypoglycemia / Low Blood Sugar / Hyperinsulinism,” as this may also lead to panic attacks.

Pancreas

The pancreas is a small elongated organ in the abdominal cavity near the stomach. Its head is close to the duodenum and its tail extends toward the spleen. The pancreas is a primary gland involved in blood sugar disorders because it produces insulin. This hormone, which is secreted directly into the bloodstream, precisely regulates the amount of glucose that circulates through the blood at any given time. The multifaceted pancreas also secretes pancreatic juice, which contains many different substances including enzymes. The enzyme lipase digests fats, amylase digests carbohydrates, and trypsin and chymotrypsin digest proteins. The pancreas also secretes alkaline sodium bicarbonate (baking soda), which it sends to the small intestine. The sodium bicarbonate neutralizes the acidic chyme (broken down food) from the stomach, and protects the fragile enzymes in the small intestine.

Holistic doctors administer pancreatic enzyme supplementation to dismantle the coating of tumors, which is highly successful in the treatment of cancer.

For conditions involving blood sugar levels that are too high (diabetes) or too low (hypoglycemia), see **BLOOD SUGAR PROBLEMS**.

Parathyroid

The parathyroid gland usually consists of two pairs of small round tissue (sometimes there are more), attached to the thyroid gland on either side of the throat. Medical researchers believe that the parathyroid has one function only: to regulate the balance of minerals in the blood—namely calcium, phosphorus and magnesium—within a very narrow range so that the nervous and muscular systems work properly. Calcium does much more than build bone; it's used for many metabolic functions. Therefore, when blood calcium levels drop below a certain point, calcium-sensing receptors in the parathyroid gland are activated, a hormone is released that causes the breakdown of bone, and calcium is released back into the blood. The parathyroid balancing mechanism also helps to compensate for excesses or deficiencies of Vitamin D and essential fatty acids.

Parathyroid dysfunction can cause either an excess or a deficiency of calcium. If the parathyroid gland is overactive (more common than underactivity), too much parathyroid hormone is released. This produces too much calcium and too little phosphorus in the blood, causing the removal of calcium from the bones with symptoms that include bone weakness, muscle weakness, and heartbeat abnormalities. If the parathyroid is underactive, insufficient parathyroid hormone is released. This produces too little calcium and too much phosphorus in the blood, leading to a deficiency of usable calcium that causes muscle problems and convulsions.

General symptoms of a mild parathyroid imbalance include weakness, fatigue, aches, and depression. Symptoms of a severe condition also include abdominal pain, nausea, vomiting and constipation; loss of appetite; excessive thirst; excessive urination; bone pain; muscle aches; high blood pressure; and confusion, impaired memory, stupor, and delirium. Thinning of bones, which leads to increased risk of fracture, is common.

Allopathic medicine treats this condition by removing the gland. To function properly, the parathyroid needs sufficient Vitamin D—which can be obtained through diet or direct exposure to sunlight—and Vitamin F (see Chapter 3, page 434).

All Disturbances

Pineal

The pineal is a tiny gland shaped a bit like a pine cone, located near the center of the skull between the two brain hemispheres. Medical textbooks refer to the pineal gland as a “third eye” because in the first several weeks of embryonic life, it appears in the middle of the forehead and quite literally looks like an eye before it recedes back into the brain later. The pineal gland produces the hormone melatonin (derived from the amino acid tryptophan), which is responsible for the circadian rhythms or biological time clock of the body. Melatonin, which can be produced only in darkness, plays a major role in sexual development and metabolism as well as restful sleep.

The pineal is large in children but starts to shrink during puberty, often calcifying in adults. Some people take oregano oil and neem extract to decalcify the gland. Anecdotal accounts ascribe that ability to skate liver oil too.

Make sure to filter fluoride out of your water, avoid fluoride in dental supplies, and detoxify from fluoride. This dangerous compound tends to collect in the pineal gland and suppresses the production of melatonin and serotonin. One source recommends the mineral boron, a “pinch” of boron powder taken in 2 glasses of water, three times a day. The maximum amount that the FDA recommends is 1/8 teaspoon for a 100-pound person, and 1/4 teaspoon for a 200-pound person. If the pineal truly is an interface with more subtle energies, then decalcifying it will bring in more light—and more information.

Pituitary

The pituitary is a pea-sized, but very powerful gland sitting in a small bony cavity at the base of the brain. Hormones released by the hypothalamus in the brain stimulate one part of the pituitary to secrete hormones that regulate a wide variety of bodily functions: blood pressure, growth, metabolic functions, male and female sex organ function (including some aspects of pregnancy and childbirth), breast milk production, thyroid gland function, water balance in the body, and the stimulation of other endocrine glands. The anterior pituitary secretes many different substances: prolactin, follicle-stimulating hormone, luteinizing hormone, thyroid-stimulating hormone, adrenocorticotrophic hormone (commonly known as ACTH), and endorphins. Another secretion,

human growth hormone (HGH), plays an important role not only in growth, but also in aging and the smooth functioning of the rest of the body. Another part of the pituitary does not produce its own hormones, but stores and releases the hormone oxytocin and the antidiuretic hormone ADH (also known as vasopressin).

The pituitary was once called the “master gland” until it was discovered that the hypothalamus—involved in any stress-related response—governs the pituitary. Therefore, consider meditation or therapies that address the emotions.

Thymus

The thymus is a soft, pinkish-gray, two-lobed gland located in the upper front portion of the chest cavity. This gland is most active during puberty, after which it shrinks in size and activity in most individuals and is replaced with fat. In an adolescent, the thymus weighs about 11/4 ounces (35 grams). In someone seventy years of age, the thymus weighs about 1/5 of an ounce (6 grams).

The thymus gland contains lymph tissue and is actually part of the lymphatic system. It plays a major role in immune function by producing T cells (T is for “thymus”) that destroy pathogens, and hormones that help with immunity. The thymus is highly affected by the emotions. Medical authorities consider it normal that the gland atrophies as we age, but proper nutrition and love will help ensure that the gland (and immune function) remain vital. Light rhythmic thumping on the chest can stimulate the thymus to work more efficiently. For more information on the lymphatic system, see Chapter 3, **Exercise**.

Thyroid

The thyroid is a butterfly-shaped gland in the throat with most of its mass on either side of the centrally located Adam’s apple. The gland produces T4 or thyroxine, which is considered a relatively inactive “storage” hormone but is converted to the potent and biologically active T3 (triiodothyronine), T2, and T1.

T4 is only about one-quarter as potent as T3. Together, they heat the body, speed oxygen consumption

and heart rate, assist with growth and development, and encourage resistance to infection. The thyroid is essential for the normal function of cells, muscles, brain and nervous system, although thyroxin is most known for encouraging the metabolism of carbohydrates, fats, proteins, electrolytes and water, and helping the body take in nourishment and eliminate waste speedily and efficiently. Most T4 is converted into the more active T3 by the liver, kidneys, and some other body cells. T2 stimulates metabolism. One animal study showed that T1 cools the body and slows the heart. Together, all four of these related hormones act synergistically in ways not yet fully understood.

There's another thyroid hormone, Reverse T3 (RT3), which—like “regular” T3—is produced from T4 (usually in the liver). As its name implies, RT3 is a mirror image of T3, and they both latch on to the same receptor sites in the body. However, RT3 is inactive. It's created specifically to eliminate any unneeded T4. Every day, about 40% of T4 is converted to T3 while 20% is converted to RT3 (though these amounts vary). The problem is, precisely because RT3 isn't active, it can displace valuable T3 and prevent the cells from getting the hormonal activity they need. Many factors can cause the body to produce too much RT3. One is stress, which can involve too much or (eventually) too little cortisol in the bloodstream—both of which, for different reasons, cause an overabundance of RT3. Another is toxicity from heavy metals: cadmium, lead, mercury. (When heavy metals are removed from the body, RT3 levels fall and T3 levels rise.) Yet another cause is low iron levels. Low-iron red blood cells cannot circulate T4, which accumulates so much that the body must produce even more RT3 to clear away the excess T4. See Janie A. Bowthorpe's book *Stop the Thyroid Madness* or her website, stopthethyroidmadness.com.

The thyroid influences, and is influenced by, other endocrine glands (parathyroid, adrenals, pituitary and sex glands), and the hypothalamus portion of the brain. According to conventional medicine, the production of thyroid hormone depends on a complex hormone feedback loop. The process starts in the hypothalamus, which releases TRH (thyrotropin-releasing hormone) to stimulate the pituitary gland in the brain's center. The pituitary monitors blood thyroid hormone levels. If there's not enough thyroid hormone in the blood, the pituitary secretes TSH (thyroid-stimulating hormone) to induce the thyroid gland to produce more hormone. After the pituitary detects sufficient thyroid hormone in the bloodstream, it decreases production of TSH so the thyroid produces less hormone. The problem with this allopathic scenario is that even with normal blood levels of thyroid hormone, one may still have symptoms of a malfunctioning thyroid (it's usually underactive). In addition, the two lobes of the thyroid gland can function independently. If one lobe is *hypoactive*, the other lobe can become *hyperactive* to compensate (or vice-versa). Abnormalities such as this help explain why thyroid

Nutrients Critical for Thyroid Hormones

- ◆ **Iodine.** Helps create thyroid hormones. (Used by every hormonal receptor site of the body, it strengthens teeth and hair, forms healthy skin, boosts immunity, regulates blood sugar levels, supports the fetus during pregnancy, flushes heavy metals and other toxins, combats radiation, and even makes us smarter. There's a high uptake of iodine in the reproductive organs (especially ovaries and cervix), breasts, blood, lymph, bones, gastric mucosa, adrenals, prostate, thymus, lungs, bladder, kidneys, and skin. Iodine is a potent germicide in sea food and seaweeds, especially dulse and kelp. Women require more iodine than men: estrogen, prevalent in women, inhibits iodine absorption.
- ◆ **Zinc, Vitamin E, Vitamin B6** help T4 convert to T3.
- ◆ **Selenium** helps with T4–T3 conversion and reduces thyroid antibody levels in autoimmune disorders.
- ◆ **Tyrosine** (an amino acid) helps produce thyroid hormones.
- ◆ **Vitamins D and A** help activate T3 at nucleus of cell.
- ◆ **Iron** prevents T3 from becoming rT3.
- ◆ **Vitamin C, Vitamin B2, and Magnesium** help pull iodine into the thyroid gland. **Vitamin C** also improves the absorption of iron (see above).
- ◆ **Myo-inositol** improves cellular sensitivity to TSH (thyroid-stimulating hormone).

Note: there are other, “secondary” nutrients that act in synergy with the above, provide support for the thyroid not specific to hormone production, and are often depleted due to thyroid dysfunction.

hormone substitution (medication) may not be helpful, while herbs that help balance the thyroid gland work far better.

About one-third of the Earth's population live in iodine-deficient areas as defined by the World Health Organization. This correlates to the rise in thyroid disorders. Dr. David Brownstein states that 94.7% of 500 people he tested were deficient. Iodine helps the body synthesize, store and secrete thyroid hormone. An antiseptic, it coats and neutralizes allergenic proteins, and helps protect the system against cancer and autoimmune diseases. In the stomach, it deactivates all biological and most chemical poisons. Several leading holistic doctors say that iodine is required daily in milligram (mg), not microgram (mcg), amounts. The iodine form is utilized best by most body tissues, although the thyroid needs potassium iodide. If you're not getting enough in your diet (sea food and seaweed are excellent sources), supplement with liquid and/or tablets.

Several substances severely disrupt thyroid function. Fluoride interferes with the body's ability to utilize iodine. Goitrogenous vegetables—the brassica family (cauliflower, Brussels sprouts, cabbage, broccoli, mustard greens) and rutabagas, radishes and turnips—interfere with thyroid hormone production when eaten raw in large amounts. (Boil the vegetables to destroy the thyroid-inhibiting compounds.) Estrogenic compounds (which also interfere with immune response) are in plastics, some drugs, and soy (see Chapter 3, **Food**). Animals raised for food that eat even organic soy may cause thyroid problems.

Goiter

Goiter, enlarged thyroid gland tissue, can grow to be the size of tennis balls or larger. Allopathic medicine teaches that goiter results from undesirably high levels of TSH (thyroid-stimulating hormone) produced by the pituitary, which prods the thyroid gland to produce excessive amounts of thyroid hormone—thus causing the gland to grow abnormally. However, some people with goiter show normal thyroid hormone and TSH tests. If there's not enough iodine in the diet the thyroid will swell, trying to filter more blood to obtain the iodine it needs. Thus, insufficient dietary iodine can cause the thyroid to grow unnaturally.

Experts outside the United States recognize that goiter is generally due to an iodine deficiency. Goiter is less prevalent in those living at or near a seacoast. For two centuries (until recently), goiter was treated successfully with Lugol's solution (potassium iodide) and desiccated thyroid. Iodine is in sea food and kelp (which also comes in supplement form). See a practitioner so you don't overdose on iodine.

Goiter may also be caused or exaggerated by infection. It is often the most common manifestation of a larger constellation of conditions, one of which is Graves' disease (called Basedow's disease in Europe).

To support thyroid function: 160, 40K

If due to other causes: 20, 160, 660 + 690 + 727, 787, 880, 16K

Graves' Disease / Basedow's / Diffuse Toxic Goiter

Graves' disease—named after the Irish physician who described it in the *London Medical Journal* in 1835—is known as Basedow's disease in Europe and thyrotoxicosis worldwide. The term “diffuse

toxic goiter” describes the condition rather than the discoverer. “Diffuse” refers to the entire gland that's involved in this condition. “Toxic” describes a condition reminiscent of infection and fever. “Goiter” is an abnormally large thyroid gland.

The most common cause of hyperthyroidism in Canada, Graves' affects about one in every 100 people, and more females than males. In addition to the other problems of hyperthyroidism (see the next page), symptoms include muscle weakness, thyroid enlargement (goiter), and eye problems, such as sensitivity to light, diminished vision, and double vision. The inflamed eyeball tissue gives the eyes the familiar bulge characteristic of this disorder.

Graves' is an autoimmune-related form of hyperthyroidism (although not everyone who's hyperthyroid has Graves'). In an immune-healthy body, lymphocytes (lymph immune cells) and NK (natural killer) cells target and destroy pathogens. They also prevent the production of harmful thyroid-stimulating (and other abnormal) antibodies. But with immune-impaired Graves', the lymphocytes don't function properly. They produce abnormal thyroid-stimulating antibodies, which attack proteins on the surface of thyroid cells. In response, the thyroid cells produce too much hormone, which in turn over-stimulates the thyroid. (The swelling of skin, eyes, or other body parts is caused by antibodies attacking the body's own tissues.) Even if most of the thyroid gland is removed, it can still become overactive again because the abnormal thyroid-stimulating antibodies that caused the hyperactivity in the first place are still being produced by the lymphocytes. Often, symptoms of Graves' intensify and then disappear.

Allopathic doctors treat an over-stimulated thyroid in three ways: surgery (removal of most or all of the thyroid gland), drugs (which suppress thyroid hormone production or block the effects of excess hormone on the heart, blood vessels and nervous system), or destruction of the gland (with radioactive iodine). If goiter threatens to block the windpipe (trachea) or food passage (esophagus), people receive a thyroidectomy. About 80% who receive radioactive iodine become hypothyroid, and must take thyroxin drugs for the rest of their lives.

Sometimes people manage Graves' with Acetyl-L-Carnitine, an amino acid that helps correct the immune response. New evidence suggests that minute amounts of (non-radioactive) iodine may also help, because the thyroid gland tends to overwork (and then quits working altogether) when it does not receive sufficient nutritional support. In some cases iodine makes the condition worse, although this is usually a temporary setback. As this is an immune response problem (which happens to manifest in the

thyroid gland), see a qualified health practitioner!

Graves' is also being managed with the essential trace mineral lithium orotate—which is safe and vital to the proper functioning of the body, unlike the harmful drug lithium carbonate.

There are no known frequencies for Graves' at this time. See "Hashimoto's Disease / Autoimmune Thyroiditis" and other entries in this section; **AUTOIMMUNE DISORDERS**; and **CHEMICAL SENSITIVITY / POISONING**. Also see the myriad pathogens implicated in autoimmune thyroid conditions: **VIRUSES**, "Coxsackie B" and under **BACTERIA**, "*Mycoplasma*, many types," "*E. coli* / *Escherichia coli*," "*Helicobacter pylori* / Peptic (Stomach) Ulcer," and "*Yersinia* infections, other (unspecified)."

Hashimoto's Disease / Autoimmune Thyroiditis

Hashimoto's is a chronic autoimmune condition, caused by abnormal antibodies in the bloodstream that attack and destroy healthy thyroid gland tissue. As a result, the gland is unable to produce enough hormone. In most cases, symptoms are similar to those of hypothyroidism: fatigue, forgetfulness, dry brittle hair, hoarseness, painful stiff joints, muscle weakness, face swelling, sensitivity to cold, pale dry skin, weight gain, constipation, muscle cramps, depression, and (in women) menstrual disorders.

Sometimes Hashimoto's develops in response to a lack of iodine, whereby the thyroid swells (a condition known as goiter) in its effort to filter more blood to obtain the iodine it needs. If iodine is then ingested, the now larger thyroid gland increases thyroid hormone production. This may account for the occasional swings between thyroid underactivity and thyroid overactivity. However, mostly the thyroid gland gradually atrophies, either becoming underactive or ceasing to function altogether.

Allopathic treatment consists of synthetic thyroid hormone. A holistic approach provides nutritional support. It can include: PRPs (transfer factors), glutathione, fish oil, and Vitamin D. Sufficient copper helps the body process iodine. Recent research shows that many Hashimoto's sufferers are deficient in selenium. Just 200 mcg of selenium daily significantly reduces thyroid antibody levels. Also, myo-inositol supplementation improves cellular sensitivity to TSH (thyroid-stimulating hormone).

Avoid glutinous grains! In *Why Do I Still Have Thyroid Symptoms*, Datis Kharrazian cites research showing that the molecular structures of gluten and the thyroid gland are similar enough that gluten in the gut can trigger the body to attack the gland.

The frequencies below are experimental. Also see "Graves' Disease / Basedow's / Diffuse Toxic Goiter" and other entries in this section; **AUTOIMMUNE DISORDERS**; and **CHEMICAL**

SENSITIVITY / POISONING. Also see the many pathogens implicated in autoimmune thyroid conditions: **VIRUSES**, "Coxsackie B" and under **BACTERIA**, "*Mycoplasma*, many types," "*E. coli* / *Escherichia coli*," "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer," and "*Yersinia* infections, other (unspecified)."

Thyroid Gland Fever

20, 160, 660 + 690 + 727, 1570, 10K, 16K, 40K

Thyroid, Overactive / Hyperthyroidism

Overactivity of the thyroid gland, which causes too much thyroid hormone to be produced. The thyroid controls many body functions, so increased levels can be serious. Symptoms can include weight loss, profuse perspiration and sleeplessness (due to increased metabolism); irregular heartbeat, high blood pressure, chest pain, and even heart failure (because the circulatory system is working faster); and diarrhea (due to increased bowel function). The overstimulated nervous system causes irritability, nervousness, jitteriness, emotional angst, and mental disorientation. Despite increased appetite, the person usually loses weight because the increased breakdown of body proteins occurs too rapidly to be replenished by food.

To inhibit an overactive thyroid, doctors once administered fluoride, a poison. Goitrogenous vegetables (broccoli, cauliflower, mustard greens, kale, Brussels sprouts), eaten raw or undercooked, suppress thyroid hormone output as well.

Hyperthyroidism can be caused by Graves' disease (a faulty autoimmune response), nodules or goiters on the thyroid, excessive thyroid medication given to people with an underactive thyroid, iodine toxicity (too much iodine or an intolerance to certain forms of iodine), or thyroiditis (inflammation of the thyroid). This is not something to self-treat! See a health care practitioner.

0.5, 3, 20, 160, 40K

Thyroid, Underactive / Hypothyroidism

"Hypothyroidism" may be regarded as a catch-all term that describes both underactivity of the gland itself, and the inability of the body to utilize thyroid hormone. In either case, the symptoms are the same. Malfunctioning metabolism means impaired temperature regulation. This manifests

in weight gain (and occasionally weight loss), along with intolerance to both heat and cold—particularly in extremities where there's impaired circulation. (The person subjectively feels chilly, and the hands and feet feel cold to another person's touch.) The body also has difficulty repairing damaged tissues. This is why so many hypothyroid people suffer from structural weaknesses: brittle nails, brittle or scant hair (including baldness), degenerating bones (osteoporosis), malformed bones (scoliosis), and thinning and loss of eyebrows, notably the outer third. Physical signs of hypothyroidism also include puffy face and lips, dry skin, fatigue and lethargy, and slowed movements and speech.

Because thyroid hormones are intricately related to virtually every bodily function, hypothyroidism can cause or exacerbate conditions that initially might not seem related to each other: autoimmune conditions (such as allergies, lupus and rheumatoid arthritis), blood sugar disorders, cancers, cardiovascular disturbances (including coronary artery disease and congestive heart failure), dental problems (including chronic gum infections and temporomandibular joint or TMJ dysfunction), gastrointestinal disorders, hoarseness, sleep apnea, immune response malfunction leading to increased infections (such as *Candida albicans*), mental and emotional problems (including confusion, depression and mood swings), neurological impairment (including Multiple Sclerosis, deafness, tinnitus and vertigo), headaches and migraines, pain in joints and muscles (including arthritis, carpal tunnel syndrome and fibromyalgia), reduced perspiration, reproductive disorders (such as birth defects, endometriosis and infertility), respiratory conditions (including asthma, pneumonia and chronic sinus infections), skin disorders, and urinary tract problems (including infections, and kidney failure due to scarred shrunken kidneys).

Hypothyroidism was first reported in London in 1875. According to doctors Broda Barnes, James Howenstine, David Derry, Jacques Hertoghe and others, at least one-half of the US population suffers from slight to severe hypothyroidism. Some practitioners distinguish between two different types. In Type 1, the thyroid does not produce sufficient amounts of hormone to maintain "normal" blood levels (which in turn maintain normal blood levels of thyroid-stimulating hormone or TSH, produced by the pituitary). In Type 2, the thyroid gland produces adequate hormone, but the cells are unable to utilize the hormone properly. Some experts call this thyroid hormone *resistance*.

The body fails to accept or utilize thyroid hormone for many reasons. The mitochondria—energy-burning units of the cell responsible for about

90% of our energy production—may be impaired. Mitochondrial defects are common in iodine-deficient people. The defects can also be caused by environmental toxins, including petroleum, pesticides, organic solvents, and mercury and other heavy metals. (More women than men suffer from hypothyroidism because, due to estrogen, they are more susceptible to autoimmune disorders—and many thyroid conditions are autoimmune-based.) Faulty thyroid receptors on the cell membranes can also cause hypothyroidism by making it impossible for enough hormone to enter a cell's nucleus, where genes are activated and protein synthesis occurs. Finally, abnormally high levels of mucin cause disease conditions in over 55% of hypothyroid subjects. Mucin is a sugar-protein compound that readily absorbs water and is normally present in different types of connective tissue everywhere in the body: in the lining of blood vessels, in the nerve sheaths, in the fascia enveloping the muscles, in mucous membrane linings of the respiratory tract (such as the sinuses), and in the gastrointestinal and urinary tracts—not to mention every single organ and gland. When present in normal amounts, mucin isn't a problem. In excess, it damages the connective tissue wherever it accumulates. This helps explain the diversity of hypothyroidism-related conditions, which include Lupus and congestive heart failure.

Inadequate thyroid hormone at the cellular level negatively impacts other glands. To compensate for the weakness and low metabolism caused by insufficient thyroid hormone, the adrenals especially (along with the sympathetic nervous system) overwork. This may cause a temporary rapid heartbeat, hyperactivity, or restlessness—until exhaustion occurs from the unnatural attempts to compensate for low thyroid hormone levels. Often, the majority of sufferers simply feel fatigued and weak most of the time. This is why it's important to support other organs and glands, especially the adrenals, when treating hypothyroidism.

Hypothyroidism can be worsened by constant low body temperature and a diet high in carbohydrates, gluten, dairy, and soy. Radiation from nuclear bomb "testing" or X-rays can damage even a healthy gland, because radiation creates radioactive iodine that displaces, on the cell receptor sites, non-radioactive iodine that the thyroid urgently needs.

Lab tests showing inadequate bloodstream levels of thyroid hormone make it easy to diagnose Type 1 hypothyroidism. However, lab tests can't detect Type 2 hypothyroidism because the bloodstream might register adequate hormone levels, despite the body tissues' inability to utilize it. Therefore, the best hypothyroidism test (developed by Dr. Barnes) is to take the armpit temperature before rising

every day for at least one week. If the temperature averages lower than 97.8°F (about 36.6°C), the person is hypothyroid. One can be hypothyroid with a near-normal basal temperature; but this test is still the most accurate diagnostic tool. One's symptoms and clinical picture provide the definitive diagnosis, not an arbitrary number in a laboratory test.

In Europe, diagnoses of hypothyroidism can be rare. Doctors first investigate adrenal exhaustion, chemical toxicity, and pathogens. Often, after treatment hypothyroidism is no longer an issue. In the US, medication is freely prescribed. Prolonged administration of synthetic thyroxin (T4) is the least valuable remedy, and may shut down the gland entirely. The most effective medication is whole desiccated thyroid (from pigs) made from the entire gland and its contents: all forms of thyroid hormone, RNA, DNA, and co-factors (which all work synergistically with each other). An alternative is compounded T3 and T4, in the same ratio as that of a functioning gland. However, synthetic T3 is known to cause "side" effects such as severe hip pain.

A large portion of the T4-to-T3 conversion takes place in the liver, so a liver detox protocol is wise. To eliminate debris, sauna therapy also works well. Sweating reduces the waste removal burden on the kidneys, liver, and eliminative organs. See Chapter 3, **Detoxification**, and my book, *The Holistic Handbook of Sauna Therapy*.

Avoid chemicals that lower thyroid function. These include fluoride (in municipal drinking water, most toothpaste, some bottled teas, and even the older non-stick cookware); chlorine (in municipal drinking water, swimming pools and spas, chlorine bleach, and commercially processed chicken); and bromine/bromides (in commercial baked goods, soda pop, some plastics, fire retardants used in children's nightwear and some furniture, and pesticides containing methyl bromide).

Read *Solved: The Riddle of Illness*, and see a holistic medical doctor. Often, other glands in a delicate balance with the thyroid are involved, such as the adrenals, sex glands, and pituitary.

GORDONA SPUTI

See under **BACTERIA**.

GOUT

A metabolic disorder of excess uric acid—either because the body makes too much, or not enough leaves in the urine. Gout is a form of arthritis. The excess uric acid is in the bloodstream and also lodges inside the cells, disrupting the function of the tiny fuel-burning mitochondria. The chief symptom is inflammation of the joints, and often includes swelling of the large joint of the big toe.

For symptomatic relief, conventional medicine advises a low purine diet. Meats and seafood highest in purine include anchovies, herring, sardines, scallops, duck, goose, and organ meats—liver, brains, kidney, and sweetbreads (the thymus gland). Dried peas and legumes are also rich in purine. Therefore, people are advised to eliminate these foods entirely or to limit intake to 3 or 4 ounces per meal. Abstain from alcohol. Also, avoiding sugars—in particular fructose—is critical to getting well, because fructose causes the body to produce high levels of uric acid. See Chapter 3, **Food**, "Natural, Refined, and Artificial Sweeteners" for more information. Cherry juice has been reported to reduce uric acid levels, but it still might contain too much sugar.

Drink plenty of water to dilute the uric acid in the bodily fluids and flush it out of the system. Structured water is best; see Chapter 3, **Water**.

GRIPPE

See "Influenza" under **VIRUSES**.

GULF WAR SYNDROME / GULF WAR ILLNESS

A communicable, contagious, and potentially lethal constellation of chronic debilitating symptoms reported by troops from the United States, Britain, Denmark, Canada, Saudi Arabia, Egypt, Australia, and other countries who served in the 1991 Persian Gulf Operation Desert Storm. Cell biologist Garth Nicolson's 1996 estimate of 100,000 to 200,000 American veterans who became ill (with more than 15,000 dead) does not include infected family members and friends who became disabled or died. Half of the spouses, all of the children, and even pets of the veterans became sick. Sixty-five percent of the children subsequently born to veterans either died or had crippling birth deformities (one or more limbs missing, only one eye, etc.). Symptoms include disabling fatigue; muscle and joint pain; night sweats; fever; abdominal bloating, diarrhea and vomiting; memory and concentration impairment; Parkinson-like symptoms and paralysis; headache; skin rash; respiratory conditions similar to bronchitis and tuberculosis; vision impairment; cancerous tumors; and mental issues including irritability, violent behavior and depression. The symptoms can take six months or even years to develop, and most doctors do not have the training or experience to diagnose this disease.

Major stressors such as chemical exposure, injury, and vaccines (which themselves contain pathogens) can stimulate the onset of illness. Dr. Joseph Mercola believes that the combination of aspartame-ridden soft drinks, vaccines, nerve gas "antidotes," and insecticides—along with biowarfare microorganisms—created this condition. However, the most direct and serious cause may be genetic engineering. In the blood of Gulf War veterans, Dr. Nicolson discovered *Mycoplasma fermentans incognitos*, an unusually venomous microbe that's difficult to detect. It contains a highly unusual retroviral DNA sequence: just a portion (40%) of the HIV-1 genetic code, and just the envelope gene. (The HIV-1 virus is unable to replicate with only one envelope gene.) This minute amount of genetic material is powerful enough to give someone symptoms of AIDS but test negative for HIV. Nicolson and his molecular biologist wife, Nancy, present compelling evidence that *Mycoplasma fermentans incognitos* is only one of about 15 dangerous *Mycoplasma* that may have been employed during Desert Storm. These manufactured pathogens have existed for at least 50 years. The countries capable of creating them include the United States, Russia, Iraq, China, Israel, and Libya.

Several strains have been identified so far. See "*Mycoplasma*, many types" under **BACTERIA**. Also see "Amyotrophic Lateral Sclerosis (ALS)" and other entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**; "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue

Syndrome (CFS)" under **VIRUSES**; the many entries under **CHEMICAL SENSITIVITY / POISONING**; **FIBROMYALGIA**; and anything else that fits your symptom picture.

GUM PROBLEMS

See under **DENTAL**, *Mouth and Gums*.

—H—**H1N1**

See "Swine Flu / H1N1" under **VIRUSES**.

HAIR LOSS / ALOPECIA

Can be caused by a metabolic disorder (relating to spleen malfunction), hormonal imbalance, nutrient deficiency, stress, or even an immune malfunction (alopecia areata) in which the body's immune cells mistakenly attack hair follicles. The herb saw palmetto (also effective for male baldness) is sometimes used. A great treatment for everyone is externally applied castor oil (see Chapter 3, **Detoxification**).

If a fungal infection is involved, also see the *Malassezia* and other entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**. From Dr. Richard Loyd: 91366.5, 127228, 155646, 65636. Then try: 646, 10K, 3, 28, 95, 330, 2170, 2720, 4200, 5K, 30K, 40K.

Also try: 20, 146, 465, 787, 800, 880, 1552.

HAIRY CELL LEUKEMIA

1.2 + 250, 9.6, 160, 3K

Migraine

Pain at side of the head, often along the 5th cranial nerve. Can be accompanied by disordered vision, nausea, chill, and fatigue. May be caused by allergies, drugs, chemicals, unsuitable food, a toxified liver, menstrual problems, hormonal conditions, worry, or even strenuous exercise.

Migraines can also be caused by low blood sugar. The brain utilizes 25% of the body's glucose, so a blood sugar drop of as little as 5% can cause great fatigue and adversely affect thinking, mood, and motor coordination (among other brain functions). When blood glucose levels decrease, the body may compensate by increasing the blood volume to bring more glucose to the brain. This expands the blood vessels. Over time, the bulging blood vessels repeatedly pressing on nerves can cause pain. Some sources believe that migraines involve both constriction and dilation of blood vessels leading to the brain, which induces the release of inflammatory substances.

Avoid caffeine and other drugs, fake foods, overly fatty foods, and grains. Rest in a dark room. Alkaline, mineralized water may be helpful. Also see **BLOOD SUGAR PROBLEMS; PARASITES, PROTOZOA AND WORMS**, "General (unspecified)" and "*Strongyloides stercoralis* / Threadworm"; and applicable frequencies under **LIVER AND GALLBLADDER**. Finally, see "Teeth Grinding / TMJ

Problems / Jaw Pain" under **DENTAL, Teeth**, because migraine and headache problems can begin in the mouth.
10, 40, 160

HEALING AND REGENERATION

See various entries under **REGENERATION AND HEALING**.

HEARING CONDITIONS

See various entries under **EARS**.

WARNING! If You Have a Heart Condition or Are Wearing a Pacemaker

- ◆ **Electrode units are not safe.** Running electricity through the upper part of the body can cause harm or lead to death!
- ◆ **Radiant plasma units that don't use radio frequency (RF) are safe for people with heart conditions and for those who are wearing pacemakers.**
- ◆ **Radiant plasma units that use radio frequency (RF) are safe for people wearing pacemakers if the pacemakers are shielded.** Your pacemaker is very likely shielded, but ask your doctor anyway.
- ◆ **Radiant plasma units that use RF are safe for those wearing unshielded pacemakers if they are out of range of the RF.** Ask your rife machine manufacturer how far away you need to sit from the unit to be safely out of range of the RF. So far, RF plasma unit manufacturers have not reported any problems with pacemaker wearers, but it's better to be cautious than to automatically assume that your pacemaker is shielded or that the RF won't cause problems.

HEART, BLOOD AND CIRCULATION

The cardiovascular system consists of the heart, valves, and blood vessels. The heart is a pear-shaped organ in the chest between the lungs, leaning toward the left. Arteries carry blood away from the heart and pick up oxygen from the lungs. They become arterioles, and then tiny capillaries that carry the oxygen-rich, red blood to every cell in the body. At the point that the arterial capillaries pick up carbon dioxide from the cells, they are called venous capillaries, which then become the larger venules and then veins, which carry the now bluish-tinted blood back to the heart. The veins deposit the carbon dioxide into the lungs just before the venous blood returns to the heart to be recirculated through the body.

This very complex pump, consisting of four chambers, contains valves that regulate the blood as it flows in, through, and out. Although the heart is classified as an organ, it has also been considered an involuntary (although striated) muscle. But recently, neurocardiologists discovered that almost 65% of the heart cells are nerve cells that are identical to those in the brain, and which operate with the same

Nutritional Support for the Heart

- ◆ **Hawthorne Berry.** Well known among herbalists as vital for heart and circulatory system functioning. Its most powerful form is as a Gemmotherapy tincture (developed in the 1950s), made from plant embryonic tissues: buds, young shoots, and rootlets. ("Gemmo" is from the Latin *gemmae*, which means "buds.") These plant parts contain the most powerful energy, including growth hormones. The inexpensive, rapid-acting "plant stem cell therapy" tinctures detoxify, nourish, energize, and rejuvenate.
- ◆ **Omega 3 Fats.** Scarcity of Omega 3 fats in the diet (the best sources are from fish) cause the kidneys to secrete rennin. This causes the adrenals to secrete angiotensin, which in turn causes the blood vessels to constrict and raise blood pressure. Holistic practitioners see blood pressure normalize once the kidneys are supplied with enough Omega 3s.
- ◆ **Vitamin C.** Insufficient amounts of this vitamin can contribute to heart attacks.
- ◆ **Bioflavonoids, including Quercetin.** Bioflavonoid deficiencies lead to weakened blood vessel walls. (Note: the narrowing of arterial walls may be due to protein buildup. Proteins form on the walls to patch leaky blood vessels that are weak and threaten to hemorrhage.)
- ◆ **Magnesium.** Used in over 300 enzymatic processes in the body, it reduces blood pressure. Heart attack sufferers who are taken to a hospital are routinely given intravenous magnesium chloride. This mineral, scarce in the diets of half the US population, helps keep heart tissue healthy among other functions.
- ◆ **Coenzyme Q10.** A critical nutrient that's generally low or missing entirely in people with heart conditions. Levels are lowered even more by statin drugs. (People with congestive heart failure who are taking Coenzyme Q10 should not stop taking it suddenly, because abrupt withdrawal may temporarily aggravate the symptoms of congestive heart failure.)
- ◆ **B Vitamins.** The risk of heart attack can also be diminished by taking nutritional yeast (rich in B vitamins) and additional B12. B vitamins prevent the buildup of homocysteine in the blood by enhancing its conversion to (desirable) glutathione or methionine in the body. It's the buildup of homocysteine that triggers heart attacks, not cholesterol levels.
- ◆ **L-Carnitine.** An amino acid that breaks down fats and drives them into the tissues. Improves recovery time and exercise tolerance after heart attacks.

neurotransmitters. And molecular biologists have found that the heart is also an endocrine gland that releases the hormone ANF (atriol neuriatic factor) in response to our experience of the world. ANF affects the limbic (emotional) portion of the brain, which also deals with memory and learning and controls other hormone glands. In a feedback loop between the heart, the brain, and the rest of the body, our ideas, emotions, and impulses toward action are mediated by our heartfelt response to the environment. This is why, quite literally, our heart has an innate intelligence—and it may well be a more important "brain" than the stuff inside our skulls! In a true reflection of our emotional states, the heart literally expands with love or joy, and contracts in fear, sadness or anger. Thus, fulfillment in life is as crucial as diet to the heart's health.

Few people, and even practitioners, are aware of how important the microcirculation is. Varicose veins, clots, thrombosis, blood pressure issues, and more can be managed or reversed entirely with the BEMER®. It emits a pulsed magnetic field that opens up the tiny blood vessels and allows blood to flow as it should. See Appendix C.

Men are more at risk for heart attacks than women, and heart attack symptoms for each sex tend to be different. Men often experience stabbing chest pains, pain that radiates down the left arm, and cold sweat. Women may experience symptoms that could be from other causes: nausea and vomiting, heaviness in the abdomen, shortness of breath, chest pressure, and spasms up the spine to the neck, throat, and jaw. More women than men suffer strokes.

Cholesterol-rich foods are unjustly blamed for heart problems. Most (if not all) of the unwanted cholesterol that clogs the blood vessels *is produced by the body itself in response to chemical and microbial toxins*. Blood vessel walls become lined with cholesterol to protect them from becoming scratched or ulcerated. The body actually needs cholesterol, found in various foods including eggs and liver.

Insufficient thyroid hormone is a significant contributing factor to coronary disease. In 1950, Dr. Broda Barnes began a long-term, two-year investigation to see if proper treatment of hypothyroidism would prevent heart attacks. His subjects were matched against those in another, famous survey called the Framingham Study. According to the Framingham statistics, 72 people in Barnes's group should have suffered heart attacks, but only four people were stricken. The single difference between Barnes's subjects and those in the Framingham Study was Barnes's use of thyroid hormones. (They were given whole dessicated thyroid gland, not the synthetic drug.) Over 90% of Framingham-Study-predicted heart attacks were prevented. Dr. Barnes warned that the incidence of heart attacks would continue unless hypothyroidism was recognized and properly treated. Therefore, see "Thyroid, Underactive / Hypothyroidism" under **GLANDS, Thyroid**.

Under a microscope, Guenther Enderlein found the fungus *Mucor racemosus* fresen present in the blood of virtually every case of coronary and circulatory conditions. The frequencies

are listed in this section. Also see the various “*Chlamydia*” frequencies under **BACTERIA**, as researchers are finding that this microorganism is also causing plaque buildup.

Anemia, related to low oxygen

Stop! See warning (box) at the beginning of this section.

Anemia is characterized by abnormally low levels of red blood cells or hemoglobin, the substance in red blood cells that attract and carry oxygen to the rest of the body. Without sufficient oxygen transport, all organs, glands, and bodily systems are affected. Just a few symptoms are fatigue, weakness, brittle nails, cardiovascular difficulties, and shortness of breath.

The three main causes of anemia are loss of blood (through pregnancy, heavy menstrual periods, ulcers or injuries); insufficient red blood cell production (due to insufficient iron, folate, and/or Vitamin B12 in the diet); and the rapid destruction of red blood cells (sometimes occurring in cases of cancer). Anemia may also occur during infection, when the bone marrow temporarily slows its production of red blood cells.

The first priority is to make sure that the diet contains all necessary nutrients. Some form of oxygen therapy may be helpful. There are no frequencies for anemia *per se*. But some pathogens directly affect the red blood cells and anemia may result; so see “*Funneliformis mosseae*” under **CANDIDA, FUNGI, MOLDS AND YEASTS**. Also see applicable entries in this section.

Anemia, Sickle Cell

Stop! See warning (box) at the beginning of this section.

Healthy red blood cells are round, a shape that allows them to move easily through the bloodstream to carry oxygen to all the tissues. In people with sickle cell anemia, the red blood cells are abnormal. Shaped like stiff, pointy sickles (or crescent moons), they get stuck when traveling through small blood vessels, which causes severe pain. Organ damage can also occur because tissues aren't getting enough oxygen. These rigid and sticky blood cells die prematurely—after 10 to 20 days, compared to about 120 days for a normal red blood cell—which results in a chronic shortage of red blood cells leading to a condition called anemia (above).

Symptoms include breathing difficulties, chest pain, coughing, fatigue, fever, headache, dizziness, increased susceptibility to infection, jaundice, and rapid pulse. Often the spleen will become enlarged, causing abdominal pain because it has trapped the abnormal red blood cells. If enough of the crescent cells block blood vessels to the head, the person may have a stroke.

In the US, mostly African-Americans are affected. Other forms of sickle cell sometimes occur in those of Mediterranean, East Indian, or Middle Eastern descent.

According to conventional medicine, this is a genetic disease with no cure. The most common treatments

Medical resources routinely used for intravenous hydration . . . may be limited in remote regions of the world. When faced with these shortages, physicians have had to improvise . . . We report the successful use of coconut water as a short-term intravenous hydration fluid [in the] Solomon Islands.

—Darilyn Campbell-Falck et al.,
“The intravenous use of coconut water,”
The American Journal of Emergency Medicine, January 2000

include pharmaceutical pain relievers, medications to prevent the problems associated with anemia, daily doses of antibiotics to prevent infection, regular blood transfusions, and sometimes bone marrow transplants.

Holistic medicine holds more promise for a genuine cure. Because a crescent red blood cell is an irritant, it very likely provokes an inflammatory response, which suggests an autoimmune component. This offers clues on how to treat the condition. Zinc, a mineral that's deficient in a majority of children with sickle cell, reduces the severe abdominal pain and vomiting characteristic of sickle cell anemia. Methylfolate (see Chapter 3, **Nutritional Supplements**) helps the system produce new red blood cells. Vitamin E, along with essential fatty acids (EFAs), shows great promise in assisting the bone marrow's production of red blood cells. This not only alleviates symptoms, but it also normalizes cells. Hydration is important; no coffee, alcohol, tea, or soda. Drinking filtered mineralized water can help manage the pain.

The Crescent Alliance Self Help for Sickle Cell is an organization that has researched the use of certain herbs that not only lessen symptoms, but also normalize cells by causing them to revert to their proper shape. These plant extracts include *Nigritian kief* (a certain species of hemp), *Fagara zanthoxyloides* root (also used for malaria), a boiled extract of edible *Cajanus* (cajan) beans, *Cannabis*, and prickly ash bark. Some sufferers are also obtaining good results with ozone (see Chapter 3). If the cells are oxygenated properly, they have less chance to mutate.

Avoid emotional stress, cold temperatures, and strenuous exercise. Keep the body well oxygenated by avoiding high altitudes, cigarette smoke and dirty air. Also see **AUTOIMMUNE DISORDERS**.

Blood Clot

Stop! See warning (box) at the beginning of this section.
Clots are coagulated, partly solidified blood containing fibrous proteins—what some clinicians call the rouleau effect, French for “stacked coins,” because that’s what the red blood cells look like. Clumped together in this way, red blood cells lack sufficient oxygen and have an abnormally low electrical charge.

Never apply electrodes to an area that might have clots. The current from electrodes, which mechanically squeezes the tissues, can dislodge the clot and send it to your brain, possibly causing a stroke or even killing you. Radiant plasma units are safe because they deliver frequencies via an electromagnetic field without any mechanical pressure.

Three enzymes are often used to prevent and disperse blood clots, thin the blood, and provide anti-inflammatory effects: lumbrokinase (from earthworms), nattokinase (from fermented soy), and serrapeptase (from silkworms). Take them on an empty stomach (at least 2 hours after eating or 1–2 hours before), to ensure that they reach the bloodstream instead of being used up in the process of digestion.

696

Hemophilia

Stop! See warning (box) at the beginning of this section.
A hereditary bleeding disorder in which the blood does not readily clot. Some of the numbers are from Dr. Garvey.
542, 603, 652, 751, 778, 845, 942

Hemorrhage

Stop! See warning (box) at the beginning of this section.
Abnormal discharge of blood from a vessel, internal or external. Go to emergency room.
802 + 1550

Infections, Post-operative (for valve and shunt implants)

Stop! See warning (box) at the beginning of this section.
See **BACTERIA**, “*Propionibacterium acnes*”; this microbe is implicated in post-surgical infections of heart valves and nervous system shunts.

Intermittent Claudication

Stop! See warning (box) at the beginning of this section.
Arterial spasm causing limping and leg cramps.
45, 48, 10K, 40K

Leukemia, all kinds

See “Leukemia” entries under **CANCER**.

Leukosis

Stop! See warning (box) at the beginning of this section.
Increase of leukocytes (white blood cells), or of the tissue that forms them. It may be a precursor to leukemia, so see “Leukemia” entries under **CANCER**. Parasites may be involved, so see applicable entries under **PARASITES, PROTOZOA AND WORMS**. Use all the frequencies below.
612, 633, 644, 653, 3722

Limping caused by Intermittent Claudication

Stop! See warning (box) at the beginning of this section.
An arterial spasm that causes leg cramps or lameness.
45, 48, 10K, 40K

Mucor racemosus fresen

Stop! See warning (box) at the beginning of this section.
A fungus that grows on decaying vegetation and bread and can cause ear infections. According to Dr. Guenther Enderlein, it’s implicated in most (if not all) coronary conditions.

First try: 310, 474, 875

Also try: 473, 686, 713, 729, 731, 751, 760, 778, 871, 873, 876, 878, 887, 1200, 7768, 7976, 8788

Use the BEMER® to increase all circulation.

See Appendix C for details.

Pericarditis

Stop! See warning (box) at the beginning of this section.
 Infectious inflammation of the pericardium, the membrane sac enclosing the heart and the major blood vessels.

1.1 + 73, 3.9, 20, 72, 80, 95, 125, 160, 444 + 1865, 465, 600 + 625 + 650, 660 + 690 + 727, 760, 787, 802 + 1550, 880, 1600, 2170, 2720, 40K

Phlebitis

Stop! See warning (box) at the beginning of this section.
 Vein inflammation.

776, 1500

Plasmacytoma

See "Multiple Myeloma" under **CANCER**.

Raynaud's Disease

Stop! See warning (box) at the beginning of this section.
 Nervous system disorder leading to circulation problems in the limbs. It can lead to congestion and swelling, and if severe enough, gangrene.

20, 660 + 690 + 727

Red Blood Cell Production, to Increase

Stop! See warning (box) at the beginning of this section.
 1524

Rheumatic Fever

Stop! See warning (box) at the beginning of this section.
 Fever, sweating, painful and swollen joints. Inflammation frequently spreads to heart.

333 + 523 + 768 + 786, 376, 952

Stroke

Stop! See warning (box) at the beginning of this section.
 Hemorrhage, or abnormal discharge of blood due to a burst blood vessel, into the brain or spinal cord. This can cause speech disturbances, slow pulse, labored breathing, incontinence, unconsciousness, and death. See a doctor.

Immediately 3 + 230; then 6.3 + 148, 20, 72, 95, 125, 428, 444 + 1865, 522, 590, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 832, 880, 1600, 1800, 2170, 2720, 10K 40K

Stroke Paralysis / Apoplexy

Stop! See warning (box) at the beginning of this section.
 Sudden lessening or loss of consciousness with paralysis, due to a stroke. To care for someone who has just had a stroke, keep the environment quiet and comfortable,

move the person frequently to avoid bedsores, and keep him or her warm if pulse is weak and temperature is low. See a doctor.

3 + 230, 20, 40, 72, 95, 125, 146, 152, 293, 330, 333 + 523 + 768 + 786, 428, 442, 444 + 1865, 522, 555, 600 + 625 + 650, 622, 660 + 690 + 727, 751, 787, 797, 800, 880, 1146, 1800, 2720, 8176, 10K, 40K

Tachycardia

Stop! See warning (box) at the beginning of this section.
 Abnormal rapid heart action.

1.2 + 250

Thrombocytopenic Purpura / Werlhof's Disease

Stop! See warning (box) at the beginning of this section.
 Abnormal discharge of blood from the mucous membranes into the surrounding tissues, causing purplish blotches in the skin and accompanied by reduction of blood platelets (clear blood cells) and enlargement of spleen.

452, 660 + 690 + 727

Thrombophlebitis / Thrombosis, Infective

Stop! See warning (box) at the beginning of this section.
 The formation of a blood clot. Do not use electrodes. If the clot that causes the vein inflammation is dislodged, it can cause a heart attack (death of an area of the heart due to an interrupted blood supply), a stroke (a temporary reduction of blood and oxygen in the brain due to blood vessel blockage), a hemorrhage (abnormal discharge of blood from a blood vessel into surrounding tissue or outside of the body), or an embolism (the obstruction of a major blood vessel by a blood clot or clump of other material).

20, 72, 95, 125, 444 + 1865, 660 + 690 + 727, 685, 776, 787, 802 + 1550, 880, 1489, 1500, 1800, 2170, 2720, 2489

Ulcer, Ventricular

Stop! See warning (box) at the beginning of this section.
 Open wound in one of the chambers of the heart.

142, 232, 566, 676, 769, 770, 10K

Varicose Veins

Stop! See warning (box) at the beginning of this section.
 Distended and swollen veins, sometimes bulging on the surface of the skin.

1.2 + 250, 28

Vein Inflammation

See "Phlebitis" in this section.

End of Heart, Blood and Circulation section.

Always use 40K for tissue regeneration.

HEARTBURN

See under **GASTROINTESTINAL TRACT**, *Stomach and Esophagus*.

HEARTWORM

See “*Dirofilaria immitis* / *Dirofilariasis* / Heartworm” under **PARASITES, PROTOZOA AND WORMS**.

HEAVY METALS, DETOXIFYING FROM

See “Mercury, Aluminum, and Other Contaminants” under **CHEMICAL SENSITIVITY / POISONING**.

HEEL PAIN

See under **INJURIES**.

HELICOBACTER PYLORI

See under **GASTROINTESTINAL TRACT**, *Stomach and Esophagus* or **BACTERIA**.

HEMOCHROMATOSIS

Known as “iron overload” or “iron storage disease,” due to abnormal iron metabolism that permits absorption of too much iron from an ordinary diet. This condition is usually hereditary but can also be acquired. Symptoms include chronic fatigue (most common); cirrhosis or cancer of the liver; arthritis and joint pain; impotence, sterility or infertility; menstruation irregularities or problems; hair loss; diabetes; cancer (cancer thrives on iron); abdominal pain or swelling; weight loss; frequent infections; immune dysfunction; headaches; hypothyroidism; heart problems; and even death. This range of symptoms is due to the ability of excess iron to injure virtually all body organs and systems.

This condition is *not* considered a blood disorder per se, although some of its effects appear in the blood. It can be managed by early detection and the adequate mechanical removal of iron, done by a doctor. People can have an iron overload and be asymptomatic, or be anemic and still have this disorder; so get the proper testing.

Rife researcher James Bare reports that abnormal red blood cells that have formed in people with hemochromatosis respond to 5K, with a “significant drop” if the sessions run for at least an hour at a time. The abnormally large spleen that can accompany this condition has even been reported to reduce significantly in size. We do not know if this same effect happens in people with normal red blood cells.

5K

Also try: 40K (for as long as desired)

HEMOPHILIA

See under **HEART, BLOOD AND CIRCULATION**.

HEMORRHAGE

See under **HEART, BLOOD AND CIRCULATION**.

HEMORRHAGIC FEVER

See “Immune Function, to Normalize / Support” under **REGENERATION AND HEALING**.

IMPOTENCE AND FRIGIDITY, MANY TYPES

See “Sexual Function” under **MEN** or **WOMEN**.

INCLUSION BODY MYOSITIS (IBM)

Progressive, inflammatory disease of muscle weakness and degeneration. Similar to polymyositis, the weakness occurs gradually (over months or years). Symptoms may begin with falling and tripping, or difficulty using the hands to grip and pinch, making tasks like buttoning clothing difficult. All muscles in the body are susceptible to shrinking. Difficulty swallowing occurs in about half of those with IBM, which can culminate in choking. IBM affects men more frequently than it does women, and symptoms usually begin after age 50. Allopathic doctors currently have no treatment, only physical therapy to help maintain mobility.

It's not clear which comes first: inflammation; the continual, stressful presence of antigens (molecules that stimulate an exaggerated immune response causing muscle fiber damage); or the accumulation of abnormally-folded proteins called ubiquitin. Ubiquitin, which is not present in other muscle illnesses, causes muscle fibers to degenerate in cases of IBM.

Some researchers believe that IBM may be caused by a retrovirus (see Chapter 1, **The Vaccine Controversy**). Sauna and ozone therapies could help. Also see **AUTOIMMUNE DISORDERS**; **VIRUSES**, “Retrovirus, variants”; applicable entries under **MUSCLES**; the many entries under **CHEMICAL SENSITIVITY / POISONING**; **BACTERIA**, “*Mycoplasma*, many types” (as *Mycoplasma* can cause autoimmune conditions); and **REGENERATION AND HEALING** (make sure to use 40K).
From Dr. John Garvey: 122, 1124, 1169

INCONTINENCE

See under **URINARY TRACT**, *Bladder and Urethra*.

INDIGESTION / DYSPEPSIA

See under **GASTROINTESTINAL TRACT**, *Systemic Conditions*.

INFANTILE PARALYSIS

See “Polio / Poliomyelitis” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

INFECTIONS, NON-SPECIFIC

Look up precise symptom picture(s) and/or microorganisms under **BACTERIA**; **CANDIDA, FUNGI, MOLDS AND YEASTS**; **PARASITES, PROTOZOA AND WORMS**; or **VIRUSES**. If you can't guess what pathogen is infecting you, go to the section that highlights the *body part* that's affected (respiratory tract, gastrointestinal tract, etc.).

You can also try the frequencies below for commonly occurring pathogens, but don't be discouraged if they don't help you. It simply means that you haven't targeted the correct pathogen (yet).

First try: 1.2 + 250, 20, 48, 72, 95, 125, 304, 422, 444 + 1865, 464, 660 + 690 + 727, 676, 766, 333 + 523 + 768 + 786, 802 + 1550, 880, 5500, 40K (for as long as desired)

Then try: 428, 440, 600 + 625 + 650, 700, 760, 776, 787, 832, 1500, 1600, 2112, 2170, 5K

And then try: 450, 500, 610 + 692 + 980, 732, 751, 1800, 1850, 2008, 2720, 2489, 3040, 4K

INFECTIOUS MONONUCLEOSIS

See “Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)” under **VIRUSES**.

INFECTIVE THROMBOSIS

See “Thrombophlebitis / Thrombosis, Infective” under **HEART, BLOOD AND CIRCULATION**.

INFERTILITY

See “Sexual Function” under **MEN** or **WOMEN**.

INFLAMMATION

Inflammation (a huge category) is the body's way of dealing with irritation, whether caused by chemicals, friction, heat, pathogens, or toxins. An area becomes inflamed due to the many types of scavenger cells, which have traveled to the site to ingest dead and damaged tissue and act as a cushion or barrier between the injured tissue and surrounding areas. Inflammation also results from increased blood flow, which occurs to bring nutrients, oxygen and hormones to the repair site. Inflammation is different from infection, although one may arise from the other. Local infection often causes swelling, which contains the infection and protects the surrounding tissues from being invaded by escapee pathogens. On the other hand, when non-pathogenic swelling occurs (as in an injury), and if the scavenger cells cannot break down and digest the damaged tissue quickly enough, the injured cells putrefy, resulting in an infection due to pathogens, endogenous toxins, or both. Typically, the body's initial inflammatory response is hypervigilant: the swelling causes the circulation in the area to slow down, which prevents healing. This is why cold first, and later cold alternating with heat, is used to eliminate the swelling. Cold contracts the tissues, which squeezes waste out of the affected area. Heat expands the tissues. Alternately using cold and heat causes a pumping motion, which gets the dense lymph tissue moving. This allows wastes to be processed and escorted out of the body.

Eliminate sugars from the diet, even those naturally occurring in fruits. Sugar causes inflammation, and impedes the ability of nerves to carry the correct signals. Avoid foods in the nightshade category: white and yellow potatoes, tomatoes, bell and hot peppers, and eggplant, which (like their relative, tobacco) contain poisonous alkaloids that cause swelling of the joints and tissues. Omega 3 fish oils help correct inflammation and repair all types of tissues, including nerves and blood vessel linings.

Curcumin, a component of turmeric root (used in Indian cooking) significantly reduces the effects of inflammatory cytokines in human fat tissue. Other anti-inflammatory agents are ginger root and the herb *Boswellia serrata*. White

blood cells require enzymes to break down the waste products of inflammation (and infection), so proteolytic (protein-digesting) enzymes such as protease and bromelain can also help. CBD from *Cannabis* offers great relief as well.

Of the frequencies for many types of inflammation, note that 6.3 and 3.6 are also used for irritability and whining. For muscle- and tendon-related inflammation, see **MUSCLES**. For nerve-related inflammation, see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**. Also see **INJURIES** and **REGENERATION AND HEALING**.

1.3, 10.5, 3.6, 6.3 + 148, and 2489 and 2720 for pain

INFLAMMATORY BOWEL DISEASE (IBD)

See “Crohn’s Disease / Inflammatory Bowel Disease (IBD)” under **GASTROINTESTINAL TRACT, Colon / Large Intestine**.

INFLUENZA VIRUSES, MANY

See under **VIRUSES**.

INJECTIONS AND INOCULATIONS, TO DETOXYFY FROM

See “Vaccinations, Reactions to” under **CHEMICAL SENSITIVITY / POISONING**.

INJURIES

For muscle, ligament, and other soft tissue tears, pad units are usually more effective than plasma. Place electrodes on either side, or at the front and back, of the inflammation site.

Both cold and heat are used. Cold packs work best within 72 hours of an injury. They constrict blood vessels, preventing an unhealthy accumulation of blood and lymph at the injury site. Leave the cold pack on until you cycle through “C-BAN”: Cold, Burning, Aching, and eventually Numbing. This should take about 15 or 20 minutes. Then remove the cold pack for 15–30 minutes. After two or three rounds, the swelling should decrease. After the swelling has subsided, use heat. Heat brings blood (and thus oxygen and nutrients) to the area.

Also see entries under **MUSCLES; BONE AND SKELETON; BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**; and especially **INFLAMMATION**, for tips on additional protocols.

Always use 2720 (a good overall frequency for pain), 10K and especially 40K (for tissue restoration), and frequencies for your specific symptoms.

Backache, including Spasms

A spasm is a movement due to a sudden involuntary muscular contraction. It can be quite painful. Many microbes can be involved, particularly *Staphylococcus*. Please note that these frequencies are not a substitute for a chiropractic adjustment if the skeletal alignment is off or the spinal cord is torqued or twisted. Muscle spasms often indicate a magnesium deficiency. Also see entries under **URINARY TRACT, Kidneys**, as pain in the lower back can sometimes indicate kidney inflammation or infection. From Dr. Richard Loyd (for neck pain too, and in this order): 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 130.81, 146.83, 164.81, 174.61, 196, 220.2,

246.94, 138.57, 155.56, 185, 207.65, 233.08, 138.57, 155.56, 185, 207.65, 233.08, 4.9, 6, 9.19

Then try: 519.34 for 20 minutes

Then try: 677 (for 20 minutes), 760 (for 10 minutes), and sweep 326–328

And then try: 26 (for 15 minutes), 33, 41.2, 120, 146, 160, 212, 240, 305 (for 6 minutes), 326, 333 + 523 + 768 + 786, 424, 464, 465, 466, 522, 528, 555, 660 + 690 + 727, 760, 784, 787, 789, 800, 802 + 1550, 880, 1552, 2112, 2720 (for as long as needed), 3K, 5K, 10K, 40K

Bruise / Contusion

Pain, swelling and discoloration of skin, without any cuts or breaks in the skin.

9.1, 110, 2720, 10K, 40K

Bursitis

Inflammation of connective tissue, mainly around joints. This condition may be caused by a great many pathogens. Also experiment with the arthritis, tendomyopathy, and sprain frequencies. White blood cells require enzymes to break down the waste products of inflammation (as well as infection), so taking proteolytic (protein-digesting) enzymes such as protease and bromelain may help.

660 + 690 + 727, 787, 880, 10K, 40K

Carpal Tunnel Syndrome / Repetitive Stress Injury (RSI)

Inflammation of the forearm, wrist and fingers, due to repetitive motion that places excessive stress on the tendons, ligaments, and musculature. Some research indicates that 15 Hz helps escort calcium into the cells.

6.3 + 148, 15, 20.5, 146, 444 + 1865, 465, 522, 600 + 625 + 650, 660 + 690 + 727, 685, 700, 737, 760, 776, 787, 802 + 1550, 832, 880, 1K, 1500, 2008, 10K, 40K

Chilblains

Inflammation and swelling of the feet, toes, or fingers due to blood vessel injury during prolonged exposure to cold. Symptoms may also include skin lesions. Also see “Frostbite” in this section.

20, 232, 622, 822, 2112, 4211, 5K, 10K, 40K

Disc, Slipped / Spine, Misaligned

Misaligned vertebra of the spine that pinches a nerve, causing pain and interfering with the posture and function of the body. Some researchers believe that slipped discs are a result of spasms from microbial toxins. You may still need a chiropractic adjustment to align the disc.

20, 26, 57, 72, 95, 125, 146, 333 + 523 + 768 + 786, 555, 787, 660 + 690 + 727, 880

Elbow pain / Epicondylalgia

1.2 + 250, 26, 160, 2720, 3K, 10K, 40K

Fibromyalgia

See **FIBROMYALGIA**.

Frostbite

Freezing of body extremities (fingers, toes, earlobes and nose), which injures the blood vessels. Symptoms include tingling, redness and pain, followed by paleness and numbing. Warm the core of the body first (and administer hot drinks), and gradually warm the extremities. Even people with blackened limbs (which usually are amputated) sometimes recover. Also see “Chilblains” in this section.
660 + 690 + 727, 787, 880

Frozen Shoulder

See “Shoulder, Frozen” in this section.

Head Injuries

For a head injury, get medical help immediately because there might be swelling of the brain, which can persist years after the initial event.
4.9, 5.8, 9.6, 72, 160, 522, 660 + 690 + 727, 787, 880, 3K, 40K

Headaches caused by Vertebral Misalignment

For other types of headaches, see headaches. This is not meant to replace an adjustment by a chiropractor.
1.2 + 250, 9.6, 160, 3K

Heel Pain / Plantar Fascitis

Inflammation of the fascia, or elastic connective tissue that envelops muscle, at the bottom of the foot. Can be caused by stressing the feet via excess jogging, walking or climbing, or by wearing shoes with no arch support or cushioning. Ice the feet. Place a foot on top of a golf ball and roll on it to break up adhesions (it works very well); or try gentle foot massage. This has no known frequencies.

Knee Pain

See a chiropractor to rule out subluxation or other structural causes. Use a pad unit.
1.2 + 250, 3 + 230, 7.69, 7.7, 9.39, 9.4, 9.6, 20, 28, 73, 160, 660 + 690 + 727, 787, 802 + 1550, 880, 2720, 3K, 40K

Ligament Sprain

Ligaments are connective tissue made up of long, stringy collagen fibers, which connect the ends of bones together to form a joint. When torn, they cause pain and swelling. Below are frequencies for pain due to injury, stiff neck, and some arthritis frequencies. Also see “Tendomyopathy” and other entries under **MUSCLES**.
0.5, 1, 1.1 + 73, 1.2 + 250, 4.9, 5.8, 9.19, 9.2, 9.4, 9.7, 10, 20, 20.5, 35, 40, 50, 80, 120, 125, 320, 2720, 10K
To further stimulate healing: 40K (as long as desired)

Lumbago

Muscular ache across loins due to either too rapid cooling of overheated region, or unnatural twisting.

Supplemental Therapies for Injuries to reduce swelling and pain and speed healing

Electromedicine

- ◆ **Magnetex[®], Avazzia[™], Tennant Biomodulator[®], BEMER[®], Wave Therapy, LEDs.** See Appendix C.
- ◆ **Tuning Element[™] Relief Patches.** See Appendix C.
- ◆ **Spectro-Chrome Color Therapy.** Inexpensive and low-tech. See Chapter 3.

Homeopathy

- ◆ **Arnica, Hypericum, Ruta Grava.** 9C, 12C, or 30C dose.
- ◆ **Rescue Remedy[®], T-Relief[®], above remedies together.** Combination formulas available as liquid, pellets, or in ointment/cream form. Apply creams externally.

Analgesic Creams / Gels / Sprays

- ◆ **Tiger Balm[®] and similar preparations** containing menthol, wintergreen, natural camphor, clove, mint, cassia, and other herbs.

Enzymes (oral supplements and creams)

- ◆ **Protease. Bromelain. Papain. Lumbrokinase. Nattokinase. Serrapeptase.** Take orally on an empty stomach so they scavenge protein debris in blood instead of digesting food. Apply creams topically.

Neck Pain

15, 17, 326

From Dr. Richard Loyd (for back pain as well, and in this order): 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 138.57, 155.56, 185, 207.65, 233.08, 138.57, 155.56, 185, 207.65, 233.08, 4.9, 6, 9.19

Neck, Stiff, including Spasticity

Pain and stiffness along with involuntary sudden movement or convulsive muscular contraction.
4.9, 6, 9.19, 9.2

Pain due to Injury

0.5, 1, 1.1 + 73, 1.2 + 250, 10.5, 20.5, 5.8, 10, 20, 35, 40, 80, 125, 160, 320, 240, 2720 (for at least 20 minutes, preferably longer, even up to one hour), 6K, 10K, 40K

Plantar Fascitis

See “Heel Pain / Plantar Fascitis” in this section.

Repetitive Stress Injury (RSI)

See “Carpal Tunnel Syndrome / Repetitive Stress Injury (RSI)” in this section.

Shoulder, Frozen

Painful shoulder area, often worse at night, that severely limits mobility and primarily affects the tendons or connective tissue near joints.

660 + 690 + 727, 776, 787, 802 + 1550, 880, 10K, 40K (for as long as desired)

Slipped Disc

See “Disc, Slipped / Spine, Misaligned” in this section.

Sprain

Partial rupture or twisting of a joint, its tendon and ligament attachments, and perhaps the muscle as well. The tissue fibers are torn, causing pain and swelling. I have not seen any listings for sprains per se, but the ones below may apply: frequencies for stiff neck, some arthritis frequencies, and especially pain due to injury. Also see “Tendomyopathy” and other entries under **MUSCLES**.

0.5, 1, 1.1 + 73, 1.2 + 250, 20.5, 4.9, 5.8, 9.19, 9.2, 9.4, 10, 20, 35, 40, 80, 125, 320, 2720, 10K, 40K (for as long as desired)

Subluxation / Spine Distortion

Twisting of muscles and spine. Dislocation of bones or organs, which can pinch nerves and cause pain. This is not a substitute for a chiropractic adjustment.

9.1, 9.6, 66, 110

Tendomyopathy

Infirm condition of both the muscles and tendons, causing inflammation and pain. Also see “Tendon Tear” in this section.

0.5, 1, 1.1 + 73, 1.2 + 250, 10.5, 20.5, 4.9, 5.8, 9.2, 9.4, 10, 20, 26, 40, 80, 146, 160, 320, 465, 522, 2720, 3K, 40K (for as long as desired)

Tendon Tear

Partial rupture or twisting of a joint and its tendon attachments, long connective tissue fibers that attach muscles to bones. Sometimes the ligaments—short bands of fibrous connective tissue that connect bone to bone—are involved as well. The tissue fibers are torn, which causes pain and swelling. I have not seen any listings for sprains, so below are frequencies for pain due to injury, stiff neck, and some arthritis frequencies. Also see “Tendomyopathy” in this section and the many entries under **MUSCLES**.

0.5, 1, 1.1 + 73, 1.2 + 250, 4.9, 5.8, 9.19, 9.2, 9.4, 10, 20, 20.5, 35, 40, 80, 120, 125, 320, 2720, 10K

Tennis Elbow

An unscientific term for a common injury acquired in tennis players, due to repetitive motion.

8, 734

Whiplash

See “Head Injuries” and other entries in this section. Whiplash is serious because it can cause the brain to swell—and the swelling can persist for decades and cause multiple problems, many of them serious. See a qualified health practitioner!

20, 2720, 10K, 40K

End of Injuries section.

INOCINE PRODUCTION, TO STIMULATE AND NORMALIZE

See under **REGENERATION AND HEALING**.

INSECT BITES

Insect bites are more than simply painful. In some cases, they can cause serious damage or even death. To prevent the venom from spreading and stop the pain and itching, some people use microcurrent—generated by a zapper, Avazzia™, Tennant Biomodulator®, or similar device (see Appendix C). Current neutralizes toxins from insects and poisonous snakes by denaturing the proteins in the venom. To draw out the poisons, make a poultice of raw mashed white onion, bentonite or green clay, or activated charcoal, adding optional colloidal silver or tea tree oil. Also apply iodine or hydrogen peroxide at the site of the bite to prevent infection. Papain (papaya enzyme) breaks down the proteins of spider venom. In some parts of the world, fermented papaya cream is available, made solely of papaya fruit and a preservative. To help with healing afterwards, use essential oil of lavender. In serious cases, see a doctor! Also see **SNAKEBITES**.

Insect Bites, General

660 + 690 + 727, 880

Black Widow Spider Bite

The Black Widow is considered the most venomous spider in North America. Bites are uncommon. The spiders are most likely to bite when guarding their eggs. The severity of reaction depends on the area of the body bitten, the amount of venom injected, and depth of the bite. Sometimes the bite is not even felt. Initially there may be only slight swelling and two faint red spots in the area of the bite. More serious symptoms include intense abdominal, back and foot pain; swollen eyelids; cramps; nausea and vomiting; sweating; tremors; labored breathing and speech; and unconsciousness, convulsions and death if the person does not receive immediate medical attention. If you have a heart condition and have been bitten, see a doctor.

376, 660 + 690 + 727

Brown Recluse Spider Bite

Refers to the species *Loxosceles reclusa*, found mainly in the southern and midwestern portions of the United States. Causes stinging, intense pain, and usually a

small white blister that becomes larger and gangrenous; accompanied by fever, chills, nausea, weakness and joint pain within two days. The spider burrows into unused clothing, clutter, and corners of furniture, biting only if disturbed. Fatalities are rare, but bites are dangerous to children, the elderly, and those with compromised immune function. The venom from the bite can cause scarring, and the ulcerating sore may take up to eight weeks to heal. Some people don't feel the bite, and are aware of being bitten only later when they see dead tissue and there's an infection.

Yellow Fly Bite

Causes pain, itching, and sometimes severe allergic reactions. In the southeastern United States (mostly Florida), about a dozen different yellow-bodied biting flies—including deer flies and horse flies—in the family *Tabanidae* are called “yellow flies,” although entomologists (insect scientists) regard only one species, *Diachlorus ferrugatus*, as yellow fly. These flies feed on humans and wild and domestic animals. They're prevalent from March through November, peaking in numbers from May through June. They are most active during the early morning, late afternoon and early evening, in shady forests.

Cats Give Themselves Rife Sessions

Why do cats purr? . . . [They purr when they're] . . . content. . . frightened, severely injured, giving birth and even while dying. For the purr to exist in different cat species over time, geographical isolation, etc., there would likely have to be something very important (survival mechanism) about the purr. There also would have to be a very good reason for energy expenditure (in this case creation of the purr) when one is physically stressed or ill. The vibration of the cat's diaphragm, which with the larynx, creates the purr, requires energy. If an animal is injured they would not use this energy unless it was beneficial to their survival. . . .

Most people have heard of a cat's "nine lives." There is also an old veterinary adage still repeated in veterinary schools which states, "If you put a cat and a bunch of broken bones in the same room, the bones will heal." Any veterinary orthopedic surgeon will tell you how relatively easy it is to mend broken cat bones compared with dog bones, which take much more effort to fix, and take longer to heal. There is excellent documentation of the cats' quick recovery from . . . [falling from] high-rise [buildings]. . . . [Researchers] documented 132 cases of cats plummeting many stories from high rise apartments (average 5.5 stories), some suffering severe injuries. . . . 90% of these cats survived. . . . There is another clue found in a study performed by Dr. T.F. Cook (1973), "The Relief of Dyspnoea in Cats by Purring," in the *New Zealand Veterinary Journal*. A dying cat who could not breathe (they were considering euthanasia) was found to breathe normally once it began purring. The purring opened up the cat's airway, and improvement was "remarkable and the next day [the cat] commenced to eat. . . ." Three species of cats have a strong harmonic at exactly 100 Hz, the vibrational frequency found to relieve dyspnea; one species [is] within 2 Hz and one species within 7 Hz of 100 Hz. It could be that the cat's purr decreases the breathlessness by vibratory stimulation.

Fauna Communications has recorded many cats' purrs at a non-profit facility and the Cincinnati Zoo, including the cheetah, puma, serval, ocelot and the domestic house cat. After analysis of the data, we discovered that:

- ◆ The dominant and fundamental frequency for three species of cats' purrs is exactly 25 Hz or 50 Hz, the best frequencies for bone growth and fracture healing. All of the cats' purrs all fall well within the 20–50 Hz . . . range, and extend up to 140 Hz. All the cats except the cheetah have a dominant or strong harmonic at 50 Hz.
- ◆ The harmonics of three cat species fall exactly on or within two points of 120 Hz which has been found to repair tendons. One species [is] within 3 Hz and one within 7 Hz.

- ◆ Eighteen to thirty-five Hz is used in therapeutic biomechanical stimulation for joint mobility. Considering the small size of many of these cats, especially the domestic cats, it is interesting to note that all of the individual cats have dominant frequencies within this range. In fact, some of the cats have two to three harmonics in this range.
- ◆ The frequencies for therapeutic pain relief are from 50–150 Hz. All of the individual cats have at least five sets of strong harmonics in this range.
- ◆ Therapeutic frequencies for the generation of muscle strength [are from] 2–100 Hz. All of the individual cats have at least four sets of strong harmonics in this range.
- ◆ Therapy for COPD [Chronic Obstructive Pulmonary Disease] uses 100 Hz; all of the individual cats have a dominant frequency of exactly 100 Hz.

Is it possible that evolution has provided the felines of this world with a natural healing mechanism for bones and other organs? Researchers at Fauna Communications believe so.

Being able to produce frequencies that have been proven to improve healing time, strength and mobility could explain the purr's natural selection. In the wild when food is plentiful, the felids are relatively sedentary. They will spend a large portion of the day and night lounging in trees or on the ground. Consistent exercise is one of the greatest contributors to bone, muscle, tendon and ligament strength. If a cat's exercise is sporadic, it would be advantageous for them to stimulate bone growth while at rest. . . . Therefore, having an internal vibrational therapeutic system to stimulate healing would be advantageous, and would also reduce edema and provide a measure of pain relief during the healing process.

In summary: vibrations between 20 Hz and 40 Hz are therapeutic for bone growth/fracture healing, pain relief / swelling reduction, wound healing, muscle growth and repair, tendon repair, mobility of joints and the relief of dyspnea. . . . Cats do not have near the prevalence of orthopedic disease or ligament and muscle traumas as dogs do. . . . [Also, the] non-union of fractures in cats is rare. Osteo [bone] diseases . . . are rarely found in cats but can be found in all breeds and sexes of dogs. . . . It is suggested that purring be stimulated as much as possible when cats are ill or under duress. If purring is a healing mechanism, it may just help them to recover faster, and perhaps could even save their [lives].

—Elizabeth von Muggenthaler

 healing mechanism," 2001 and 2006

LIVER AND GALLBLADDER

The liver and gallbladder are complementary in function: they work together to aid digestion. In Chinese medicine, they share the same meridian. So, it’s not surprising to learn that they both grew from the same embryonic tissue that divided. One portion of tissue branches to form the liver, and the other branches to form the gallbladder.

Liver

The soft, pinkish-brown liver—weighing between 3 and 6½ pounds (1.3 to 3 kilograms)—is the second largest organ (the skin is the first). Located on the right side in the abdominal cavity just below the diaphragm, this remarkable organ has many jobs. It’s the waste disposal workhorse, detoxifying poisons and preventing them from recirculating through the bloodstream. It breaks down, or converts for the body’s use, pancreatic, thyroid, sex gland, and other hormones. It stores vitamins and minerals and activates Vitamin E. It helps with immune protection by producing antibodies (which help eliminate pathogens). When there’s too much glucose in the bloodstream, the versatile liver converts it to glycogen. However, if there’s too much glucose at one time for the liver to convert, the glucose gets stored as body fat.

The liver helps digest carbohydrates and proteins, but it’s best known for making bile to digest fats. It makes small amounts of bile at a time. What’s not needed immediately in the small intestine during a meal is stored in the gallbladder. Fatty foods burden a poorly functioning liver, requiring bile supplements—especially if the

Phase 1 and Phase 2 Liver Nutrients

The liver detoxifies in four stages. During Phases 1 and 2 especially, large amounts of many nutrients are required. During Phase 1, the liver produces *metabolites* (wastes) that can be more toxic than the original substances. During Phase 2, Phase 1 metabolites are neutralized or changed into more benign material. Many people feel bad during the first two phases because there are insufficient levels of nutrients for the liver to complete its job. Phase 2 nutrient deficiencies are common with chronic conditions.

Phase 1 Nutrients:

- ◆ Vitamins B2, B3, B6 and B12
- ◆ Folate
- ◆ Glutathione
- ◆ Flavonoids

Phase 2 Nutrients:

- ◆ Vitamins B5, B12 and C
- ◆ Amino acids: methionine, cysteine, glycine, glutamine and taurine
- ◆ Folate
- ◆ Choline
- ◆ Magnesium
- ◆ Glutathione

Herbal Support for the Liver (All Times)

- ◆ Milk thistle (Silymarin)
- ◆ Dandelion root
- ◆ Bupleurum

gallbladder has been removed (leaving no bile reserves in the body).

The liver is the only organ that routinely regenerates itself. As little as one-quarter of a liver can regenerate into a whole liver because most of its cells can act as stem cells, capable of creating any body tissue. Medical terms related to the liver are based on the Greek word *hepar* for liver.

Signs of an overworked liver include elimination and digestion issues: bloating, nausea, constipation, diarrhea, and especially stomach upset when eating fatty foods. Other symptoms are sensitivity to chemicals (tobacco smoke, perfumes, solvents, etc.); fibromyalgia; chronic fatigue; negative mental states (depression, irritability and anger); blood sugar fluctuations; hormone imbalances; circulatory problems; joint and muscle pain; headache at the eyes; pain between the shoulder blades; bad breath; body odor; and dark circles under the eyes. Another sign of liver distress is trouble losing or gaining weight, which makes sense because thyroxine, which is produced by the

thyroid gland and controls metabolism, is converted by the liver into the active form, liothyronine, that actually reaches the cells.

The most important nutrients for the liver are water, rest, and protein (although the liver won't work well, either, if you eat too much protein). Too many carbs and sugars impair liver function. Avoid noxious chemicals and harsh spices. Fresh vegetable juices, including some beet, will help. Eliminate most fats, especially dairy. Of course, don't eat fake or rancid fats such as canola, or any nut oils.

Also see **CHEMICAL SENSITIVITY / POISONING**.

Amoeba Hepar Abscess

Abscess, or cavity filled with pus (accumulated dead white blood cells), caused by amoebic infection.

344 + 510 + 943, 605

Amoebic Dysentery / *Entamoeba histolytica*

Entamoeba histolytica is a dangerous protozoan that causes amoebic dysentery, an infection of the liver and digestive tract. Symptoms include severe diarrhea, ulcerated open wound, fever, and blood in the stool. Also see **BACTERIA**, "*Salmonella typhi* / Typhoid Fever" and "*Shigella*."

First try (from Dr. Garvey): 148, 166, 308, 393, 631, 778

From Dr. Hulda Clark: 19168.02, 954.32

Then try: 333 + 523 + 768 + 786, 465, 660 + 690 + 727, 787, 802 + 1550, 832, 880, 1552 for accompanying infections.

Banti's Disease

Blood vessels between the liver and intestines become blocked, leading to anemia, vein congestion, an enlarged spleen, bleeding of the stomach and intestines, and ultimately cirrhosis of the liver.

1778

Biliary Cirrhosis

See "Cirrhosis of the Liver / Biliary Cirrhosis" in this section.

Biliary Headache

Headache from a toxic, overworked liver, often occurring after fatty meals.

3.5, 8.5

Biliousness

Excess bile in liver, with constipation, headache, and vomiting.

21.34, 465, 660 + 690 + 727, 787, 802 + 1550, 832, 880, 10K, 40K

Bilirubinemia

See "Jaundice / Bilirubinemia" in this section.

Cancer of the Liver

See “Liver Cancer” under **CANCER**.

Cirrhosis of the Liver / Biliary Cirrhosis

Inflammatory condition of the liver during which bile flow through the liver is obstructed.

Enlarged Liver

465, 660 + 690 + 727, 787, 880

Enterohepatitis

Inflammation of large intestine and liver.

552, 932, 953

Fluke, Liver / Oriental *Clonorchis sinensis*

Transmitted when raw fish is eaten, this fluke lodges in the liver bile ducts of humans, dogs, cats, pigs and rodents, thickening the duct lining and inflaming the surrounding liver tissue. It grows up to 10 inches long and infects about 30 million people primarily in Japan, Korea, China, Taiwan, and Vietnam.

2K

From Dr. Hulda Clark: 21259.08, 1058.43

Fluke, Liver / Sheep Liver Fluke / *Fasciola hepatica*

Infecting humans and cattle as well as sheep, the flukes are transmitted if contaminated vegetation is eaten. They lodge in the liver bile ducts, thickening the duct lining and inflaming the surrounding liver tissue. They are found in the US, UK, Europe, Middle East, Asia, Africa, and Australia.

14, 275, 826, 830, 834

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

Adult fluke:

KHz set: 421350 (lowest), 425K (optimal), and 427300 (highest)

Hz set: 1044.42 (lowest), 1053.47 (optimal), and 1059.17 (highest)

Larval stage:

KHz set: 423800 (lowest), 427K (optimal), and 430600 (highest)

Hz set: 1050.50 (lowest), 1058.43 (optimal), and 1067.35 (highest)

Fluke eggs:

KHz set: 422K (lowest), 425K (optimal), and 427600 (highest)

Hz set: 1046.03 (lowest), 1053.47 (optimal), and 1059.91 (highest)

Also from Clark: 21159.50 (eggs) and 21259.08 (larvae)

Fluke, Liver (unspecified)

Worms appearing in the liver and other places.

First try: 143, 238, 275, 676, 763, 6641, 6672

Also try: 15, 55, 524, 854, 2K

Hangover

Acute toxicity in the blood and lymph alcohol ingestion. Symptoms include head and body aches, gastrointestinal disturbances, blunted motor responses, and malaise. Also see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, “Alcoholism.”

146, 522, 10K, 40K

Hepatitis, all types

Highly contagious disease causes liver inflammation, nausea, disturbed appetite, vomiting, joint pain, fever, and jaundice. Skin and eyes may be yellow as large amounts of bile are released into the blood. This condition is often caused or exacerbated by poisoning from drugs or other chemicals. The virus is carried in bodily fluids: blood, saliva, and also semen—which is why hepatitis is sometimes considered a sexually transmitted disease (STD).

Hepatitis, General

224, 317, 552, 932, 953 (all from Dr. Garvey), 28, 329, 470.6, 477, 483.3, 660 + 690 + 727, 802 + 1550, 880, 922, 941.4, 966.6, 1351, 1882.7, 1933.2

Also try frequencies for “*Schistosoma mansoni*,” which can cause symptoms similar to hepatitis: 329, 9889

Hepatitis A

321, 3220 (both from Garvey), 333 + 523 + 768 + 786, 346, 414, 423, 487, 558, 578, 693, 717, 878

Hepatitis B

334, 433, 477, 574, 752, 767, 779, 869, 876

Hepatitis C

Set 1: 20, 28, 72, 95, 125, 146, 166, 250, 444, 600, 650, 665, 802, 880, 1500, 1550, 1600, 1865, 2489, 3176, 3220, 5K, 10K

Set 2: 166, 224, 317, 329, 482.6, 528, 633, 929, 930, 931, 932, 933, 965.1, 1371, 1930.3, 2189

Hepatitis, More

If the above frequencies do not work: 166 (from Dr. Garvey), 1.2 + 250, 20, 95, 125, 146, 160 to 284, 321, 433, 444 + 1865, 447, 458, 534, 600 + 625 + 650, 768, 777, 788, 1041, 1600, 2189, 2489, 3176, 3220, 9670

Liver–Gallbladder Cleanse

Introduction

Physiology. The liver contains many biliary tubules that deliver bile to the gallbladder through the bile duct. The attached gallbladder stores bile because the liver cannot make large amounts at one time. Fats trigger the gallbladder to empty bile into the small and large intestines. In many adults and even children, the biliary tubules are loaded with gallstones that cannot be seen on gallbladder X-rays because most stones are too small and don't contain calcium (visible to X-rays). Also, the worst stones tend to be in the liver. As stones multiply and enlarge, four problems occur: The pressure on the liver prevents it from producing enough bile and the bile duct becomes more blocked. The liver cannot detoxify poisons such as solvents and parasites. Cholesterol levels may rise due to impaired liver function. And the porous gallstones can pick up bacteria, viruses and parasites that pass through the liver, which causes infection.

The Stones. There are many types of gallstones, most of which contain cholesterol crystals. The crystals can be black, red, white, tan, or bile-coated green. The late Dr. Hulda Clark observed many stones imbedded with what might be the remains of flukes. Other scientists have found clumps of bacteria at the center of each stone—suggesting that the body forms stones for protection, similar to how an oyster creates a pearl around an irritating grain of sand.

Some wonder if the residue from these cleanses is food rather than stones. Clark pointed out that food residue sinks, but gallstones float because they contain cholesterol. The concentric circles and crystals of the eliminated cholesterol exactly match textbook pictures of gallstones. Some soft, waxy, floating cholesterol crystals do not form into round stones, but they *would* eventually harden if allowed to sit in the liver and bile duct.

Effectiveness of This Cleanse. Establishment medicine claims that gallstones are rare; that they aren't linked to allergies, digestive upset or impaired liver function; and that removing the gallbladder eliminates the problem. These beliefs conflict with how the body actually works. Dr. Clark observed that even with the gallbladder removed, people eliminate green, bile-covered stones with this cleanse. This cleanse painlessly removes most stones, gravel, crystals and other debris from the liver, gallbladder and bile ducts, which helps the liver more efficiently purify the blood.

Each liver cleanse is sometimes observed to “cure” a different set of allergies, suggesting that the liver could be compartmentalized, with different duties allocated to different parts. This cleanse alleviates pain in the upper back, shoulders, and upper arms. It also tonifies the intestines. The colon may be sluggish due to inadequate bile secretion. If stones are blocking the bile ducts, there won't be sufficient bile; so eliminating stones could help restore colon function. Many practitioners observe improved digestion in people who do this cleanse. Also, after a series of cleanses, it's not uncommon for people originally scheduled for gallbladder surgery to not need it!

People who do this cleanse every month report passing fewer and fewer stones with each successive cleanse. Dr. Clark stated that a person may have to pass up to 2000 stones over a year-long period before the liver is clean enough to eliminate allergies and body pain. Symptoms, which may diminish or disappear, might return as stones from the rear of the liver travel forward. However, the reappearance of symptoms is temporary.

Preliminary Preparation (optional). (a) Before you do this liver-gallbladder protocol, consider an herbal kidney cleanse. The kidneys filter substances that don't belong in the bloodstream or aren't needed. (b) For two days prior to the cleanse, and/or on Day 1 of the cleanse at 3:00 p.m., you may give yourself coffee enemas (see Chapter 3) to clean the colon and stimulate liver function. (c) Some sources suggest drinking one quart a day of unfiltered apple juice for three days before the cleanse, because the malic acid in apples helps soften and flatten the stones that will be released. I think this is a very bad idea, because apples are abundant in fructose—the very sugar that the liver has problems handling (see Chapter 3)! It's wiser to take malic acid capsule supplements. *Caution: If you are ill, wait until you feel better before doing this cleanse; otherwise, it may send you straight to bed!*

Cleanse Days. Choose 36 consecutive hours when you have access to a toilet and can rest. Don't take nutritional supplements not specified here, or medications (unless your doctor tells you to). Otherwise, success could be hindered. On Day #1, don't eat fat. Eat fruit, vegetables, non-glutinous grains, protein powders, or (in the early morning only) steamed chicken or white fish. This allows bile to accumulate and build pressure in the liver, which pushes out stones.

If Problems Develop. Most people find this cleanse to be safe. However, if you feel pain from your torso to your throat, there might be a gallstone stuck in a bile duct. (Dr. Clark said that the appearance of clay-colored stool also indicates bile duct blockage.) To relax the spasms of the bile duct, take a heaping tablespoon of Epsom salts in $\frac{3}{4}$ cup of water on an empty stomach. The bile duct should relax within 20 minutes. If it does not relax and you still feel symptoms, immediately consult a holistic professional familiar with liver cleanses. Spasms may indicate the presence of parasites.

This cleanse is best done once every four weeks. The time between cleanses allows the existing stones to move forward in the liver, which enables them to be expelled during the next cleanse. You'll know you are finished when no more stones pass. If you are ill, weak, pregnant, nursing, or elderly, please seek holistic medical supervision!

Ingredients

- ◆ 4 TBS Epsom salts (magnesium sulfate). The label will say for both internal and external use. The magnesium opens the bile ducts, which allows the stones to pass easily. This ingredient is critical to your success!
- ◆ 24 ounces (3 cups) of filtered water.
- ◆ 1/2 (or 1/3) cup olive oil (light or non-virgin oil, which is easier to swallow).
- ◆ 1/2 (or 1/3) cup citrus juice, made from *fresh* grapefruit (preferably pink or red), fresh lemons, or a combination of both. Do not use concentrate or store-bought juice; this won't blend well with the oil you'll be drinking.
- ◆ *Optional:* (a) Ornithine (an amino acid), to help you sleep—4 capsules if you normally don't have problems sleeping, and 8 capsules if you do. (b) Starting three days before the flush, take 600 mg of malic acid 3 times a day for every 100 pounds of body weight. (c) 1 TBS of Vitamin C powder to nullify the taste of Epsom salts.

Equipment

- ◆ One 1-quart jar with a plastic (non-metal) lid for the Epsom salts mixture.
- ◆ One pint jar with a plastic (non-metal) lid for the citrus juice-olive oil mixture.
- ◆ A citrus juicer. This is mandatory, because you'll need fresh squeezed citrus juice.

Procedure – Day 1

You will need to eat foods that digest relatively quickly so your stomach can empty by evening. If you're able to fast on liquids, you may drink the fresh squeezed juice of 12 grapefruits until 5:00 p.m. If you're eating solid food, finish eating by noon (but you can drink a small amount of grapefruit juice until 5:00 p.m.). Choose light starches with no added fat, such as cooked oatmeal or baked potato (no milk, butter or sour cream), steamed vegetables, and/or green salads. Avoiding fats allows the fat-digesting bile to build up in the liver and gallbladder. If you are carbohydrate intolerant, eat low-carb, no-fat rice or pea protein powder in water. Some people manage with steamed codfish or flounder (without skin) or steamed chicken breast (white meat only, no skin) for the morning meal.

12:00 PM: Stop eating solid food, or you may feel uncomfortable later and the cleanse won't work as well. Mix 4 TBS of Epsom salts and (optional) 1 TBS of Vitamin C powder in 3 cups of cold water in the 1-quart jar. If you don't use Vitamin C powder, you may add a very small amount of citrus juice to the Epsom salt mixture just before drinking it.

6:00 PM: Drink 3/4 cup of the Epsom salts. This may cause diarrhea. Don't be alarmed; Epsom salts have a laxative effect.

8:00 PM: Drink 3/4 cup of the Epsom salts. If you didn't have diarrhea earlier, you may experience it now.

The timing of the main portion of the cleanse is relatively critical in achieving success. Try not to be more than 10 minutes early or late for anything that follows next. Be ready to go to bed immediately after the 10 p.m. drink.

9:45 PM: Into the second jar, pour all of the olive oil, along with the grapefruit and/or lemon juice. Close the lid and shake the jar hard until the contents are thoroughly blended.

10:00 PM: Drink the olive oil and citrus juice standing up. Take the optional ornithine with the first sips. Drink it all immediately; but if you're weak or elderly, you may drink it over a period of 5 minutes. *Lie down* on your right side for at least 30 minutes, with your knees up to your chest in a fetal position. The sooner you lie down, the more stones you'll eliminate. The oil you drank—much more than the body normally processes at one time—will cause the liver and gallbladder to spasm and dump all available bile, along with stones, gravel and crystals. You may feel stones traveling along the bile ducts. After 30 minutes, you may lie on your back. If you can't sleep, try to remain in bed for another 20 minutes. After that, if you feel nauseated, take 1/2 (or 1) teaspoon of activated charcoal with 1 (or 2) glasses of water.

Chinese medicine reminds us that the liver is sensitive to feelings of resentment, vindictiveness, and hate. The expression "venting bile" refers to someone who is very angry. So send positive, loving thoughts to your liver.

Procedure – Day 2

Next morning (6:00 a.m. or later): Take your third dose of the Epsom salt solution. If you're nauseated, take 1/2 (or 1) teaspoon of activated charcoal with 1 (or 2) glasses of water, wait an hour, and then drink the Epsom salts. The Epsom salts act as a laxative, and will induce many loose bowel movements later.

2 hours later: Take your fourth (and last) 3/4 cup of Epsom salts. Go back to bed if you want.

After 2 more hours: You may get up and eat. Some people prefer something light, while others want to eat normally immediately. Expect to have diarrhea on this second day. This is normal, due to the effect of the Epsom salts.

Icterus, Hemolytic

Chronic jaundice from a malfunctioning liver. Its bile pigment, distributed to the blood, turns the skin yellow, often accompanied by anemia (deficiency or malfunction of red blood cells). This condition can have many causes, from organ disturbances to poor nutrition. See a health professional. If your liver malfunctions, your system can be poisoned quickly. 243, 768

Jaundice / Bilirubinemia

The bilirubin, orange-yellow bile pigment resulting from the normal breakdown of red blood cells, is not eliminated by the liver and instead circulates back into the blood, turning the skin yellow. Also see **LIVER AND GALLBLADDER, Gallbladder; BACTERIA, "Leptospira / Leptospirosis";** and "Fluke" entries under **PARASITES, PROTOZOA AND WORMS.**

First try: 1.2 + 250, 649, 717, 726, 731, 734, 863, 9305

Also try: 10, 20, 72, 95, 125, 146, 444 + 1865, 600 + 625 + 650, 802 + 1550, 880, 1500, 1600

Lipoma

Fatty tumor, usually benign and in clusters, just under the skin. Liver dysfunction and faulty fat metabolism may be involved. Eliminate dairy. Consider bile supplementation. Massage lipoma with castor oil and/or rub with rosemary essential oil.

Also see **CANCER, "Liver Cancer"** in case the tumors become malignant, along with other entries in this section.

First try: Sweep 7–10 Hz for 1 hour.

Then try: 47, 440, 606, 709 (each for 5 minutes). Also sweep 2K–2200; or do 2K–2200 in increments of 5 Hz, staying on each number for 30 seconds to 1 minute

Liver Cancer

See under **CANCER.**

Liver Function, to Support and Balance

Frequencies alone won't fix this. See Insert on pages 758–759, "Liver–Gallbladder Cleanse."

33.13, 537, 751, 802 + 1550, 1552

Lymphoma in Liver

See "Lymphoma, Non-Hodgkin's" under **CANCER.**

Necrosis of Liver

Death of some areas of tissue, surrounded by healthy parts. Also see **BACTERIA, "Listeria monocytogenes / Listeriosis"** and the various "*Schistosoma*" entries under **PARASITES, PROTOZOA AND WORMS.**

33, 33.13, 802 + 1550, 1552

Stones in Liver

Hardened mineral material that can cause pain and inflammation. To eliminate them, see "Gallstones" under **LIVER AND GALLBLADDER, Gallbladder.**

21

Gallbladder

Not all mammals have a gallbladder. In humans, this organ is pear-shaped, about 2¾ to just under 4 inches in length (7 to 10 centimeters), and dark green due to its contents (bile). The gallbladder concentrates and stores less than ¼ cup (50 milliliters) of bile. The bile, made by the liver to digest fats, is released into the duodenum portion of the small intestine by the gallbladder when food enters.

Sometimes the bile becomes attached to mineral salts and is solidified into stones, which obstruct the bile ducts and cause pain. When the gallbladder becomes clogged with stones, many people have it removed. But the liver cannot produce enough bile for each fatty meal, so the gallbladder's function of storing bile is very important. A series of liver-gallbladder flushes can eliminate the stones. Also see **LIVER AND GALLBLADDER, Liver.**

Cholecystitis

Excruciatingly painful gallstone attack from the clogging of the bile ducts. Also see "Gallstones" in this section.

481, 743, 865, 928

Cholecystitis, chronic

Long-term inflammation of the gallbladder.

481, 743, 865, 928 (all from Dr. John Garvey), 432, 801, 1551

Dystonia with Osteitis

Gallbladder dysfunction with bone inflammation.

2.65, 20, 724, 736, 743, 770, 787, 660 + 690 + 727, 880, 3K

Gallstones

Usually formed by an accretion of cholesterol and bile salts in the gallbladder or bile ducts. The stones can number from one to a few thousand, and be as small as a grain of sand or as large as a golf ball. Up to 25% of all people may have gallstones. Formation of gallstones appears to be based on body chemistry, weight, diet, how often and how well the gallbladder contracts, and how completely and frequently the gallbladder empties.

Symptoms include abdominal pain (as the gallbladder contracts and stones pass through the bile duct), pain radiating up the back, digestive upset, and burning in the chest. Conventional medicine offers surgery at the point of life-threatening blockage, but Chinese Gold Coin Grass

(*Jin Qian Cao*), taken over time, will shrink the stones so they can be expelled. Make sure to do the Liver-Gallbladder cleanse (see pages 758–759); it will really help you. Specific homeopathic remedies, and fresh vegetable juices of greens and a little beet, may also help.

2.65, 30.5, 20, 444 + 1865, 660 + 690 + 727, 787, 800, 802 + 1550 880, 1552, 3K, 6K, 10K, 40K

End of Liver and Gallbladder section.

LOCKJAW

See “*Clostridium tetani* / Tetanus / Lockjaw” under **BACTERIA**.

LOCOMOTOR DYSFUNCTION / MOVEMENT DIFFICULTY

See “Ataxia” and “Ataxia, Spastic” under **MUSCLES**.

LOU GEHRIG’S DISEASE

See “Amyotrophic Lateral Sclerosis (ALS)” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

LUMBAGO

See under **MUSCLES**.

LUPUS ERYTHEMATOSUS

Autoimmune disease similar to rheumatoid arthritis. Symptoms include severe joint swelling, muscle pain, fatigue, lesions on skin and mucous membranes, destruction of facial cartilage, nausea and vomiting, fever, edema, scaly rashes that won’t heal, sun sensitivity, oral or nasal ulcers, inflammation of the lining of the lungs or heart, excess protein in the urine, certain types of seizures, abnormal changes in the blood, and often kidney failure. Environmental triggers include ultraviolet light, infections, medications, diet, and stress.

Nine out of ten people with Lupus are women. This is one of the most difficult conditions for mainstream medicine to treat, and can be fatal. Consult an experienced holistic health practitioner. See numerous entries under **PARASITES, PROTOZOA AND WORMS**; and try the general set for **CANCER**. See **BACTERIA**, “*Mycoplasma*, many types,” as *Mycoplasma* infection is often the beginning of autoimmune conditions. And see **BACTERIA**, “*Streptococcus* / *Strep*,” which can linger for years and cause autoimmune conditions as well.

From Dr. John Garvey (for 8 minutes apiece): 243, 352, 386, 921, 942, 993, 1333, 1464

Also try: 244, 442, 633 (for 5 minutes), 660 + 690 + 727, 702, 776, 787, 802 (for 8 minutes) + 1550, 880, 1850, 2008 (for 8 minutes), 2125 (for 4 minutes), 2489, 3612 (for 4 minutes), 40K

Also try: 205, 771, 842, 847, 921, 7865

Then try: 304, 481, 664, 678, 784, 1552, 2180, 2128

LYME / LYME DISEASE

See “*Borrelia*, all types / Borreliosis / Lyme Disease” under **BACTERIA**.

LYMPH CONDITIONS, MANY

See under **LYMPHATIC SYSTEM**.

LYMPHATIC LEUKEMIA

See “Leukemia, Lymphatic” under **CANCER**.

LYMPHATIC SYSTEM

The lymphatic system consists of a long series of channels called lymph vessels that run parallel to the blood vessels; lymph nodes (confusingly called lymph “glands”); and lymphocytes, a type of white blood cell that contributes to a strong immune response. The tonsils, adenoids, and spleen are also part of the lymphatic system. The tonsils consist of lymph tissue and are located in the throat. The adenoids (sometimes called the pharyngeal tonsils) consist of lymph tissue as well. They are located at the very back of the nose. The spleen—a fist-sized organ above the stomach, under the ribs on the left side—does not contain lymph tissue. However, it plays a vital role in reducing infection by purifying the blood. Foreign substances are filtered out from red blood cells. Then the rejuvenated red blood cells are stored in the spleen until the body requires extra blood.

Lymphatic fluid (or simply, “lymph”) begins as blood plasma (blood without red blood cells). The lymph fluid seeps out from small blood vessels into the spaces surrounding each cell. After absorbing waste products from cell metabolism, the fluid diffuses into the tiny porous lymph capillaries, where the lymphocytes inside the lymph capillaries clean and filter it, neutralize toxins, and destroy bacteria and viruses. Then the lymph fluid returns to the circulatory system.

Lymph fluid is clear but dense. The fluid is circulated throughout the body similar to the way the cardiovascular system circulates blood. However, because the lymphatic channels don’t have the equivalent of a heart to pump the fluid, exercise or massage are required to move the viscous lymph through the channels. Jumping on a rebounder (miniature trampoline) is a low-impact, very effective way to enhance lymphatic circulation (see Chapter 3, **Exercise**).

The 500 to 600 lymph nodes—abundant in the groin, underarms, neck, chest and abdomen—are constructed from connective tissue in a honeycomb shape. The ones in the neck that swell during illness are often called “swollen glands.” When the body is fighting an infection, lymphocytes multiply rapidly, making the lymph nodes swell. The two types of lymphocytes (which have different jobs) are T cells (so called because they mature in the thymus) and B cells (so called because they mature in the bone marrow).

Frequency and other electromedical devices that contact the body may move lymph better than freestanding plasma units because the dense tissue needs mechanical stimulation to promote flow. Also see more frequencies under **RESPIRATORY TRACT, Throat and Lymph Nodes**.

Always use 40K for tissue regeneration.

Adenoids, Swollen

Swollen lymphatic tissue located primarily in the throat, but sometimes in other places as well.

14, 20, 333 + 523 + 768 + 786, 428, 444 + 1865, 590, 660 + 690 + 727, 776, 780, 787, 802 + 1550, 807, 810, 880, 1570, 2K, 2170, 2720, 40K

Fluke, Lymph

Worm appearing in the lymph vessels.

157, 10050

Glanders

Caused by the bacillus *Pseudomonas mallei*, Glanders primarily involves the mucous membranes of the mouth and respiratory system, and occasionally the lymph nodes (where it is called Farcy). Mostly horses, mules and donkeys are affected, but occasionally the microbe is transmitted to humans, goats, sheep, cats, and dogs. Glanders is not common in the United States or Europe, but it still appears in Asia, Africa, and South America.

First try: 501, 660 + 690 + 727, 687, 743, 774, 857, 875, 1273

Also try: 20, 787, 880

Lymph Plaque

Buildup of solidified material in the lymph channels.

346, 596

Lymph System Circulation / Drainage, to Increase

Because lymph tissue is so dense, contact devices may work better than freestanding radiant plasma devices. Also see applicable frequencies under **CHEMICAL SENSITIVITY / POISONING**. Sauna therapy helps eliminate waste from the system. Make sure to replace missing electrolytes.

1.5, 3.6, 6.3 + 148, 146, 8, 10, 10.36, 15, 15.05, 15.33, 20, 20.5, 66, 146, 324, 428, 440, 444 + 1865, 465, 522, 528, 660 + 690 + 727, 676, 743, 787, 880, 1K, 2112, 3176, 5K, 10K, 40K (for as long as desired)

Short Set, Lymphatic Drainage

522, 146

Feeling overwhelmed or stuck?

First . . . read the end of Chapter 4,

*"A Short Course on
How to Give Yourself a Rife Session."*

This provides an excellent overview of
how to prioritize what you need.

Then . . . read the beginning of this chapter.

Lymphangitis

Inflammation of lymph vessels in humans and horses. Symptoms may include swelling, fatigue, aching head and muscles, fever, and chills. Many pathogens can be involved, such as the following. See **BACTERIA**, "*Streptococcus* / *Strep*," the many entries under **CANDIDA**, **FUNGI, MOLDS AND YEASTS**, and "*Herpes Virus Type 3* / *Herpes zoster* / *Chicken Pox* / *Varicella* / *Shingles*" under **VIRUSES**, **Herpes, all types**. Also see **CANCER** because lymph inflammation occasionally may develop into cancer. 574, 778, 1120, 1078, 3176

Lymphatic Leukemia

See "Leukemia, Lymphatic" under **CANCER**.

Lymphedema / Edema / Dropsy / Water Retention

Abnormal fluid retention in the arms, legs, face, neck or torso, caused by a sluggish or malfunctioning lymph system. Symptoms include warmth and redness of skin, decreased limb strength, restricted movement, and swelling in tissues. Clothing, shoes, and jewelry may be tight. The lymphedema may have no obvious cause, or it may develop after surgery or other trauma. If untreated, this condition could lead to cellulitis.

Cells in the body that are deprived of oxygen or nutrients, or are exposed to poison or physical trauma, lose potassium, absorb sodium and chloride, and expand from excess water. This excess water in the tissues causes the body to bloat and swell. Water retention is associated with many factors, including mineral (electrolyte) imbalance, the acidification of bodily tissues, and inadequate protein intake. Successful management of this condition depends on determining the cause of the water retention.

This edema is from a different cause than cardiac edema, and requires different frequencies. However, in case this condition is actually cardiac edema, please see the warning under **HEART, BLOOD AND CIRCULATION** before using this technology. (People who are wearing pacemakers, and those without pacemakers but who still have a heart condition, must limit their use of this technology.) Also see other frequencies in this **LYMPHATIC SYSTEM** section, including "Lymph System Circulation / Drainage, to Increase"; various kidney frequencies under **URINARY TRACT, Kidneys**; and **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Candida albicans*."

From Jimmie Holman: 25308, 26196, 27084, 27972, 28860, 29748, 30636, 31524, 32412, 33300, 34188, 35076, 36852, 37740, 38106, 38628, 40404, 41292, 43068, 43956, 44844, 45732, 47508, 48396, 49284, 50172, 51060, 51948, 52836, 53724, 55000, 55500, 58164

Also try: 6.3 + 148, 20, 24.3, 146, 440, 444 + 1865, 465, 522, 660 + 690 + 727, 787, 880, 3K, 5K, 10K, 40K (for as long as desired)

Lymphocytes, to Stimulate Production of

Lymphogranuloma, Malignant

See “Hodgkin’s Disease / Lymphogranuloma, Malignant” under **CANCER**.

Spleen, Enlarged, and other Conditions

The spleen, a bean-shaped organ positioned beneath the left breast at an angle, contains the largest mass of lymph tissue in the body, covered by connective and smooth muscle tissue. It is joined to the rest of the lymphatic system by lymph vessels. Unlike the lymph vessels, the spleen does not carry lymphatic fluid; and unlike the lymph nodes, the spleen does not filter or clean lymph. Instead, it produces what eventually turn into antibody-producing blood plasma cells. Antibodies, a basic component of the body’s immune line of defense, are the biochemical agents against specific microbial or foreign antagonists in the body. The spleen also breaks down bacteria and worn-out or damaged blood cells, and creates new blood cells.

20, 27.44, 35, 465, 660 + 690 + 727, 787, 802 + 1550, 880, 1800, 2170, 2720, 3176, 10K, 40K

Thymus Conditions

The thymus gland contains lymphatic tissue and belongs to the lymphatic system. It plays a major role in immune function by producing hormones that help with immunity and by also producing T cells (T is for “thymus”) that destroy pathogens. The thymus is affected by the emotions. Medical authorities consider it normal that the gland atrophies as we age, but proper nutrition and caring relationships will help ensure that the immune function remains vital. Light rhythmic thumping on the chest can stimulate the thymus to work more efficiently. See Chapter 3, **Exercise**, for more details on the lymphatic system.

MEN

Male and female genitals evolve from the same embryological tissue. This makes them *homologues*: they correspond in structure, character, and usually function. The following body parts are homologues: the male penile glans and female clitoral glans; the male corpora cavernosa and female clitoris; the male corpus spongiosum and female vestibular bulbs beneath the labia minora; the male scrotum and female labia minora and labia majora; and the male foreskin and female clitoral hood.

Even though male and female plumbing are different, and men often do not experience symptoms while women do, both sexes are susceptible to the same sexually related diseases. The asymptomatic man can carry the infection and pass it to his female partner. Therefore, it's very important (and courteous) to get a thorough checkup if you even suspect that you've been infected.

Penis

The human penis is made up of three columns of erectile tissue, the end of which forms a cone-shaped head or glans. The foreskin, on the head, consists of a loose fold of skin. The human penis differs from those of some other mammals. It contains no bone, but relies on engorgement with blood to reach its erect state. Erection in the male can occur in both sexual and non-sexual situations. The arteries supplying blood to the penis dilate, allowing more blood to fill the three spongy erectile tissue chambers in the penis, which then lengthens and stiffens. The average human penis is 5 inches (12.7 cm) in length when fully engorged with blood during arousal. Generally, size does not correspond strongly to reproductive ability.

Circumcision, the surgical removal of the foreskin, is common in Jews and Muslims, but under 40% of boys worldwide are cut. Most of Asia, Africa, Europe, and South America avoid it. This surgery is cited as religiously mandated, medically necessary (presumably for health reasons), or culturally defensible ("I don't want my boy to feel strange because he's not like the other circumcised males"). However, there's ample scientific evidence (not to mention common sense) that circumcision is unnecessary and harmful, and interferes with men's sexual pleasure. Even women report experiencing more pleasure during intercourse with intact than circumcised men. MRI data from Dr. Paul Tinari shows that circumcision changes the amygdala, the frontal lobe and the temporal lobe of the brain, most strongly affecting reasoning, perception, and emotions. His research team was threatened with legal action and a loss of their jobs if they published the study.²⁷

This practice is a less overtly extreme version of female genital mutilation (clitorectomy). Although a man may not consciously remember the process (which is almost always done without anesthesia), pain and fear remain imprinted in the body's tissues unless they're released. If you're uncircumcised and have concerns about sanitation, see "Smegma" in this section.

Herpes

See **VIRUSES**, *Herpes*, all types.

Jock Itch

Peeling skin, irritation and itching in the groin and genitals caused by *Epidermophyton floccosum*, a fungus that attacks skin, nails, and also the feet (where it's called athlete's foot). The fungi that attack the skin can be interchangeable and don't confine themselves to one area. Also see, under **CANDIDA, FUNGI, MOLDS AND YEASTS**, the various *Trichophyton*, *Microsporon* and *Microsporum* entries, "*Candida albicans*," and "General Fungus / Molds / Yeasts."

644, 766 (both from Dr. John Garvey), 856 (from Dr. Richard Loyd), 20, 345, 465, 634, 660 + 690 + 727, 784, 802 + 1550, 880

Lymphogranuloma venereum (LGV)

A venereal disease caused by *Chlamydia trachomatis*. Symptoms include inflammation, and enlargement and ulceration of the lymph glands in the groin area. From Dr. John Garvey: 430, 620, 624, 840, 2213 Also try: 430, 555.7, 866, 1111.4, 2222.8

If that doesn't work, try: 4710.5, 479, 620, 940.1, 942.9, 1880.1, 1885.9, 3760.3, 3771.7, 7520.5, 7543.4 (for *Chlamydia pneumoniae*, a different strain)

Seminal Vesiculitis

Inflammation, blockage, and often infection of the seminal vesicles (the sacs that temporarily store semen before it's emitted through the penis), caused by the bacterium *Micrococcus tetragenus*.

393, 433, 2712

Sex Gland Fever

20, 10K, 40K

Smegma

An unhealthy, smelly buildup of the fatty secretion by the skin between the glans penis and the foreskin in the male, or around the clitoris and labia minora in the female. Keep the area clean, using very mild and simple soaps, or if necessary, (for men only) a 3% solution of food grade hydrogen peroxide.

180 (from Dr. John Garvey), 153, 638

Syphilis

Highly infectious disease that can cause lesions in the sexual organs, fever, headache, swollen glands, rash on the hands and feet, and ultimately blindness, heart disease, and insanity if not treated. The pathogen enters the bloodstream during sex and can go anywhere in the body. Within 10 to 90 days after infection, a sore may appear on or around the

sex organs, rectum, or mouth. Syphilis can exist on a subclinical level. If untreated in pregnant women, it can cause birth defects and even death to the baby. Women with chronic vaginal discharge, or women and men with sexual dysfunctions, should try syphilis frequencies if other numbers aren't working. From Dr. Marty Monahan: 900, 789, 650, 625, 660, 511, 641, 633, 640, 827, 885

Also try: 600, 690, 727, 20, 120, 177, 658, 700, 902
From Royal Rife, possibly used on his #4 machine: 789K

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 346850 (lowest), 347K (optimal), and 347400 (highest)

Hz set: 859.76 (lowest), 860.13 (optimal), and 861.12 (highest)

Also from Clark: 17276.11

Trichomonas vaginalis

An aerobic protozoan parasite usually found in the vagina, causing itching, burning, and foul-smelling discharge. Although a woman is generally more symptomatic than a man from this infection, the man should be treated because the parasite lodges in his genital-urinary tract and can be repeatedly passed between sexual partners.

From Dr. Marty Monahan: 155, 447, 448, 450, 962
Also try: 610 + 692 + 980

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 378K (lowest), 381K (optimal), and 383600 (highest)

Hz set: 936.97 (lowest), 944.40 (optimal), and 950.85 (highest)

Also from Clark: 18968.87

Wart, Venereal / Condyloma

Benign but very painful, sometimes bleeding tumors with a branch or stalk and occasionally white patches, caused by the *Papilloma* virus. Men do not feel the negative effects of venereal warts as strongly as women do. In women, if this condition is not eliminated it can lead to cervical cancer. Also see frequencies for "Wart, Plantar," under **SKIN**.

First try: 110, 767 (both from Dr. John Garvey), 45, 265, 404, 446, 466, 489, 660 + 690 + 727, 874, 907, 1011, 1051, 2127.5, 5657, 9258, 9609

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

402850 (lowest), 407K (optimal), and 410700 (highest)

404050 (lowest), 404300 (optimal), and 404600 (highest)

Hz sets:

998.57 (lowest), 1008.85 (optimal), and 1018.02 (highest)

1001.54 (lowest), 1002.16 (optimal), and 1002.90 (highest)

If the above frequencies don't help, try these: 173, 466, 495, 644, 767, 787, 797, 877, 907, 915 (for 30 minutes), 918 (for 30 minutes), 953, 1500, 1600, 1800, 2008, 2170, 2720, 2489

Prostate

The prostate is a muscular gland that surrounds a portion of the bladder and urethra (the tube for urinating that leads from the bladder to the outside of the body). The prostate is partly responsible for the secretion of semen, the carrier fluid of sperm. If the prostate enlarges too much—a common occurrence during middle age (one estimate is about half the male population over 60 years of age)—it can crowd the urethra and impede the flow of urine. If urine flow is entirely stopped, it can damage the kidneys.

In addition to using frequencies, consider asking someone you trust to gently knead your prostate. Wearing a latex glove, the person inserts a finger into the rectum. Do not lubricate the latex glove with petroleum jelly. Petroleum jelly is made from crude oil and prevents respiration in any tissue that it touches! Coconut oil is safe and works well.

Prostate Conditions, General

1.1 + 73, 9, 9.19, 9.39, 9.4, 13.73, 20, 72, 95, 125, 408, 465, 660 + 690 + 727, 664, 802 + 1550, 787, 880, 2008, 2050, 2127.5, 2250, 2720, 40K

Prostate Cancer

See under **CANCER**.

Prostate Hyperplasia

Rapidly growing, abnormal increase of cells without the formation of a tumor, but with an increase in size of an organ or body part.

920

Prostate Tumor, Benign / Prostatitis

Benign tumors can become malignant, so also see "Prostate Cancer" under **CANCER**.

20, 60 + 100, 72, 95, 125, 146, 410, 442, 444 + 1865, 465, 522, 660 + 690 + 727, 688, 748, 766, 776, 787, 802 + 1550, 1875, 2008, 2050, 2127.5, 2170, 2250, 2489, 2720, 40K

Sexual Function

The ability to sexually function is more than whether a man can climax (“get it up”) or a woman can climax. It’s also related to one’s ability to show love and respect for others, to receive love, and to freely experience pleasure without guilt or shame.

Impotence, many types

The word “impotence,” like the word “frigidity,” has negative connotations. Socially and psychologically stigmatizing, it does not address the human aspect of sexual dysfunction: feelings of devitalization, powerlessness, and emotional distance—from oneself, others, and Source. To be impotent is to be robbed of one’s life force.

Impotence is generally considered a problem for men and not women, because the masculine identity is most often associated with the “performance” of keeping the penis erect during sexual activity. However, when a woman is unable to climax and enjoy herself sexually, this is as serious a problem as when a man has difficulty. In a sexual union, each person should feel enjoyment, and connect to himself / herself as well as the partner.

Physical components of sexual dysfunction include infection. Pathogens can be passed from one partner to the other even if a male is asymptomatic. The same microorganisms in both men and women can cause symptoms that lead to sexual dysfunction.

Get a thorough checkup. Psychological counseling may be advised, particularly in cases of sexual abuse, rape, and assault. Also see “Gonorrhea” and other entries in this section under **MEN, Urinary**. Finally, see various entries under **LIVER AND GALLBLADDER, Liver** because the liver processes and removes excess hormones. If it’s not operating efficiently, hormones can build up and become unbalanced in the body, which can interfere with sexual function.

1.1 + 73, 9.39, 9.4, 95, 20, 72, 95, 124, 125, 335, 465, 536, 600 + 625 + 650, 622, 660 + 690 + 727, 712, 787, 802 + 1550, 880, 2008, 2127.5, 10K, 40K (for as long as desired)

Infertility

Pollutants, chemicals and environmental toxins (plastics, herbicides, pesticides, drugs) have decreased the sperm count in males of all species and caused birth defects in the young. Less research has been done on the effects of toxins on women, although the drug DES is now banned because of the deforming effects on the developing embryo. Infertility has especially been linked to estrogens that are outgassed in plastics, and which are routinely added to the feed of commercially-raised (non-organic) cattle and poultry. Electropollution also has a huge impact, especially if a cell phone is

kept in a side pocket or one is constantly surrounded by electronics and WiFi. See “Impotence, many types” (above) and “Estrogen Production Levels, to Normalize (for Males and Females)” under **REGENERATION AND HEALING**. Also see “*Ureaplasma urealyticum*” under **BACTERIA**.

Testicles

The testicles (or testes) are the male sex glands. There are two, one resting in each scrotum (sac) hanging below the penis. The testicles secrete hormones including testosterone and androstenedione, which are responsible for the formation of secondary sex characteristics (among them a deepening voice and facial and pubic hair), the production of sperm cells, and metabolic functions unrelated to reproduction. The testicles operate via a complex feedback loop with the other endocrine glands.

Sperm cells are most easily produced in temperatures slightly less than core body temperature (98.6°F or 37°C). When it’s too cool for sperm production, the muscles holding the testicles contract so the testicles are closer to the warm body. When it’s too warm for sperm production, the muscles holding the testicles relax, lowering the testicles away from the warm body.

Epididymitis

Inflammation of the epididymis, the coiled tube at the back of the testicle that stores and carries sperm (which the testes produce). This condition also includes the epididymal ducts. You are strongly advised to use additional frequencies to prevent the infection from spreading to the testicles. Also see “Orchitis” in this section.

20, 660 + 690 + 727, 787, 880, 1500

Hormonal Imbalance

Check for nutritional deficiencies. Also see entries under **LIVER AND GALLBLADDER, Liver** because the liver processes and removes excess hormones. If the organ isn’t working well, hormones can build up and imbalance the body.

50.5, 537

Hydrocele

Excess fluid in a testicle or testicles. If you don’t know the pathogenic cause, see “Epididymitis” in this section. Experiment with more frequencies.

Orchitis

Testicle inflammation due to tuberculosis, mumps, gonorrhea, cancer, or other trauma.

9, 14, 20, 72, 95, 125, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2008, 2127.5, 2170, 2720, 2489, 10K, 40K (run this for as long as you want)

Seminal Vesiculitis

Inflammation, blockage and often infection of the seminal vesicles, usually caused by the bacterium *Micrococcus tetragenus*. The seminal vesicles are sacs that temporarily store semen before it is emitted through the penis.

393, 433, 2712

Testosterone Levels, to Normalize (Men Only)

1444

Testicular Cancer

See under **CANCER**.

Urinary

The urethra, part of the urinary tract closest to the tip of the penis, is a passage for both urine and semen. Symptoms of sexually related diseases will often appear in the urethra where the man would otherwise be asymptomatic. Therefore some conditions are included here; but for a more complete list see urinary tract.

Bladder Infection / Inflammation with possible Urethra involvement

Pain on urination, sometimes with pus in the urine. The urethra—the tube leading from the bladder to the outside of the body—is often infected along with the bladder. Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*.”

1.1 + 73, 1.2 + 250, 9.39, 9.4, 10, 20, 40, 72, 95, 125, 246, 360, 444 + 1865, 465, 498, 530, 600 + 625 + 650, 630, 642, 660 + 690 + 727, 724, 726, 771, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2045, 2050 (or 2045 to 2050 for 20 minutes), 2127.5, 2170, 2250, 2720, 10K, 40K

Chlamydia pneumoniae

A form of *Chlamydia*—see below. Run each frequency for 5 minutes.

Program 1: If your unit can't do decimals, round up or down to the nearest number. 4710.5, 470 to 472, 479, 620, 940.1, 942.9, 1880.1, 1885.9, 3760.3, 3771.7, 7520.5, 7543.4

Program 2: 471, 942, 1886, 3772, 7543

Chlamydia trachomatis

A bacterium involved in a sexually transmitted infection that can cause conjunctivitis (inflammation of the eye), urethritis (inflammation of the urethra or urinary tube), and proctitis (inflammation of rectum and anus), as well as lymphogranuloma venereum (venereal disease featuring inflammation and ulceration of the lymph glands). If not treated, an infection may result in miscarriage and infertility in women. It can be passed to infants in the birth canal, causing eye infections and pneumonia. This

organism may play a developmental role in cancer and Multiple Sclerosis, so see a doctor. Also see “*Chlamydia pneumoniae*” and “Lymphogranuloma venereum (LGV)” under **MEN, Penis**.

From Dr. John Garvey: 430, 620, 624, 840, 2213

Also try: 430, 555.7, 866, 1111.4, 2222.8

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 379700 (lowest), 381K (optimal), and 383950 (highest)

Hz set: 941.18 (lowest), 944.40 (optimal), and 951.72 (highest)

Also from Clark: 18968.87

Gonorrhea

Neisseria gonorrhoeae causes the sexually transmitted gonorrhea. Symptoms include inflammation of the genital mucous membrane and painful urination. There may also be inflammation in the joints and in the mucosa of the eyes, mouth and rectum. Infection can exist on a sub-clinical level. Although men usually experience burning during urination with perhaps drip or discharge from the penis, many women do not feel symptoms. *Neisseria gonorrhoeae* has become resistant to pharmaceutical antibiotics. If untreated, the infection can migrate to other areas and cause other conditions, including arthritis, prostatitis, cystitis, epididymitis, orchitis, pelvic inflammatory disease (PID), and endocarditis. See other categories under **MEN**.

From Royal Rife, possibly used on his #4 machine: 233K

600 + 625 + 650, 660 + 690 + 727, 712

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 333850 (lowest), 334K (optimal), and 336500 (highest)

Hz set: 827.53 (lowest), 827.90 (optimal), and 834.10 (highest)

Also from Clark: 16628.88, 927.90

Urethritis

Inflammation/infection in the urethra, the tube leading from the bladder to the outside of the body, characterized by burning on urination with possible discharge from the penis. Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*.”

1.2 + 250, 72, 95, 125, 444 + 1865, 465, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2127, 2170, 2720

End of Men section.

To Eliminate All Mites:

Douse clothing, bedding, soft furniture, and carpet with Enviro-One™, a botanical cleaner that's hypoallergenic and safe for the host but destroys bugs by suffocating them (see Appendices A and G).

MITE, BIRD / ORNITHONYSSUS

Attacks domestic birds, fowl, and sometimes humans. After birds abandon their rooftop nest, mites will enter a home.

From Jimmie Holman. Deliver the frequencies in precisely the order written. Note that they might not work on units other than those manufactured by Pulsed Technologies: 64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

From Dr. Hulda Clark: 877K and 878K (use both); 2173.87 and 2176.34 (use both), for units unable to reach the KHz range

MITE, DUST / DERMATOPHAGOIDES

Mites live in furniture, drapery, pillows, and carpet. They feed on the dead skin cells of humans. Allergies are generally not to the mites themselves but to the large amounts of feces they generate and expel into the air. It is unclear whether these frequencies actually kill dust mites or whether they reduce sensitivity to dust mite fecal matter.

From Dr. Richard Loyd: 476, 1332.03, 1690.5

From Dr. Hulda Clark: 707K or 1752.48 (for units unable to reach the KHz range)

Also try these from Jimmie Holman, although they have been primarily tested on other kinds of mites. The research team of Pulsed Technologies emphasizes that the frequencies be delivered in precisely the order written, and that they might not work on units other than those manufactured by Pulsed Technologies: 64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

MITE, FOLLICLE / DEMODEX FOLLICULORUM

Mites live in the hair follicles of humans. Although generally harmless, they can cause inflammation in the eyelashes, external ears, and facial skin. Also see **SKIN**, "Mange / Follicular Mange / Scabies."

From Dr. Richard Loyd: 476, 1332.03, 1690.5

From Jimmie Holman. Deliver frequencies in precisely the order written. They might not work on units other than those manufactured by Pulsed Technologies: 64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

From Dr. Hulda Clark: 682K or 1690.51 (for units unable to reach the KHz range)

MITES / SCABIES

See "Mange / Follicular Mange / Scabies" under **SKIN**.

MITOCHONDRIAL DISEASE

Mitochondria are tiny units that live inside nearly every cell. These powerhouses sustain life and growth, turning nutrients into fuel that provides energy for the entire body. When the mitochondria malfunction, the cells die. The many

debilitating physical, developmental and cognitive disabilities that can occur with this disorder include impaired growth; weakness, pain, and lack of coordination in the muscles; neurological malfunction including seizures, autism and learning disabilities, disorientation and memory loss; vision loss; hearing loss; blood sugar imbalances; gastrointestinal problems such as severe constipation; thyroid, adrenal and other glandular dysfunction; and organ failure.

Modern medicine states that this condition is genetically inherited and has no cure. But there are many environmental factors that can damage the cells' vital fuel-burning units. Heavy metal contamination, exposure to toxic chemicals such as pesticides, and severe infections (accompanied by immune inadequacy) can all play a huge role in weakening the mitochondria. Nutrients are essential: Vitamins B1, B2, B3, B6 and B12; the minerals manganese and magnesium; and the amino acids creatine, L-carnitine and D-ribose. Some people also supplement with malic acid. According to doctors David Brownstein and David Derry, iodine deficiency plays a key role. The mitochondria contain thyroid hormone receptors; and with enough iodine to help create thyroid hormone, there's sufficient increase in cellular energy production.

One very useful (and free!) protocol that you can do yourself is the breathing technique developed by Dutchman Wim Hof (see Insert, page 770, "The Wim Hof Method: Good For What Ails You"). The technique floods the body with oxygen, which energizes the cell membranes and feeds the mitochondria—thus ensuring that the entire body is in a higher-energy, more functional state. This method is being used by people all over the world, who greatly benefit even when devoting just 15 minutes a day to the breathing exercise. If you cannot do the breathing (or in addition to it), consider using medical grade ozone equipment or a hyperbaric oxygen therapy (HBOT) chamber.

There are no frequencies per se for this condition. Try the entries under **REGENERATION AND HEALING**, including 40K.

MOLD

See various entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

MOLE

See under **SKIN**.

MONGOLOIDISM

MONILIA

See "*Candida albicans*" under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

MONONUCLEOSIS, INFECTIOUS

See "Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)" under **VIRUSES**.

About Mitochondria

We are not made up, as we had always supposed, of successively enriched packets of our own parts. We are shared, rented, occupied. At the interior of our cells, driving them, providing the oxidative energy that sends us out for the improvement of each shining day, are the mitochondria, and in a strict sense they are not ours. They turn out to be little separate creatures, the colonial posterity of migrant prokaryocytes, probably primitive bacteria that swam into ancestral precursors of our eukaryotic cells and stayed there. Ever since, they have maintained themselves and their ways, replicating in their own fashion, privately, with their own DNA and RNA quite different from ours. They are . . . symbionts. . . . Without them, we would not move a muscle, drum a finger, think a thought. Mitochondria are stable and responsible lodgers, and I choose to trust them.

—Lewis Thomas (1913–1993)

Lives of a Cell: Notes of a Biology Watcher, 1974

MONONUCLEOSIS, OTHER

See "*Herpes Virus Type 5 (Human Herpes Type 5) / Cytomegalovirus (CMV) / Salivary Gland Virus*" under **VIRUSES**.

MORAXELLA CATARRHALIS

See "*Branhamella catarrhalis / Moraxella catarrhalis*" under **BACTERIA**.

MORGELLONS DISEASE

It is unclear when this condition first appeared. British physician Dr. C.E. Kellott may have identified Morgellons in 1935, although one source dates Morgellons to 2002. Kellott described Morgellons as a parasite infection from what appeared to be a filarial nematode, which acted like a silkworm, leaving behind a trail of bizarre fibers. Several years later, researchers Clifford E. Carnicom and Gwen Scott reported seeing bacteria that look like *Chlamydia pneumoniae* throughout the entire body.

Morgellons features unusual tangled black, blue, green, white, or red fibers sprouting from open sores on the skin or residing just under the skin. Some fibers are thicker than a hair, often containing other fibers inside them. Sometimes granules the size of sand grains, black specks, and fuzzballs of 1–3 mm appear in or on the skin. These fibrous structures cause excruciating pain, crusty lesions that don't heal, abnormal skin coloring and texture, burning, and itching, which cause people to feel as though small bugs were crawling under their skin, stinging and biting them. Other symptoms include enormous fatigue, impaired cognitive abilities including short term memory loss, and behavioral difficulties ranging from diagnosed attention deficit to bipolar to obsessive-compulsive disorders. There is usually extensive

The Wim Hof Method: Good For What Ails You

How This Helps Us

Wim Hof (born 1959 in the Netherlands) has developed a breathing technique—reportedly of Tibetan Buddhist origin—that can help restore health in dramatic ways. Breathing rapidly in succession, and then holding the breath, builds up the body's ability to assimilate, utilize, and retain the available oxygen. This confers profound benefits. The blood is highly alkaline, which means that pathogens are fewer in number. The immune cells are more efficient and fight infections better. Tissue cells also work optimally: the nervous system is calmer, muscles have greater strength and stamina, vision is sharper, and hearing is more acute. Most important, the increased oxygenation restores the mitochondria, the fuel-burning units of the cells, which improves energy. Energy can rise so much, in fact, that the breathing is best done in the morning or early afternoon rather than in the evening—otherwise, sleep may be impaired. Scientists studying Wim Hof have measured his blood alkalinity to be as high as 7.75, which is considerably over the medically accepted optimal limit of 7.45. With blood this alkaline, Wim and his advanced students can survive in an atmosphere that contains 30% less oxygen.

A stopwatch will help you time how long you can hold your breath. While some beginners can hold their breath for only 15 seconds, long-time students of Hof learn to hold their breath for 2 or even 3 minutes.

Basic Breathing Protocol

1. INHALE deeply and rapidly. Completely fill the abdominal cavity and lungs, but don't involve the shoulders, which doesn't help with breath intake and wastes energy. EXHALE more slowly than the Inhale. Keep the Inhale/Exhale smooth and connected; don't stop or pause in between. If you need to yawn, incorporate the yawn into the Inhale/Exhale cycle and don't break the rhythm. Breathe into any areas of the body where you feel pain or tightness.
2. Do this Inhale/Exhale at least 30 times. You are hyperventilating to flood your tissues with oxygen, so you'll feel tingling, and perhaps lightheaded or even mild pain in areas that are starved for oxygen.
3. On the 31st EXHALE, hold the breath on completion of the exhale for as long as possible.
4. When you can't hold your breath anymore, INHALE. Hold the breath for at least 10 or 15 seconds.
5. Repeat the above at least twice more. In Wim Hof's online course, he adds more breaths per cycle, and then more cycles, as the weeks progress.

Cold Exposure Protocol (Very Important)

Cold—whether brief or long cold showers, immersion in snow, or bathing in tubs of cold water or even ice—can stress the body in a way that's beneficial, as long as the exposure to cold is gradual and comfortable. Nicknamed "The Iceman" for his ability to maintain a normal body temperature in extreme cold, Hof reached the top of Mount Kilimanjaro in two days in 2009, wearing only shorts and shoes. Hof also achieved world records by lying in ice water for almost two hours, with not only his core but also his extremities remaining warm.

Repeated exposure to cold is an important part of Hof's regimen. Cold turns off the pain receptors to cold while still allowing the remaining (non-pain) receptors to register that the water is indeed cold and not warm. Another advantage of cold water exposure—especially at the neck, shoulders and spine—is that it activates the special brown fat patches that are plentiful there and which induce the burning of "regular" fat (white adipose) for fuel. This is how a normal body temperature is maintained without injury. It's also a mechanism by which normal body weight is maintained. Children are born with abundant brown fat, but it deactivates as they grow older. Adults can restore brown fat function with cold therapy. An April 2018 study, conducted at the University of Tokyo, not only proved (again) that brown fat is activated by cold, but also that properly applied cold can safely turn white fat into beige fat (similar to brown)—by altering how its genes are expressed (via biochemical changes stimulated by the sympathetic nervous system). The researchers concluded that metabolic disorders could, and should, be treated with cold rather than drugs.²⁸

Before or after a warm shower, take a cold shower for as long as you can, over both the front and back of the body. Alternating between cold and warm will help pump the lymph. Even one round of cold water will speed the burning of adipose and improve your resistance to cold. Many people begin with only 15 seconds but soon can tolerate several minutes or more. If you can't do physical exercise, try to become acclimated to at least one cold shower a day.

After only four or five weeks of this daily technique, students report better digestion, fewer food sensitivities and fewer airborne allergies, with psychological benefits of clearer thinking, more confidence, and greater optimism. Another advantage is better tolerance of both cold and heat. Hof's students further testify that even serious illnesses and disabilities can improve or disappear.

This is an unofficial account of the Wim Hof Method.

Please see Wim Hof's website: wimhofmethod.com

central and peripheral nervous system damage, sometimes with eye and gastrointestinal tract involvement. The majority of children with Morgellons are reported by their parents to have mood disorders or autism.

Cotton, genetically engineered with silkworm larvae, may be a source of the parasites that later live in the blood and spinal fluid of the host. (Most cotton is genetically engineered, and the fiber is present in not only clothing but also women's sanitary products.) After a period of up to three years, the worms emerge and produce fibers. In such subjects, the rashes sometimes bleed instantly when scratched, last a few days or several weeks before disappearing, and reappear later, often in different body areas. An analysis of Morgellons fibers, reported by Dr. Hildegard Staninger in October 2006, showed that their outer casing is comprised of high density polyethylene fiber (HDPE), a material often used in fiber optics. The fibers burn at 1700°F, do not melt, and fluoresce under ultraviolet light. Tissue biopsies from Morgellons subjects have also revealed silica glass tubules and carbon nanotubes (the worm-like objects); the black dots are carbon nanospheres. The itching and biting sensations appear to be the electricity that emanates from this nanotechnology.

Morgellons sufferers who were studied had no history in the fiber optic industry, and no reason to contact the material. However, HDPE is used in the nanotechnology field to encapsulate viral protein envelopes—including the kind now being sprayed on conventional crops. The viral envelope, which contains DNA, RNA and mutated RNA, is 1/150th times smaller than the original virus. A nanotechnology process is used to make HDPE molecules small enough to coat a viral envelope, which alters the very nature of the miniaturized material. An analysis of the fibers by Vitaly Citovsky, Biochemistry and Cell Biology professor at Stony Brook University in New York, showed the presence of *Agrobacterium*, a genus of Gram-negative bacteria capable of genetically transforming plant and human DNA.

Simply put, Morgellons is caused by genetic engineering and toxin exposure. As of 2006, the states with the highest number of cases were Texas, California and Florida—all with booming agribusinesses, known for growing genetically engineered and heavily sprayed crops. (After corn and soy, cotton is the most heavily sprayed crop in the US. Five out of the nine pesticides used on cotton are carcinogenic, and 70% of all cotton is genetically engineered. It would be wise to wear organic cotton clothing.) Many people with Morgellons also live in areas of heavy chemtrail spraying. In addition, the appearance of Morgellons coincides with a viral “food additive” that was formally approved by the FDA in August 2006. The virus, called a bacteriophage (which “eats” bacteria and is normally harmless to humans) was presumably introduced into the food supply to eliminate the pathogen *Listeria* (which causes foodborne illness similar to *E. coli*).

Authorities differ as to whether the living and non-living forms that characterize Morgellons are contagious, but the weak, vulnerable and infirm are more susceptible to this

condition. According to one source, over half of Morgellons sufferers have also been diagnosed with Lyme. Informal surveys reveal nearly 5,000 families in the United States with one or more members afflicted by Morgellons.

Many allopathic doctors believe that Morgellons sufferers have “delusional parasitosis,” but the holistic community understands that this horrific condition is all too real. There are several approaches to treatment. Colloidal silver (see Chapter 3) is taken internally and used as an external poultice, kept wet. It's reportedly more effective when silver is used with a small amount of DMSO (dimethyl sulfoxide), in a ratio of 10:1. Salt with Vitamin C causes a copious discharge of detritus and can provide relief; see the Insert, “Some Favorite Holistic Therapies for Lyme” on page 622. Liquid iodine added to the salt and Vitamin C appears to kill the parasites more thoroughly and affords more relief. Poultices of activated charcoal and especially clay could also help (see Chapter 3, **Detoxification**). Some people have found relief and real healing by spraying liquid iodine, in as strong a concentration as can be tolerated, on the affected sites. The Morgellon plastics smother red blood cells and prevent oxygen exchange, so ozone therapy and/or ultraviolet light (which creates ozone in the body) are being used with great success. Dr. Susan Kolb has developed a rigorous protocol of nutritional supplements, with antiparasitic and antifungal agents (many sufferers have *Candida*). She suggests a bath of 2 cups of Epsom salts, ¼ cup of Borax, ¼ cup of sea salt, and 10 opened alfalfa capsules. Be aware that the particles and parasites exiting might cause itching and pain.

One electromedical device that might help manage or even eliminate the parasites altogether is the Magnetex[®], a hand-held unit containing high-power, spinning neodymium magnets. The vortex produced by the Magnetex[®] literally pulls out debris from the cells, tissues, and even the cerebrospinal fluid according to one doctor. Fibers have been seen to emerge from the skin of Morgellons sufferers who use the Magnetex[®]. See Appendices A and C for details.

Morgellons sufferers may have Lyme, so see **BACTERIA**, “*Borrelia*, all types / *Borreliosis* / *Lyme Disease*.” Fungus may be involved, so see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*.” A new parasite has recently been found with Morgellons, so also see **PARASITES, PROTOZOA AND WORMS**, “*Funis vermis* / *Homo Funis vermis* / Ropeworm.”

The following frequencies are experimental.

Important! Use a plasma unit. Electrodes deliver electricity, which may stimulate the parasites rather than devitalize them.

Morgellons Parasites, Ruptures, and Fiber Growths

0.16, 0.3, 0.68, 0.9, 2.5, 5.50, 13.93, 93.5, 356.72, 380.67, 412.12, 424.40, 451.17, 483.52, 680

Morgellons External, on Skin

Running 2114 or 680 for a minimum of 30 minutes to stop stinging and itching.

More Experimental Frequencies

8, 20, 30, 120, 160, 304, 330, 432, 464, 500, 625, 665, 727, 740, 787, 800, 835, 880, 920, 1234, 1488, 1550, 1600, 1862, 2016, 2114, 2180, 2489, 2720, 2791, 2855, 2867, 2929, 3176, 3347, 3448, 4014, 4264, 4271.25, 5K, 5611, 5856.375, 5858.25, 7344, 10K, 40K (for as long as desired)

MOTION SICKNESS

Ginger root in all forms, including candied and as powder in hot water, is very effective against nausea. Also see **GASTROINTESTINAL TRACT, Systemic Conditions**, "Nausea."

4.9, 20, 72, 95, 125, 146, 190, 440, 444 + 1865, 465, 522, 600 + 625 + 650, 648, 10K

MUMPS

See "*Rubulavirus* / Mumps" under **VIRUSES**.

MUSCLES

There are different types of muscles. Voluntary muscles (which move due to our conscious intent) are comprised of striated fibers, their cells long and cylindrical with many nuclei. These are what we normally think of when we say "muscle." However, we have involuntary muscles too (moving without our conscious intent), comprised of smooth fibers. Their cells are elongated, with only one nucleus. The stomach and diaphragm are smooth muscles. The heart is unique, comprised of striated muscle, but it's not voluntarily controlled. The conditions here are meant to cover problems of mainly voluntary muscles, although many of the frequencies are used for conditions involving smooth muscles.

Sometimes, what are thought to be muscular conditions are actually problems with the fascia, or membranous connective tissue that encases the muscles. Sometimes the fascia is stuck together, which prevents the muscles from moving properly. This adhesion could be due to excess mucin, a hydrophilic (water-loving), sugar-protein compound naturally present in connective tissue. Over half of hypothyroidism sufferers have excess mucin in their bodies, which causes health problems in the connective tissue of skin, blood vessels, and nerves as well as muscles. An abnormally low metabolism equals an undercharged system, which will make it difficult to maintain normal body processes or retain benefits of healing; so see **GLANDS, Thyroid**, "Thyroid, Underactive / Hypothyroidism."

Also see **INFLAMMATION** and **INJURIES**. Read the **Exercise** and **Bodywork** sections in Chapter 3. If you're using a pad unit, place electrodes on either side of the inflammation site and include the frequencies 13.5 Hz and 40 Hz, which cover healing, as part of your program. Also see **REGENERATION AND HEALING**. If you have a radiant plasma unit, run 40K Hz for as long as you want to energize the tissues.

Ataxia

Movement difficulty, lack of muscle coordination. Results might be slow if nerve damage exists, but even brain cells can regenerate, so keep trying. Also see entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 807, 813, 880, 1500, 1600, 1800, 2170, 2720, 10K, 40K (for as long as desired)

Ataxia, Spastic

Movement difficulty, lack of muscle coordination accompanied by spastic or convulsive movements. Results might be slow if nerve damage exists, but even brain cells can regenerate, so keep trying. Also see entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

7.69, 7.7, 7.83, 8.25, 9.19, 9.2

Carpal Tunnel Syndrome / Repetitive Stress Injury (RSI)

Inflammation of the forearm, wrist and fingers, due to repetitive motion that places excessive stress on the tendons, ligaments, and muscles. For soft tissue injuries, electrode units may produce better results than plasma. One researcher thinks that 15 Hz may stimulate cells to receive calcium.

20.5, 6.3 + 148, 15, 146, 444 + 1865, 465, 522, 600 + 625 + 650, 660 + 690 + 727, 685, 700, 760, 776, 787, 802 + 1550, 832, 880, 1K, 1500, 2008, 10K

Contraction

Twisting of muscles and spine.

9.1, 110

Convulsions

Sudden, involuntary movements of the musculature. Also see “Epilepsy” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**. Seek medical advice for this condition.

660 + 690 + 727, 787, 880, 10K, 40K (for as long as desired)

With spasticity: 7.69, 8.25, 9.19, 9.2

Coordination Difficulties / Locomotor Dysfunction

Results might be slow if nerve damage exists, but even brain cells can regenerate, so keep trying. Also see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

7.83, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 787, 776, 807, 813, 880, 1500, 1600, 1800, 2170, 2720, 40K

Cramps, Leg / Intermittent Claudication

Caused by arterial spasm or narrowing due to arteriosclerosis. Another cause of cramps is deficiencies of the following minerals, or imbalanced ratios of the calcium/magnesium or sodium/potassium pairs.

45, 48, 10K, 40K (for as long as desired)

Dupuytren's Contracture

Contraction of the fascia (the membrane envelope around muscles) in the hand, causing the ring and little finger to bend into the palm so they can't be straightened. Massage with castor oil to loosen the fascia.

1.2 + 250

Dystonia, Vegetative

Dysfunction of the involuntary muscles.

20, 40, 120, 240

Fascia, to Soften

Fascia is the connective tissue envelope surrounding muscles. When it's tight or rigid due to emotional stress or adhesions, the muscles lose their flexibility and become stiff. Rolfing is massage that kneads the fascia, increasing muscle flexibility. Also see fibromyalgia and the “Cyst” entries under **TUMORS, BENIGN**.

20

Fibromyalgia

See fibromyalgia (the major category).

Finger Immobility, 4th and 5th fingers

See “Dupuytren's Contracture” in this section.

Frozen Shoulder

See “Shoulder, Frozen” in this section.

Inclusion Body Myositis (IBM)

See under **I**. Also see **AUTOIMMUNE DISORDERS**.

Natural Protocols for Muscle Aches

Magnesium. Abundant on Earth, in sea water and in plant chlorophyll, this mineral is key to over 300 enzyme pathways and cell functions. For stability, magnesium must be bound to something else. These substances affect absorption and confer different properties, although they can overlap. Taken orally, magnesium can be bound to an amino acid chelate: magnesium aspartate, with high absorption and retention, protects brain, heart, and muscles; arginate increases blood flow and improves glucose transport into cells; and glycinate is gentle on the bowels and induces calmness and relaxation. There are also magnesium citrate, a laxative that may inhibit kidney stone formation. Malate relaxes. Orotate inhibits the stress hormone adrenaline (thus helping with sleep), and penetrates cell membranes (thus delivering the mineral to mitochondria and the nucleus). Oxide relaxes muscles but is heavily laxative, so it's not taken often. Taurate helps the heart. And threonate crosses the blood-brain barrier, helping with mental focus. Manganese chloride, a viscous oily liquid, is applied to the skin to relax muscles. Magnesium sulfate, or Epsom salts, is added to bath water to relieve sore muscles.

Enzymes. All have anti-inflammatory properties: pancreatic enzymes, lumbrokinase, serrapeptase, nattokinase, and protease. Taken orally on an empty stomach, the enzymes are used in the bloodstream to scavenge inflammatory proteins instead of for digesting food.

Homeopathy. Single-ingredient remedies *Arnica*, *Ruta grava*, *Hypericum*, and *Staphisagria* are available in pellet form, taken orally. Combination formulas Rescue Remedy® and T-Relief® are available as pellets or liquids (taken orally) or ointments applied externally. Tuning Element™ Relief Patches lessen pain (see Appendix C).

Electromedical Equipment (see Appendix C for details).

- ◆ Avazzia™ or Tennant Biomodulator®
- ◆ BEMER
- ◆ LEDs (red or blue wavelengths)
- ◆ Magnetex®
- ◆ Wave Therapy

Heat and Cold. Cold packs usually work best within 72 hours of an injury. Cold constricts blood and lymph vessels, preventing excess blood and lymph accumulation at the injury site. Leave cold pack on until you feel numb (15 to 20 minutes), remove it for 15 or 30 minutes, and repeat the cycle two or three times (but not more). The swelling should substantially decrease. Use heat after swelling has decreased. Heat brings blood flow (and thus oxygen and nutrients) to the area.

Intercostal Neuralgia

Pain in rib musculature.

20, 125, 444 + 1865, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 2720, 3K, 40K (for as long as desired)

Involuntary Muscles, Dysfunction of

See “Dystonia, Vegetative” in this section.

40

Lumbago

Muscular ache across loins due to either unnatural twisting or too rapid cooling of overheated region

7.69, 7.7, 9.19, 9.2, 8.25, 72, 95, 125, 300, 444 + 1865, 660 + 690 + 727, 787, 800, 802 + 1550, 880, 40K

Movement Difficulty, with or without Spasms

See the “Ataxia” entries in this section.

Muscles, to Stimulate Healing of

13.5

Muscle Spasm

Rapid painful contractions of muscles, which can be due to overexertion, nutritional deficiency, or pH imbalance. A good electrolyte (liquid minerals) formula could really help, plus extra magnesium. Massage is usually helpful. Also see other entries in this section.

First try: 519.34 for 20 minutes

Then try: 6.8, 760, 2720 (for as long as needed)

Muscular Dystrophy

Disorder characterized by weakness and progressive wasting of skeletal muscles despite no concurrent wasting of nerve tissue. The ingestion or inhalation of the artificial sweetener aspartame (or similar poisons), mercury, benzene, lead, and toluene can cause the same symptoms. Veterinarians routinely put selenium in livestock feed to prevent muscular dystrophy; so check for selenium deficiency. Also see **PARASITES, PROTOZOA AND WORMS**, “General (unspecified)” and “Fluke” entries.

First try: 1.2 + 250, 3 + 230, 7.69, 7.7, 9.39, 9.4, 9.6, 20, 28, 153, 660 + 690 + 727, 787, 880, 2900

Then try: 146, 333 + 523 + 768 + 786, 465, 522, 555, 600 + 625 + 650, 776, 802 + 1550, 1850, 10K

**Muscular Dystrophy, Duchenne /
Duchenne Muscular Dystrophy (DMD) /
Pseudohypertrophic Muscular Dystrophy**

Caused by an absence of dystrophin, a protein that helps keep muscle cells intact. Symptoms include weak, wasted muscles, mostly in the hips, pelvis, thighs, and shoulders. Calves are often enlarged. Eventually, DMD affects all voluntary muscles, in addition to the heart and breathing muscles. DMD most often appears in boys age two to six years, who seldom survive beyond 30 years of age. Women can be carriers of DMD but usually exhibit no symptoms.

Light exercise only, swimming, hot baths, and massage may help. There has been preliminary success with green tea extract and the amino acid leucine. Also try frequencies for non-Duchenne muscular dystrophy, above. 153, 5000, 522, 146, 880, 787, 727

Myoma

Tumor comprised of muscle tissue. Also see **CANCER**.

127 (in case of malignancy), 253, 420, 453, 689, 832

In addition, sweep 420–482 for at least 30 minutes.

Myositis

Progressive weakness and inflammation of muscle tissue, due to physical injury, diabetes, or parasites. Also see **BLOOD SUGAR PROBLEMS**, “Diabetes / High Blood Sugar / Hyperglycemia”; injuries; and **PARASITES, PROTOZOA AND WORMS**, “General (unspecified).”

120, 122, 125, 129, 762, 1124, 1169

Neck, Stiff, including Spasticity

Involuntary movement or convulsive muscle contraction.

4.9, 6, 9.19, 9.2

Non-Spastic Paralysis

Convulsive, muscular rigidity accompanying partial paralysis. In some cases, progress might be slow.

8.25, 9.19, 9.2, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 10K

Pain due to Injury

0.5, 1, 1.1 + 73, 1.2 + 250, 10.5, 20.5, 5.8, 10, 20, 35, 40, 80, 125, 160, 320, 240, 2720, 6K, 10K, 40K (for as long as desired)

Reflex Sympathetic Dystrophy (RSD)

Involves muscles, nerves, skin, blood vessels, and bones. Severe chronic pain, inflammation, blood vessel or muscle spasms, insomnia, depression, and anxiety. Other symptoms may include short-term memory loss, balance and vision problems, jerky movements, muscle atrophy.

RSD affects mostly women in their 30s and 40s, and often follows a trauma: sprain, fall, infection, bone break, knife wound, heart condition, surgery, or spinal disorder. Symptoms might not appear at the original trauma site. Even light clothing or a breeze can augment pain, and subjects may be sensitive to loud noises or vibrations.

Check adrenal function, balance electrolytes, and consult a holistic health professional. There are no frequencies for this, so try other entries in this section. Also see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS** and **CHEMICAL SENSITIVITY / POISONING**.

Repetitive Stress Injury (RSI)

See “Carpal Tunnel Syndrome / Repetitive Stress Injury (RSI)” in this section.

Shoulder, Frozen

Painful shoulder. Severely limits mobility and primarily affects the tendons or connective tissue near joints.

660 + 690 + 727, 776, 787, 802 + 1550, 880, 40K

Spasm, Muscular

See “Muscle Spasm” in this section.

Spastic Ataxia

See “Ataxia, Spastic” in this section.

Spastic Paralysis

Convulsive, muscular rigidity accompanying partial paralysis. In some cases, progress might be slow.

7.69, 7.7, 20, 72, 95, 125, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 880, 10K

Sprain

Partial rupture or twisting of a joint and its tendon and ligament attachments (perhaps with muscle involvement), tearing the tissue fibers and causing pain and swelling.

Below are frequencies for pain due to injury, stiff neck, and some arthritis frequencies. Also see “Tendomyopathy” in this section.

0.5, 1, 1.1 + 73, 1.2 + 250, 20.5, 4.9, 5.8, 9.19, 9.2, 9.4, 10, 20, 35, 40, 80, 125, 320, 2720, 10K

Stiffness, General

0.5, 1, 1.2 + 250, 10.5, 20.5, 5.8, 10, 20, 40, 80, 125, 160, 240, 300, 304, 320, 328, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 1800, 6K, 40K

Tendomyopathy

Infirm condition of both the muscles and tendons, causing inflammation and pain.

0.5, 1, 1.1 + 73, 1.2 + 250, 10.5, 20.5, 4.9, 5.8, 9.2, 9.4, 10, 20, 26, 40, 80, 146, 160, 320, 465, 522, 2720, 3K, 40K (for as long as desired)

Tension—to Relax

6.8, 7.83, 20, 120, 240, 304, 760, 965, 6K

Tetanus / Lockjaw

The bacillus *Clostridium tetani* causes tetanus, an infectious and painful disease more commonly known as lockjaw. The person suffers persistent, continual contraction of some involuntary muscles. The spasms are focused in the jaw, throat, and face. Tetanus is often contracted by being punctured with a rusty nail. The homeopathic remedy *Ledum* is commonly used to treat this condition.

From Royal Rife, possibly used on his #4 machine: 234K 120, 244, 352, 363, 458, 465, 554, 600 + 625 + 650, 628, 660 + 690 + 727, 787, 880, 1142

End of Muscles section.

MUSCULAR DYSTROPHY, ALL TYPES

See under **MUSCLES**.

MYALGIC ENCEPHALOMYELITIS

See “Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)” under **VIRUSES**.

MYASTHENIA GRAVIS

There are no known frequencies for this condition. See **AUTOIMMUNE DISORDERS** for more information.

MYCELOID LEUKEMIA

See “Leukemia, Myeloid” under **CANCER**.

MYCOBACTERIUM AVIUM

See under **BACTERIA**.

MYCOBACTERIUM LEPRAE

See under **BACTERIA**.

MYCOBACTERIUM TUBERCULOSIS

See under **BACTERIA**.

MYCOPLASMA, ALL TYPES

See under **BACTERIA**.

MYCOPLASMA VIRUS P-1

See under **VIRUSES**.

MYCOSIS FUNGOIDES

See under **CANCER**.

MYOMA

See “Uterine Tumor / Myoma” under **TUMORS, BENIGN** or under **WOMEN, Uterus, Cervix, Ovaries and Fallopian Tubes**.

MYOSITIS

See **INCLUSION BODY MYOSITIS (IBM)**.

—N—**NAEGLERIA FOWLERI**

See under **PARASITES, PROTOZOA AND WORMS**.

NASAL CONDITIONS

See under **RESPIRATORY TRACT, Nose and Sinuses**.

NAUSEA, WITH OR WITHOUT CRAMPING

See **APPENDICITIS**; **MOTION SICKNESS**; entries under **GASTROINTESTINAL TRACT**; entries under **PARASITES, PROTOZOA AND WORMS**; and **WOMEN, Menstruation and Menopause**, “Menstrual Cramps.” Also check for pregnancy.

NECK, STIFF

See under **INJURIES**.

NECROSIS OF LIVER

See under **LIVER AND GALLBLADDER**, *Liver*.

NEMATODES

See “*Ascaris lumbricoides* / Roundworm” under **PARASITES, PROTOZOA AND WORMS**.

NEOPLASM

A neoplasm is a disorganized growth, also known as a tumor, in an organ or in tissue. See various entries under **TUMORS, BENIGN**; but if you suspect your tumor might be cancerous, see the many entries under **CANCER**.

NEPHRITIS AND NEPHROSIS

See separate listings under **URINARY TRACT**, *Kidneys*.

NERVE PAIN, ANY TYPE

See “Neuralgia, Brachial” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

NERVOUS SYSTEM, ALL ASPECTS

See **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

NEUROSPORA SITOPHILA

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

NIGROSPORA

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

NOCARDIA ASTEROIDES / NOCARDIOSIS

See under **BACTERIA**.

NON-HODGKIN'S LYMPHOMA

See “Lymphoma, Non-Hodgkin's” under **CANCER**.

NON-SPASTIC PARALYSIS / LANGUOROUS PARALYSIS

See “Paralysis, Non-Spastic / Languorous Paralysis” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

NOSE CONDITIONS

See **RESPIRATORY TRACT**, *Nose and Sinuses*.

NUMBNESS

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

You may not need every frequency in an entry.

Pathogens can mutate.

*Or, you may not know exactly
which pathogens you have.*

*If you cannot get a reliable test for pathogens,
to determine which frequencies you need
try muscle testing or dowsing (see Chapter 4).*

OAT SMUT

See “*Ustilago avenae* / Oat Smut” under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

OBESITY / OVERWEIGHT

An overabundance of fatty tissue in relation to lean muscle mass. People are considered overweight if, according to the Body Mass Index (BMI), they have 25% fat; obese if they have 30% fat; and severely or morbidly obese if they have 40% or more fat. Figures for the United States suggest that about 127 million adults age 20 years and older are overweight. About 60 million are obese, and about 9 million are morbidly obese.

The body contains two types of fat with distinctly different functions. White (or yellowish) fat is the most familiar and plentiful. It stores excess calories, which are broken down by the body and used for fuel under certain conditions. White fat also releases hormones that control metabolism. These hormones include insulin, growth hormone, adrenaline, cortisol, and leptin (which directly helps regulate appetite and hunger).

The second type of fat, brown fat, acquires its brown color from its content of iron-rich mitochondria, the fuel-burning units in cells. Brown fat keeps us warm because it burns white fat. More plentiful in children than in adults, brown fat is located primarily in the front and back of the neck, across the upper back, and even along the spine. (See Insert on page 770, “The Wim Hof Method: Good For What Ails You.”) When there's too much white fat in proportion to muscle tissue in the body, one of the hormones it normally produces, adiponectin, becomes scarcer or entirely absent. Adiponectin sensitizes the liver and muscles to the hormone insulin, which allows glucose in the bloodstream to enter the cells for fuel. But with less adiponectin, we become insulin resistant and fatter—and, in a vicious cycle, secrete less adiponectin, which makes us fatter, etc. We are also more prone to diabetes and heart disease. When white fat accumulates in the midsection as visceral fat—surrounding the abdominal organs as well as being just under the skin—the risk rises for diabetes, heart attack, and stroke. Fat people are also more prone to dementia.

Brown fat is generated by exercise, which can convert white fat to the more metabolically active brown fat. Brown fat is also created when the body produces melatonin during deep sleep. Regular exposure to cold temperatures also induces brown fat production. Overweight/obesity and lack of exercise impair the brown fat, making it less able or completely unable to burn calories.

The popular notion, that people who are fat simply lack willpower to stop eating, is simplistic and incomplete. Most overweight people are actually starving because they're malnourished. Lacking energy, the person often yields to a craving for empty calorie carbohydrates, which leads to insulin resistance and more obesity (as well as hypoglycemia

or diabetes), which leads to even more carb cravings. A lack of vital nutrients causes a cascade of other problems, including depression, heart disease, joint pain, sleep apnea, and increased susceptibility to infections such as cellulitis.

When a high carbohydrate diet is eaten, *Candida* and parasites can proliferate. These pathogens thrive by stealing vital nutrients from the host, who overeats to compensate for this lack of nutrition—thus compounding the overweight. What we call food cravings are often “Feed me!” messages from the pathogens. The toxic chemicals that these microorganisms excrete affect the brain of the host, causing the host to eat what’s best for the microbe, not the host. This is why a microbe-killing approach to overeating is an essential part of an overall approach.

Medical scientists have actually discovered what they call the “obesity virus.” Chickens and mice injected with the human Adenovirus-36 (AD-36) gained excessive amounts of fat. Apparently, when fat cells are exposed to AD-36, they begin to multiply, in some cases by 300%. Unlike other adenoviruses (which can cause colds, diarrhea and eye infections), AD-36 promotes weight gain. More recent reports also include AD-37 as a contributing factor in obesity.

Overweight can also be caused by, as well as cause, inefficient metabolism. The problem of low thyroid function, estimated to affect at least half the American population, plays a huge part in obesity. Too often, doctors rely on ineffective lab tests to determine hypothyroidism when they should be listening to their clients and basing treatment on symptoms, including body temperature on awakening.

Liver malfunction can also contribute to obesity. One of the liver’s many functions is to convert the inactive form of thyroid hormone (which merely circulates in the bloodstream) into its active form (which gets into the cells, where it’s actually utilized). The liver secretes bile to digest fats, but bile also triggers the release of an enzyme that converts the inactive thyroid hormone into its usable form. If the liver is overburdened with its toxin-neutralizing tasks, the bile it produces will be limited or of poor quality, and it won’t perform the conversion completely (if at all).

Hypothalamus malfunction also plays a role in obesity. That portion of the brain regulates all glands, the balance between the sympathetic and parasympathetic nervous systems, and the hormones that signal satiety and instruct the body to store fat or release it for fuel. Homeopathic human chorionic gonadotrophin (HCG) therapy is being used with limited success to help reset the body’s fat regulation mechanism—along with protocols to correct insulin, leptin, and thyroid hormone resistance.

Ongoing stress alone—whether caused by inadequate or unrestful sleep or physical and emotional trauma—can contribute to obesity. Adrenal function suffers, increasing cortisol levels. People with large bellies (sometimes called “beer bellies”) have cortisol-induced extra fat.

Research indicates that most thin people host different colonies of friendly gut flora than do overweight people. In December 2006, *Nature* published an article about gut

Nutrients and Herbs that Help Curb Obesity

- ◆ **Amino Acids.** These building blocks of protein are immediately bioavailable, and used by the body to build whatever is needed at the moment.
- ◆ **AMP-K (activated protein kinase) with Hesperidin.** Found in every cell, AMP-K regulates glucose uptake, decreases stored body fat, and eliminates cellular debris. With hesperidin (a citrus antioxidant), AMP-K stimulates activity and numbers of mitochondria, reduces fat in the belly and elsewhere, and decreases inflammation.
- ◆ **Black Cumin Seed (*Nigella sativa*) and its Oil.** This anti-inflammatory, digestive, antioxidant, and anticancer agent improves insulin resistance, especially when used in conjunction with exercise.
- ◆ **Chromium & Vanadium.** Together, these minerals balance blood sugar by opening the insulin receptors on cell membranes, thus increasing insulin sensitivity.
- ◆ **Magnesium.** Helps burn food as fuel and promotes oxygenation of tissues.
- ◆ **Probiotics.** In overweight people, friendly flora are fewer and types are limited. Supplementation helps.
- ◆ **Rose Hips.** The fruit of the rose plant stimulates the activity of brown fat, which burns adipose (fat) cells.
- ◆ **Sea Buckthorn Oil and Macadamia Nut Oil.** Both of these oils decrease the amount of fat that often accumulates around the abdomen (visceral fat). Be careful with Sea Buckthorn, however, as it can cause diarrhea when taken in excess.
- ◆ **Turmeric Root (or its extract, Curcumin).** Induces white fat cells to become brown fat through four different mechanisms, one of which is the production of more mitochondria. (See Insert, page 770.)
- ◆ **Vitamin B1 (Thiamine).** A vital nutrient that helps the body process carbohydrates (and improves mood).

microbiome. (“Microbiome” is a popular term used for all microorganisms, their genetic material, and their activities in a given habitat or ecosystem.) The authors wrote: “Comparisons of the distal gut microbiota of genetically obese mice and their lean littermates, as well as those [gut microbiota] of obese and lean human volunteers, have revealed that obesity is associated with changes in the relative abundance of the two dominant bacterial divisions, the *Bacteroidetes* and the *Firmicutes*. . . . Our results indicate that the obese microbiome has an increased capacity to harvest energy from the diet. Furthermore, this trait is transmissible: colonization of germ-free mice with an ‘obese microbiota’ results in a significantly greater increase in total body fat than colonization with a ‘lean microbiota.’ These results identify the gut microbiota as an additional contributing factor to the pathophysiology of obesity.”²⁹

Most technologically advanced societies encourage quickly made, empty-calorie, high-carbohydrate meals. Plenty of restaurants sell such food, cheaply. The only way to obtain nourishing, reasonably priced meals of organic vegetables and high quality animal protein is to devote the time at home to prepare those meals yourself. Few people can or want to do this, but proper diet (besides exercise and enough sleep) is key to avoiding obesity.

The right nutrients help prevent obesity, mood swings, emotional eating, and unhealthy food cravings. Protein builds muscle tissue. Fish oil, fat from grass fed beef and lamb, and olive and coconut oils nourish the body and promote satiety. See Sidebar on page 777, “Nutrients and Herbs that Help Curb Obesity,” and Julia Ross’s *The Diet Cure*. Keep in mind that infection is often accompanied by inflammation, a major factor in obesity.

Also see **BLOOD SUGAR PROBLEMS; CANDIDA, FUNGI, MOLDS AND YEASTS; LIVER AND GALLBLADDER; BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS; PARASITES, PROTOZOA AND WORMS; EATING DISORDERS; GLANDS, Thyroid; GLANDS, Adrenals**; and, under **REGENERATION AND HEALING**, “Hypothalamus Function, to Normalize” and “Endocrine System Function, to Normalize.”

General: 333 + 523 + 768 + 786, 666, 950.6, 958.8, 959, 959.6, 960.4, 962, 967.6, 969.3

Also: Sweep 124–126 for 30 minutes.

Adenovirus-36 (AD-36)

Adenovirus-36 together with Adenovirus-37 can cause obesity. Recently, researchers discovered that monkeys, mice, and chickens injected with the virus gain more weight than do uninfected animals. The virus causes the number of fat cells to increase, and also to triple in size (thus storing more fat). Studies also show that 20% to 30% of overweight humans are infected with the AD-36, compared to 11% of the nonobese population.

See under **VIRUSES**.

Adenovirus-37 (AD-37)

Together with frequencies for Adenovirus-36, it may eliminate obesity. See under **VIRUSES**.

Cellulite Elimination (experimental, to break down abnormal fascia and rupture fat cells)

Cellulite is an abnormal deposit of fat beneath skin that has a dimpled, lumpy, uneven appearance. The skin is usually pale, has a lower than normal body temperature, and is less elastic than normal skin. Affecting 90% of women, even if they’re slender, cellulite is mostly on the buttocks and thighs. Hormonal changes, poor nutrition, inadequate hydration, and lack of exercise contribute to the formation of cellulite. Excessive carbohydrates not only promote weight gain, but they dehydrate the system and (along with charcoal broiled and charred foods) harden the tissues.

The collagen fiber that helps keep fascia elastic is created from many nutrients including sulfur. Foods rich in sulfur include olives, cucumbers, celery, and eggs. The best form of exercise that helps keep the fascia elastic is stretching.

New research suggests that if an overweight area contains cellulite, a disorder of the fascial (connective) tissue may be involved. Some people try to break up abnormally fibrous fascia—which is encasing and protecting globules of fat—with deep mechanical pressure.

The following frequencies are reported to have been discovered by NASA (National Aeronautics and Space Administration), which was applying them via ultrasound to regrow fractured bone. When NASA realized that the frequencies were behaving in unexpected ways, the agency developed a technique called ultrasonic assisted liposuction (UAL). A small rod (cannula), inserted into the fat cells through a very small incision, applies the sound frequencies that literally burst the fat cells, which are then suctioned out of the body. Although the procedure is said to be gentler than conventional liposuction, it’s still invasive surgery. UAL produces high levels of inflammation and fluid buildup, and causes skin deterioration, blisters, hardening of blood vessels, blood clots, and damage to nerves and other tissue. Therefore, it’s worth trying the frequencies below. They are best applied with a pad unit whose electrodes are placed on either side of the fatty tissue. Electrode patches can also be used. Run each frequency for 10 minutes, and drink plenty of water before, during and after, to help eliminate the fat that’s released. Continue for at least seven days for best results; but we don’t have enough information to know whether the frequencies below will work with a frequency unit. Electrodes, placed on or near the affected areas, will probably work better for this purpose than radiant plasma. 171.9, 343.8, 687.5, 22K (see above for explanation on the best way to apply these frequencies)

Fat Elimination (“Fat Buster,” experimental)

This frequency is from Jeff Sutherland. Run 6028.99 for 40 minutes once or twice a week.

Also try: 20, 26, 48, 60, 72, 95, 125, 160, 180, 300, 333, 444, 1865, 522, 523, 555, 660, 690, 727, 768, 787, 802, 880, 942, 951, 952, 959, 960, 962, 968, 969, 1009, 1034, 1060, 1062, 1395, 1500, 1550, 2050, 2720, 4868, 5K, 6989, 7001, 7702, 7009, 7762, 7767, 10K

–P–

PAIN

Pain is the body's way of telling us that something needs attention. Infection, inflammation and injury are usually accompanied by some kind of pain. Drinking water can often help (see Chapter 3, **Water**). White willow bark, the original herbal "aspirin," is always used for pain. The amino acid L-phenylalanine inhibits the enzyme that degrades the body's natural painkiller endorphins; see Julia Ross's *The Mood Cure*.

Chronic pain is often related to low thyroid function, so also see **GLANDS**, *Thyroid*, "Thyroid, Underactive / Hypothyroidism." In particular, see the general information under **INFLAMMATION** and **INJURIES**. Make sure to read the Sidebar, "Supplemental Therapies for Injuries," on page 751. *Important! Don't use electrodes on the heart. See Chapter 4.*

General, Program 1: These are some popular frequencies for arthritis, fibromyalgia, and others. Run for 3 to 6 minutes each: 5, 20, 40, 47, 72, 80, 95, 104, 120, 125, 140, 304, 432, 440, 444, 464, 465, 660 + 690 + 727, 665, 787, 770, 776, 800, 802 + 1550, 880, 1552, 1840, 1865, 1998, 2008, 2127, 2720, 2489, 2720, 3040, 3176, 5K, 6K, 9K, 10K, 40K (for as long as desired)

Short version 20, 95, 2720, 3040, 40K (for as long as desired)

From Dr. Richard Loyd (especially for neck and back pain, and in this order): 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 138.57, 130.81, 146.83, 164.81, 174.61, 196, 220.2, 246.94, 138.57, 155.56, 185, 207.65, 233.08, 138.57, 155.56, 185, 207.65, 233.08, 4.9, 6, 9.19

Injury-related: 0.5, 1, 1.1 + 73, 1.2 + 250, 10.5, 20, 20.5, 5.8, 10, 20, 35, 40, 80, 125, 160, 240, 320, 324, 500, 528, 2720, 3K, 5K, 6K, 10K, 40K (for as long as desired)

PARASITES, PROTOZOA AND WORMS

The common dictionary definition of "parasite" is an organism that lives within or upon another organism at the expense of that organism. Many different harmful microbes, including bacteria and viruses, can be parasitic (feeding off a host); but in most cases, when people talk about "parasites," they are referring to protozoa and worms.

Protozoa are classified as one-celled animals contained within a membrane. They can propel themselves through fluid either by their flagella (tails), or by first extending some of their cellular material outward (creating a pseudopod,

Pesky Parasites Require Special Handling

Parasites are tenacious. They can be purged from one area of the body, only to migrate and proliferate in another. Dr. Jeff Sutherland writes:

To eliminate parasites requires the precise frequency for each stage of the parasite life cycle (at least four, often seven or more). . . . Also, killing one parasite, or one strain of a parasite allows other strains to proliferate. And killing a parasite infected with another parasite, virus, bacteria, etc., releases those pathogens into your system.

. . . So usually, I figure out what the parasite are infected with and kill that first. Then shoot the parasite in all its stages. Then watch for what starts to proliferate and kill that. While herbal protocols will usually clean out your digestive tract, the parasites will often move to other parts of your body, particularly the brain and sometimes veins which can cause blood pressure and high pulse. Athlete's foot parasites seem to have a particular affinity for the brain, maybe one of the factors in the "jock" personality type. So you really want to use frequency devices that provide a whole body effect. The right herbs are a good adjuvant therapy to keep the body loading down while you eliminate the stragglers with Rife Therapy.

Finally, a parasite may hole up in a very specific organ or portion of an organ . . . So you need to have a means of detecting where in the body a specific parasite is hiding, figuring out what it is infected with, determining the stages of its life cycle and the specific frequencies for those stages, along with slightly different frequencies for different strains of the same parasite.

It's a daunting task. As a result, most people do not get consistent results with Rife frequencies for parasites without some expert assistance.³⁰

By the way, many people who are asymptomatic and don't feel especially bad might be surprised to discover that they harbor parasites. Everyone hosts some pathogenic microorganisms; but in healthy people, these microbes exist in small numbers. When the immune cells aren't functioning well and the terrain is dirty, the microbes proliferate.

or literally "false foot"), and then dragging the rest of their body to meet this "foot." Sometimes they are simply moved through the medium in which they land. Amoebas and paramecia are familiar protozoa. Protozoa reproduce through fission—splitting into two or more identical parts. Parasitic worms are much more complex, and generally are large enough to be seen without a microscope. Although worms do not have skeletal structures, they do possess excretory, nervous, and reproductive systems. They can grow inside the human body to lengths of 11 feet or more. Because of their sophistication and potential for becoming so huge, worms can cause severe damage. They are divided into three major groups: roundworms (also called nematodes), tapeworms (also called cestodes), and flukes (also called trematodes). There are many subgroups within these three major groups, and the worms have varied physical features.

Over 134 parasites can live in the human body. In fact, reviews of autopsies show that parasites may contribute to as much as 75% of all illness, although ordinary diagnostic tests may not detect the presence of worms and parasites due to a sampling error. While a favorite place for parasites to inhabit is the gut, many of them also live in the pancreas, liver, kidneys, brain, and blood.

Conventional tests for parasites are inadequate. Tests that utilize fecal smears to detect intestinal parasites are often unable to find them because once the worms attach to the mucous membranes, they become deeply lodged in the crevices and pockets of the large intestine wall, and avoid being expelled or seen if the layers of waste are tightly impacted. As for other types of parasite tests, according to many lab technicians even mucosal swabs and UV (ultraviolet) stains are limited because they cannot detect the worms in all of their forms—eggs, immature larvae, and adults.

Parasite infestations cause a dizzying array of symptoms. Some of the most common symptoms relate to the digestive tract: nausea, vomiting, constipation, diarrhea, anal itching, extreme weight loss or gain, intestinal cramping, blood in the feces, malnutrition (especially due to the malabsorption of fats), joint and muscle pain, food cravings, and constant hunger. In the genital and urinary tracts, parasitic infection can manifest as vaginal discharge and burning on urination. The skin might be burdened with rashes, hives, itching, and even eczema or rosacea. Other symptoms include coughing, fever, night/day sweats, chills, respiratory congestion, and central nervous system impairment that includes headache, disrupted sleep and difficulty falling asleep, iron-deficiency anemia, blurry vision, and even blindness. When international travelers contract "traveler's diarrhea," they almost always have parasites. People with a history of food poisoning who are still dealing with digestive issues should check for parasites. Also, people who grind their teeth while sleeping may have parasites! Almost any symptom is possible, based on what parasite is present and where it is in the body.

Parasites migrate. They are difficult to eliminate because of their many life cycles; see Sidebar, "To Kill Parasites, Always Use Herbs Too."

It's wise to routinely treat for *Candida* while treating for parasites, for there is a tremendous overlap between the two symptom pictures. Where there's *Candida*, you'll often find protozoa and worms, and vice-versa. In addition to the frequencies, you'll probably need to take herbal remedies—not only to help kill the parasites, but also to repair the damage done to the body by the parasites.

Important! Viruses often live inside bacteria, and bacteria often live inside worms. So even if the worms are killed, you must still deal with the smaller pathogens that play a role in the composite worm/bacteria/virus symptom picture. See listings for other pathogens. Also see **CHEMICAL SENSITIVITY / POISONING**, because heavy metals are often present when parasites have infected the body.

General (unspecified)

3 + 230, 9.6, 20, 35, 47, 60, 64, 72, 80, 95, 96, 102, 112, 120, 125, 128, 152, 240, 334, 422, 440, 444 + 1865, 465, 524, 590, 624, 642, 644, 660 + 690 + 727, 651, 665, 676, 688, 712, 732, 740, 751, 770, 780, 784, 787, 800, 802 + 1550, 854, 880, 1552, 1840, 1862, 1864, 1885, 1998, 2112, 2322, 3176, 4125, 4412, 5K, 10K

Common Single-Celled Parasite (unspecified)

432, 660 + 690 + 727, 753

Acanthamoeba castellanii / *Acanthamoeba Keratitis*

This amoeba, which lives in soil, water and air, causes *Acanthamoeba Keratitis*, an infection of the cornea (the transparent outer covering of the eye), which may result in permanent visual impairment or blindness. Contact lens wearers are at risk, as well as swimmers in polluted water. Experimental: 6242044.4544

Amoebas

310, 333 + 523 + 768 + 786, 532, 732, 827, 1522

Ancylostoma caninum

This worm has very nasty hooks that can grow to five inches in length. It causes anemia, heart conditions, severe infections in the respiratory, genital and urinary tracts, and hypoproteinemia (abnormally low levels of protein in the blood). This worm is common in tropical and subtropical regions—northern Africa, northern India, northern parts of the Far East, and the Andean region of South America—that have inadequate sewage disposal.

From Dr. Marty Monahan: 5050, 6187, 6468

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 383100 (lowest), 386K, 393K and 400K (optimal), 402900 (highest).

Hz set: 949.61 (lowest), 956.80, 974.15 and 991.50 (optimal), and 998.69 (highest).

Whether using the KHz or Hz set, use all the frequencies because this microorganism can be difficult to eradicate.

To Kill Parasites, Always Use Herbs Too

The following herbs have many other benefits besides those related to parasites. Below is a brief summary strictly related to parasites, protozoa, and worms.

- ◆ **Black Walnut Hulls** (green, sometimes the leaves). Kills adult parasites. Mandatory in most formulas.
- ◆ **Clove Bud.** Dissolves some parasites and their eggs. Mandatory in most formulas.
- ◆ **Fennel Seed.** Mildly laxative to humans and irritating to some parasites. Helps remove their wastes.
- ◆ **Male Fern Root.** Immobilizes parasites, preventing them and their eggs from adhering to intestinal tract walls. Highly effective. Mandatory in all good formulas, but toxic in excess.
- ◆ ***Mimosa pudica* leaves.** Ayurvedic herb from India reported to be thirty times more powerful than pharmaceuticals.
- ◆ **Sage Leaves.** Contains relatively high levels of thujone, the same ingredient in wormwood that kills parasites.
- ◆ **Senna Pods, Seeds, and Leaves.** A powerful laxative that should not be used long-term, senna is used in conjunction with other parasite-killing herbs because it promotes peristaltic action that helps expel the parasites. Senna also repels worms.
- ◆ **Tansy Leaves.** Highly toxic to worms, it's used to both repel and expel parasites. In excessive amounts, it may cause spasms, convulsions, and hallucinations in humans.
- ◆ **Thyme Leaves.** Toxic to hookworms, roundworms, threadworms, and skin parasites.
- ◆ **Wormwood Leaves and Flowers.** Kills roundworms, hookworms, whipworms, pinworms, and their larvae. Mandatory in almost all formulas.

Also from Clark: 19914.83, 19566.32, 19217.81

Ascaris lumbricoides / Roundworm

One of the largest and most common parasites found in humans, particularly the lungs where it causes hemorrhaging, inflammation, and edema. These worms migrate throughout the body, blocking passageways, ducts, and blood vessels. Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Candida albicans*," because *Ascaris* and *Candida* often co-exist.

First try: 650, 771 (both from Dr. John Garvey), 600 + 625 + 650

Also try (many from Michael Tigchelaar): 20, 104, 112, 120, 128, 240, 332, 422, 543, 688, 721, 732, 771, 772, 827, 835, 942, 1500, 3212, 4412, 4152, 5897, 7159

Experimental (from Dr. Richard Loyd): 1011.33, 471910.2143, 4777.5565, 55455.4555, 7456.5499

Ascaris, Other Types (unspecified)

From Richard Loyd: 152, 442, 707, 751, 797, 1146, 8146

Ascaris, unspecified, larvae in lungs

From Dr. Hulda Clark: 20313.12, 1011.33

Babesia / Babesiosis

Babesiosis is an infection caused by any of three *Babesia* protozoa that are transmitted by bites from deer ticks and other insects. This disease infects humans, dogs, rodents and cattle, and often accompanies Lyme disease in humans. Symptoms may include chills, pain in bones and muscles, nausea, vomiting, kidney and heart malfunction, depression, and “air hunger”—the feeling that one cannot draw in enough oxygen, no matter how hard one breathes. *Babesia* is well known for affecting the nervous system and hormones. This protozoan feeds on the iron-rich hemoglobin in the blood, so iron deficiency anemia is common. Symptoms of anemia include fatigue, weakness, shortness of breath, dizziness, tingling in the limbs, swelling of the tongue, cold hands and feet, rapid or irregular heartbeat, brittle nails, and headache—which is one reason that *Babesia* infections do so much damage.

Lyme experts Steven Buhner and Richard Horowitz recommend the herb *Cryptolepis sanguinoleta* to help eliminate *Babesia*. Berberine, an alkaloid compound found in several different plants (including goldenseal, goldthread, European barberry and Oregon grape), is another herb that some have found helpful. The herb cat’s claw (*Uncaria tomentosa*), so effective for Lyme, is also used to help repair the nerve, immune, and hormonal damage caused by *Babesia*. *Mimosa pudica* (“sensitive mimosa” plant) is also very effective in managing both the *Babesia* and the biofilms that it produces.

Because Babesiosis often occurs with other similar illnesses that are carried by the same insects, also see, all under **BACTERIA**, “*Ehrlichia chaffeensis* / Ehrlichiosis,” “*Rickettsia rickettsii* / Rocky Mountain Spotted Fever,” and “*Borrelia*, all types / Borreliosis / Lyme Disease.”

The frequencies are combined for *Babesia microti*, *Babesia gibsoni*, and *Babesia divergens*.

76, 432, 570, 646, 753, 1583, 1584, 5776

Specified for a Doug Coil machine, these frequencies might work on other equipment: 570, 1583

Also try: 6777555.5655 and 6777555.5555 (alternate between the two, 10 seconds each, for as long as desired)

Blastocystis hominis / Blastocystosis

The one-celled intestinal parasite *Blastocystis hominis*, often found in colitis or Irritable Bowel Syndrome, causes Blastocystosis. Symptoms include acute diarrhea and abdominal pain. Also see “*Dientamoeba fragilis*” and “Pinworm / Seatworm / *Enterobius vermicularis*” in this section; they often appear together.

First try (from Dr. John Garvey): 848, 365, 844, 595

Also try: 1201, 1243, 5777, 11425, 11841, 11967, 13145, 13469, 21776

Blastocystis dermatitidis: 1233**Blepharisma japonicum and Blepharisma undulans**

Protozoa that may eat bacteria in decomposing vegetation. 3120

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 405650 (lowest), 406500 (optimal), and 407450 (highest)

Hz set: 1005.51 (lowest), 1007.61 (optimal), and 1009.97 (highest)

Brain Parasite

See “*Naegleria fowleri* / Brain Parasite” in this section.

Clonorchis sinensis / Oriental Liver Fluke

Transmitted through the eating of raw fish, it lodges in the liver bile ducts of humans, dogs, cats, pigs and rodents, causing the duct lining to thicken and the surrounding liver tissue to become inflamed. This nasty parasite grows up to 10 inches long and is estimated to infect about 30 million people in Japan, Korea, China, Taiwan, and Vietnam.

2K

From Dr. Hulda Clark: 21259.08, 1058.43

Cryptosporidium parvum / Cryptosporidiosis

Cryptosporidiosis is an infection caused by the protozoan *Cryptosporidium parvum*. In a healthy individual, it can cause acute diarrhea. It mainly affects children and can be the cause of recurrent diarrhea, but can also cause severe, chronic diarrhea in people with AIDS.

From Dr. John Garvey: 482, 4122

Also try: 660 + 690 + 727, 432, 753, 5776

Dientamoeba fragilis

A parasite that lives in the large intestine of humans, possibly related to *Trichomonas*. Many people are asymptomatic. When symptoms do occur, they include diarrhea, nausea, stomach pain and cramps, loss of appetite and weight, and fatigue. Children age 5 to 10 are most commonly affected.

The infection, common worldwide, presumably remains in the intestine without spreading to other parts of the body. More than one stool sample may be needed to detect the parasite. It is spread through improper sanitation and contaminated water and food, so wash hands after using the toilet.

Pinworm eggs can protect *Dientamoeba fragilis*, so the two are often found together. Therefore, also see “*Enterobius vermicularis* / Pinworm / Seatworm” in this section.

676 (from Dr. Loyd), 1001.42, 20113.98

***Dirofilaria immitis* / Dirofilariasis / Heartworm**

Dirofilaria immitis, carried by several types of mosquitoes, causes Dirofilariasis or heartworm, which affects dogs. Symptoms include coughing, fatigue, weakness, fainting, fever, chills, muscle aches, difficulty breathing, heart pain, irregular heartbeat, heart failure, and eventually death. Once a carrier mosquito bites a dog, the immature larvae enter the bloodstream, remain in the tissue surrounding the bite for about two months, and then enter the bloodstream as worms. It takes three to four months to reach the heart and nearby arteries, where they can grow as long as 11 inches and literally strangle the heart muscle.

The most popular test for heartworm—searching a blood sample for microfilaria—is inconclusive because as many as 38% of infected dogs don't have microfilaria circulating in the bloodstream at the time the test is done. Newer tests, which look for chemical substances produced by adult heartworms, are less commonly done.

Heartworm drugs contain highly toxic arsenic compounds that cause headaches, weakness, joint pains, nausea, vomiting, and even death. According to the American Veterinary Medical Association, 65% of adverse drug reactions, and almost half of all drug-related deaths in dogs, are caused by heartworm prevention medication. The best natural prevention for your dog is a diet of raw meat, vegetables, nutritional yeast, and a bit of fresh garlic. Essential oils like eucalyptus (diluted for your dog's very sensitive nose) make good natural insecticides. Synthetic chemicals are poisonous. For more information, read holistic pet care classics by C.J. Puotinen, Wendy Volhard, and Juliette de Bairacli Levy.

543, 2322 (first two from Dr. John Garvey), 200, 535, 685, 799, 1077

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 408150 (lowest), 409K (optimal), and 411150 (highest)

Hz set: 1011.70 (lowest), 1013.81 (optimal), and 1019.14 (highest)

Also from Clark: 20362.91, 1013.81

***Echinococcus granulosus* (Tapeworm)**

See "Tapeworm" in this section.

Entamoeba gingivalis

Highly contagious, with gum inflammation and infection. From Dr. Richard Loyd: 477

***Entamoeba histolytica* / Amoebic Dysentery**

Entamoeba histolytica is a dangerous protozoan that causes amoebic dysentery, infecting the liver and the digestive tract. Symptoms include severe diarrhea, ulcerated open wound, fever, and blood in the stool. As several common pathogens can cause similar symptoms, also see **BACTERIA**, "*Salmonella typhi* / Typhoid Fever" and "*Shigella*."

**Spectro-Chrome Color Therapy
Works Remarkably Well for Parasites**

Spectro-Chrome Color Therapy (developed a century ago) is a deceptively simple, but highly effective protocol to eliminate parasites. In fact, it may work better than Rife frequencies. Spectro-Chrome was even successfully used by a doctor in a hospital before the FDA pushed it underground. For under one hundred dollars, you can use this elegant protocol that does not require electricity or expensive equipment. See Chapter 3 for details.

First try (from Dr. Garvey): 148, 166, 308, 393, 631, 778

From Dr. Hulda Clark: 19168.02, 954.32

Then try: 333 + 523 + 768 + 786, 465, 660 + 690 + 727, 787, 802 + 1550, 832, 880, 1552 for accompanying infections.

***Enterobius vermicularis* / Pinworm / Seatworm**

Highly contagious infection in intestinal tract, mostly in young children. Symptoms include itching, pain, and rash in anal area. Also see "*Dientamoeba fragilis*" in this section. 20, 112, 120, 422, 423, 732, 773, 826, 827, 835, 4152, 4412

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 420950 (lowest), 423K (optimal), and 425300 (highest)

Hz set: 1043.43 (lowest), 1048.51 (optimal), and 1054.21 (highest)

Also from Clark: 21059.93

Euglena

A protozoan somewhat related to algae.

432, 3215, 3225, 3325, 6448

***Eurytrema pancreaticum* / Pancreatic Fluke**

A flat worm that lives in the pancreatic ducts of humans, pigs, cattle, camels and monkeys, and may cause diabetes due to the extensive tissue damage it creates when it burrows into the pancreas. Also see **BLOOD SUGAR PROBLEMS** to deal with the damage to the pancreas.

1850, 2K, 2003, 2008, 2013, 2050, 2080, 6578, 1043.55, 20960.36

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 420350 (lowest), 421K (optimal), and 422300 (highest)

Hz set: 1041.94 (lowest), 1043.55 (optimal), and 1046.78 (highest)

Also from Clark: 20960.36

***Fasciola hepatica* / Liver Fluke / Sheep Liver Fluke**

Infecting humans and cattle as well as sheep, these parasites are transmitted by ingesting contaminated vegetation. They lodge in the liver bile ducts, thickening the duct lining and inflaming the surrounding liver tissue. They are found throughout the United States, England, Ireland, Europe, the Middle East, Far East, Africa, and Australia. Also see “Fluke, Liver (unspecified)” in this section.

275 (from Dr. Garvey), 14, 826, 830, 834

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

Adult fluke

KHz set: 421350 (lowest), 425K (optimal), and 427300 (highest)

Hz set: 1044.42 (lowest), 1053.47 (optimal), and 1059.17 (highest)

Larval stage

KHz set: 423800 (lowest), 427K (optimal), and 430600 (highest)

Hz set: 1050.50 (lowest), 1058.43 (optimal), and 1067.35 (highest)

Fluke eggs:

KHz set: 422K (lowest), 425K (optimal), and 427600 (highest)

Hz set: 1046.03 (lowest), 1053.47 (optimal), and 1059.91 (highest)

Also from Clark: 21159.50 (eggs) and 21259.08 (larvae)

***Fasciolopsis buski* / Intestinal Fluke**

A type of flat worm implicated in intestinal cancer and ulcers. Also see “Fluke, Intestinal, including *Fasciolopsis buski*” in this section; “Intestinal Cancer” under **CANCER**; and **ULCERS**.

55, 2K

From Dr. Hulda Clark: 21607.59, 1075.78 (adults and eggs); 21508.01, 1070.82 (larvae); 15 (eggs)

Filaria

A subgroup of nematodes, found in the blood and organs of mammals and transmitted from biting insects.

112, 120, 332, 753

Fluke, Blood

See “*Schistosoma mansoni*” and “*Schistosoma haematobium*” in this section.

Fluke, Cat Liver

See “*Opisthorchis felinus*” in this section.

Fluke, General

Flat worm found in the liver, intestines and other areas.

First try: 15, 55, 143, 275, 435, 524, 651, 664, 676, 763, 854, 945, 2K, 6766, 15244

Also try: 15, 55, 524, 854, 2K

Fluke, Intestinal, including Fasciolopsis buski

Appearing in the liver and other places, and implicated in intestinal cancer and ulcers. Also see “Intestinal Cancer” under **CANCER**; and **ULCERS**.

15, 55, 143, 524, 651, 676, 844, 848, 854, 2K, 2084, 2128, 2150, 6766

From Dr. Hulda Clark: 21607.59, 1075.78 (adult and eggs), and 21508.01, 1070.82 (larvae)

Fluke, Liver, Oriental

See “*Clonorchis sinensis* / Oriental Liver Fluke” in this section.

Fluke, Liver (unspecified)

Also see “*Fasciola hepatica* / Liver Fluke / Sheep Liver Fluke” and “*Clonorchis sinensis* / Oriental Liver Fluke” in this section.

143, 238, 275, 676, 763, 6641, 6672

Fluke, Lymph

157, 10050

Fluke, Pancreatic

See “*Eurytrema pancreaticum* / Pancreatic Fluke” in this section.

Fluke, Sheep Liver

See “*Fasciola hepatica* / Liver Fluke / Sheep Liver Fluke” in this section.

***Funis vermis* / Homo Funis vermis / Ropeworm**

Also known as human ropeworm. Found in the intestinal tract and sometimes elsewhere in the body, it's slimy and anaerobic. In some of its stages it looks like a rope and can be over a foot (or meter) long; in other stages, it resembles a branched jellyfish. Reaching its fifth (most mature) stage of development can take 10 years. In 2013 at the International Chronic Disease conference, doctors Alex A. Volinsky and Nikolai V. Gubarev described this newly discovered, uncatalogued parasite that attaches to the large intestine via suction cups it produces, and is erroneously mistaken for intestinal lining, feces, or the decayed remains of food or other parasites.

There's considerable debate in both the conventional and holistic medical communities as to whether a ropeworm is an actual parasite. Because ropeworms were initially found expelled from the bodies of people who did enemas, some doctors hypothesized that the material was biofilms, an overabundance of mucus, or even debris from a *Candida albicans* infection. However, human DNA has been discovered in these rope-like structures, so it's quite possible that these worms are a new life form—the byproduct of genetically modified organisms (GMOs) found in food, combined with human intestinal cells and various species of bacteria.

People harboring these parasites experience gas and bloating, indigestion, headaches, heightened allergies, back pain, and susceptibility to other illnesses. According to Volinsky and Gubarev, the best way to eliminate these worms is by drinking fresh vegetable juices, taking large amounts of Vitamin C, and doing coffee enemas (see Chapter 3, **Detoxification**). Some people have also reported success with 8–10 days of eucalyptus tea enemas. They use the following recipe: For 15 minutes, boil a little over 1 ounce (30 gm) of eucalyptus leaves in 1 quart (1 liter) of water, cover and steep for 2–3 hours, reheat to a tolerably warm temperature, and just before doing the enema add 15–30 drops of eucalyptus essential oil to the solution. Hold the fluid for at least 15 minutes. When the fluid is gone, do another enema with about 7 ounces (200 ml) of lemon juice, followed by a third enema of 2 quarts (liters) of warm water. It's advised to do all enemas between 1 am and 2 am, when the parasites are most active. Avoid sugars and genetically engineered foods.

People suffering from Lyme, autism and Morgellons are reporting the presence of ropeworms in their bodies. Despite the debate about whether this creature exists, some rifers diagnosed with this condition used the following frequencies from Dr. Richard Loyd, passed what appeared to be worms, and got well.

1359 and (for some) 1360

Less tested: 40, 70, 150, 339.875, 550, 1359.5, 2230, 4210, 13980, 90510, 350K, 432140

***Giardia duodenalis* / Giardiasis**

The one-celled *Giardia duodenalis* lives in the intestines of animals and people worldwide, causing giardiasis, a common water-borne illnesses. Common symptoms include abdominal cramps, nausea, and watery diarrhea. There are many strains of the *Giardia* microorganism but no publicly known frequencies for *Giardia duodenalis*. Get them at dnafrequencies.com. Also try *Giardia lamblia*.

***Giardia lamblia* / *Giardia intestinalis* / Giardiasis**

This protozoan found in the intestinal tract is the most frequent cause of non-bacterial diarrhea in North America. Infection is usually caused by drinking contaminated water or eating produce washed in contaminated water. Watery diarrhea usually occurs within a week of ingestion. Other symptoms include intestinal cramping, nausea, gas, and weight loss. Most susceptible are children and those with weak immunity. Disease normally lasts one to two weeks, although chronic infections may last months or even years.

Giardia survives best in a cool moist environment. Several strains have been found, causing more or less severe symptoms depending on the person's constitution. 334, 407, 812, 829, 1K, 2018, 4334, 5429

These frequencies are from Jeff Sutherland.:

adults 430531; *larvae* 231350; *eggs* 110110

Dr. Sutherland emphasizes that the following frequencies must be used in the following sequence: 430531, 231350, 110110, 231350, 430531, to ensure that the life cycle of the parasite is completely disrupted and all stages are caught and destroyed. A sweep of 200–300 Hz is recommended to accommodate the individuality of the terrain.

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 421400 (lowest), 424K (optimal), and 426300 (highest)

Hz set: 1044.55 (lowest), 1050.99 (optimal), and 1056.69 (highest)

Also from Clark: 21109.72

Heartworm

See "*Dirofilaria immitis* / Dirofilariasis / Heartworm" in this section.

Hookworm, probably *Necator americanus*

Also see "*Ascaris lumbricoides* / Roundworm" in this section. 6.8, 440, 2008, 5868, 6436

***Leishmania*, all types**

Transmitted by sandflies, *Leishmania* (protozoa with tails) cause Kala-azar and similar diseases that infect the lymph nodes, liver, and spleen. Symptoms include fever, enlarged spleen, anemia, emaciation, and sometimes skin ulcers, and boils in the nasal cavities and throat. *Tabor's Cyclopedic Medical Dictionary* (copyright 1940) recommends whole blood transfusions and ultraviolet radiation as a treatment. In progressive clinics outside the US, blood is slowly taken outside the body in increments, treated with ultraviolet light to kill the pathogens, and then returned to the body.

This disease originated in the tropics, but it's now global. Depending on the geographical variations in which the protozoa develop, they are all slightly different and cause slight variations in symptoms. Try all the frequencies.

Leishmania braziliensis

787

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 400050 (lowest), 403K (optimal), and 405100 (highest)

Hz set: 991.62 (lowest), 998.94 (optimal), and 1004.14 (highest)

Also from Clark: 20064.19

**Always use 40K for additional benefit.
It brings vitality to the cells.**

Leishmania donovani

525, 781

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 398K (lowest), 400K (optimal), and 402650 (highest)

Hz set: 986.54 (lowest), 991.50 (optimal), and 998.07 (highest)

Also from Clark: 19914.83

Leishmania mexicana

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 400200 (lowest), 402K (optimal), and 403800 (highest)

Hz set: 992 (lowest), 996.46 (optimal), and 1000.92 (highest)

Also from Clark: 20014.40

Leishmania tropica

791

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 402100 (lowest), 405K (optimal), and 407400 (highest)

Hz set: 996.71 (lowest), 1003.89 (optimal), and 1009.84 (highest)

Also from Clark: 20163.76

Leishmania Virus

The *Leishmania* virus is included here because researchers believe that it inhabits the *Leishmania* protozoan and contributes to its pathogenic effects.

"New World" *Leishmania* Virus

428.3, 856.6, 1713.1

"Old World" *Leishmania* Virus

431.8, 863.6, 1727.2

Malaria parasite

See "*Plasmodium falciparum*" in this section.

***Naegleria fowleri* / Brain Parasite**

An amoeba found in soil, water and air that enters through the nasal passages into the brain, causing encephalitis and death in one week if not treated. There are fewer than 100 reported infections in 25 years in the US. People may contract this amoeba when swimming or when using faulty equipment to make saline solutions to clean their contact lenses, ending up with contaminated solution.

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 356900 (lowest), 362K (optimal), and 364350 (highest)

Hz set: 884.67 (lowest), 897.31 (optimal), and 903.13 (highest)

Also from Clark: 18022.92

Nematodes

See "*Ascaris lumbricoides* / Roundworm" in this section.

***Opisthorchis felineus* / Cat Liver Fluke**

Affects the bile duct, small intestine, pancreatic duct and liver of mainly outdoor and feral cats who eat infected snails, lizards, frogs, or fish. Symptoms include diarrhea, vomiting, distended abdomen, jaundice, fatigue.

From Dr. Richard Loyd: 256

Paramecium caudatum

Paramecium with a tail.

1150, 2298, 4500

Pinworm

See "*Enterobius vermicularis* / Pinworm / Seatworm" in this section.

***Plasmodium falciparum* / Malaria Parasite**

Inside mosquitoes that transmits malaria when the host gets bitten, the parasite circulates throughout the body, infecting the liver and bursting red blood cells. Symptoms include fever, anemia, spleen enlargement, and usually death. If *Plasmodium* becomes lodged in a capillary in the brain and blocks circulation, the subject suffers a seizure and dies within three days. In tropical countries, millions of people each year contract malaria and hundreds of thousands die. At least half of malaria sufferers are infected with *Plasmodium falciparum*. (*Plasmodium vivax* infects bone marrow and remains undetected for years.)

For centuries, the Chinese have successfully used the herb wormwood (*Artemisia absinthium*). It's soaked in water overnight and the water is drunk the next morning. Wormwood, activated by the presence of iron, releases free radicals that destroy the parasite's cell membranes. (The red blood cells inhabited by the parasite are rich in iron.) The drug Artemisinin® is derived from *Artemisia annua*, or sweet wormwood.

New research finds a 34% decrease in malaria in children who receive Vitamin A and zinc supplementation. Try all frequencies below for at least 6 minutes each.

222, 550, 713, 930, 1032, 1433 (all from Dr. John Garvey), 20, 455, 555, 743, 1002, 1019, 1348, 1473, 1518

Pneumocystis carinii

In people with weakened immunity, this tiny protozoan can cause fever, fatigue, and weight loss—and then, weeks later, life-threatening pneumonia, which fills the infected and inflamed lungs with copious amounts of fluid and mucus. Symptoms of the pneumonia include dry cough, chills, high fever, chest tightness, and difficulty breathing. As with so many pathogens, this protozoan lives in the body but does not cause problems until the terrain is favorable to its growth. Many people who take recreational drugs or test positive for HIV develop pneumonia from this parasite. An untreated infection can seriously impair the lungs' ability to transport oxygen into the blood, which can lead to death.

This parasite can also infect the eyes, ears, skin, liver and other organs. Also see **BACTERIA**, "*Klebsiella pneumoniae* / Pneumonia" and "*Mycoplasma pneumoniae* / Pneumonia"; and **RESPIRATORY TRACT, Lungs**, "Pneumonia / Bronchial Pneumonia."

First try: 340, 742 (from Dr. John Garvey), 204, 600 + 625 + 650, 660 + 690 + 727, 709.2, 2838.5

Then try: 20, 412, 450, 452, 550, 578, 688, 683, 766, 776, 787, 802 + 1550, 880, 975, 1238, 1474, 1862, 2688

Protomyxzoa rheumatica

Recently discovered by Fry Labs of Scottsdale, Arizona, in the US, the pathogen was believed to be a parasite, perhaps because it appears in so many mosquitoes and even ticks. However, in 2017, a research paper published in Medical Archives discussed new DNA sequencing tests showing that this pathogen is a fungus. See "*Funnelformis mosseae*" (the new name) under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

Protozoa, general

432, 753, 5776

Rotifer

Parasites that live in both fresh and salt water.

4500

From Hulda Clark: 1151K or 2853.04 (for units unable to reach the KHz range)

Ropeworm

See "*Funis vermis* / *Homo Funis vermis* / Ropeworm" in this section.

Roundworm

See "*Ascaris lumbricoides* / Roundworm" in this section.

Roundworms, in Dogs and Cats

See "*Toxocara canis* / Toxocariasis" in this section.

***Schistosoma* / Schistosomiasis / Snail Fever**

This blood fluke, found in snails, infects via contaminated water: drinking it, washing vegetables in it, eating seafood caught in it, and bathing in it. Just 10 seconds of contact can cause serious illness and even death. The fluke attacks the liver, pancreas, and stomach. Symptoms include nausea, chills, sweats, muscle and joint aches, unremitting fatigue, fever, distended abdomen, and a painful enlarged liver. Sometimes the illness can take eight years or longer to progress. Wild animals are affected as well as humans.

The three main species of these trematode parasites infect over 200 million people in about 75 tropical and subtropical countries. This is the most prevalent tropical disease besides malaria. Thousands of people die from this fluke in China and Japan, where sushi (raw fish) is often eaten. However, this is also a disease and chronic problem of impoverished people who must use contaminated lakes and rivers for all of their water needs. Chinese medicine uses bitter herbs to stimulate the liver to produce more bile, theorizing that the bile and not the herbs kill the fluke. This is tough to treat; strong drugs are usually used. Consider herbs suggested for other parasites, but also consult an experienced herbalist if you want to treat by natural means. See the article, "Natural Products as Therapeutic Agents for Schistosomiasis."³¹

Schistosoma haematobium

Typically causes chronic inflammation of the urinary-genital tract and is implicated in cancers of the bladder and cervix.

847 (from Dr. John Garvey), 589, 635, 867

From Dr. Hulda Clark: 473K or 1172.45 (for units unable to reach the KHz range) and 23549.28

Schistosoma japonicum

Causes conditions similar to those created by *Schistosoma mansoni*.

1015.99, 1076.83, 1093.47, 1236.71, 1272.84, 1286.85, 1378.98, 1428.54, 1577.76, 1759.05, 1778.38, 1863.21

Schistosoma mansoni

Typically causes symptoms similar to Hepatitis C. Also involved in cancers of the liver, colon and lymph.

329 (Dr. Garvey), 9889, 1035.49, 1087.17, 1089.26, 1238.74, 1257.39, 1261.50, 1272.84, 1350.21, 1431.24, 1564.68, 1734.81, 1799.57, 1910.34

From Dr. Hulda Clark: 353K or 875 (for units unable to reach the KHz range)

Schistosoma mekongi

1013.26, 1076.83, 1087.17, 1228.66, 1277.15, 1288.04, 1331.18, 1373.96, 1423.15, 1564.68, 1622.97, 1742.81, 1782.58

Seatworm

See “*Enterobius vermicularis* / Pinworm / Seatworm” in this section.

Sheep Liver Fluke

See “*Fasciola hepatica* / Liver Fluke / Sheep Liver Fluke” in this section.

Snail Fever

See “*Schistosoma* / Schistosomiasis / Snail Fever” in this section.

***Strongyloides stercoralis* / Threadworm**

This 2.5 mm-long roundworm lives in southern US, the tropics, and Asia. Skin becomes red and pruritic after the larvae penetrate, usually on the feet. Diarrhea, vomiting, and abdominal pain may follow. Migration of larvae to lungs can result in cough and pneumonia.

From Dr. John Garvey: 423, 732, 4412

Also try: 9.6, 332, 422, 721, 749, 942, 3212

Larval stage

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 398400 (lowest), 400K (optimal), and 402K (highest)

Hz set: 987.53 (lowest), 991.50 (optimal), and 996.46 (highest)

Also from Clark for the larval stage: 19914.83

Also try: 380, 698, 722, 738, 746, 752, 776, 1113

Tapeworm

Found primarily in dogs, and also cats, wolves, sheep, cattle, goats, horses, pigs, rodents, and humans. It can create tumors the size of golf balls and even larger, usually in the liver but sometimes in the lungs and brain as well.

Tapeworm Frequencies from Dr. Hulda Clark

Dr. Clark advised using a gated square wave (not the sine wave) when rifting for tapeworms. Sweep from the lower range to the upper range. The tapeworm must be zapped from the lowest segment (and lowest frequency) to the head (scolex) and highest frequency to prevent the middle segments from regenerating. Include all egg and larva frequencies.

Use the Hz range for devices unable to output frequencies in the KHz range.

Tapeworm	Kilohertz Range		Hertz Range	
<i>Taenia</i> family, unspecified, larvae	436400	440050	1081.73	1090.77
<i>Diphyllobothrium erinacei</i> , head	467250	487550	1158.20	1208.52
<i>Diphyllobothrium latum</i> , head	452900	472300	1122.63	1170.71
<i>Dipylidium caninum</i> , male/female sex organs	439550	444300	1089.54	1101.31
<i>Dipylidium caninum</i> , head	451950	472150	1120.27	1170.34
<i>Echinococcus granulosus</i> , larvae	441150	446500	1093.50	1106.76
<i>Echinococcus granulosus</i>	451600	461500	1119.40	1143.94
<i>Echinococcus multilocularis</i>	455850	458350	1129.94	1136.14
<i>Hymenolepis nana</i> , larvae	478000	481750	1184.84	1194.14
<i>Hymenolepis diminuta</i>	445000	481150	1103.04	1192.65
<i>Moniezia</i>	430350	465200	1066.73	1153.12
<i>Taenia serialis</i>	453600	457800	1124.36	1134.77
<i>Taenia pisiformis</i> , eggs	465200	469700	1153.12	1164.27
<i>Taenia pisiformis</i> , larvae	475200	482100	1177.90	1195.01
<i>Taenia saginata</i> , larvae	476500	481050	1181.13	1192.40
<i>Taenia solium</i> , larvae*	475000	475000	1177.41	1177.41
<i>Taenia solium</i> , head*	444000	448900	1100.57	1112.71

*Because Dr. Clark states that the head of the tapeworm has the highest frequencies, the numbers for the *Taenia solium* larvae and head may have been inadvertently transposed in Clark's original work.

Tapeworms grow in pieces or segments. Most of the time, tapeworms that are cut can regrow the portions that are missing. If the middle segment is killed first—instead of the bottom segment first, and then each adjacent segment sequentially—the separated tapeworm segments can regrow into completely new tapeworms. Also, once a live tapeworm is destroyed by the frequencies, its segments will release any eggs that are inside. Although the eggs are usually expelled with the worm segments by the digestive tract, they sometimes travel elsewhere in the body and hatch. This makes tapeworms difficult to kill. Therefore, antiparasitic supplements are mandatory. To help the body expel tapeworms, Dr. Hulda Clark recommended the following essential oil combination: coriander, dalmatian sage, thyme, cardamom, caraway seed, fennel seed, allspice, nutmeg, and juniper berry.

Science confirms a connection between tapeworms and cancer. The cyst, or sac containing the tapeworm larvae, causes a chronic inflammatory reaction in the organ that it invades, which then leads to the cyst being surrounded by fibrosarcomas.

Because there are so many species of tapeworms, and people usually don't know which kind they have, all tapeworm frequencies are together. Some are for *Echinococcus granulosus*, but there are frequencies for many others too. Whatever you do, don't rely on the frequencies alone!

First try (from Dr. John Garvey): 522, 562, 843, 1223, 3032, 5522

Then try: 142, 164, 187, 333 + 523 + 768 + 786, 410, 453, 542, 624, 662, 663, 803, 854, 1360, 5122

Taenia pisiformis

A hooked worm that infests the intestine of dogs, rabbits and other animals as well as humans. Humans who live with dogs should be careful not to touch their stool.

187 (from Dr. John Garvey), 444 + 1865

Threadworm

See "*Strongyloides stercoralis* / Threadworm" in this section.

***Toxocara canis* / Toxocariasis**

A common roundworm that lives in the small intestine of mammals, *Toxocara canis* affects humans as well as dogs. The disease we call "Toxocariasis" is the name for the infection caused by not only *Toxocara canis*, but also *Toxocara cati*, which infects cats. The infection from this species of worm has become a public health concern because livestock are also susceptible. Eating undercooked beef, lamb, chicken, rabbit, or duck (especially liver) may transport the worms or eggs. Adult dogs are usually asymptomatic, but puppies may experience intermittent vomiting and diarrhea, anemia, and coughing. Symptoms in humans may include fever, muscle ache, weight loss, cough, asthma, nausea or vomiting, or a rash.

Adult cats are usually asymptomatic, but kittens may experience weakness, apathy, appetite loss, diarrhea or constipation, blood in the stool, and (if there are many parasites), intestinal obstruction.

From Dr. Richard Loyd: 567 (dogs only)

***Toxoplasma gondii* / Toxoplasmosis**

This single-cell protozoan inhabits the small intestine of cats; but it can also infect other mammals, birds, reptiles and also humans, causing Toxoplasmosis. Symptoms include fever, abdominal pain, headache and sore throat, and sometimes lesions, hepatitis, pneumonia, and blindness. The pathogen can radically affect brain chemistry and hence a person's emotions, and has been linked to severe neurological disorders including depression, schizophrenia, and violent suicides. Toxoplasmosis infects one-third of all humans on earth.

This parasite is most commonly contracted by handling contaminated cat litter, so pregnant women should minimize contact with cats and avoid emptying their cat's litter box. The protozoan is also transmitted through organ transplants, blood transfusions, and from eating and drinking contaminated food and water. Easily transmitted by a pregnant woman to the fetus, it can cause spontaneous abortion, stillbirth, or mental and physical retardation.

First try (from Dr. John Garvey): 434, 852

From Dr. Hulda Clark: 395K or 979.11 (for units unable to reach the KHz range) and 19665.89

For secondary infections, try: 660 + 690 + 727

***Trichinella spiralis* / Trichinosis**

The infection Trichinosis is well known to cooks, as the parasite *Trichinella spiralis* is found in improperly cooked pork, rabbit, bear meat, and even beef. Symptoms, which can be serious, include diarrhea, fever, conjunctivitis, degeneration and pain in the muscles, and sometimes deterioration and nodules in the central nervous system.

541, 1372 (both from Dr. John Garvey), 101, 230, 822, 1054

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 403850 (lowest), 404500 (optimal), and 405570 (highest)

Hz set: 1001.04 (lowest), 1002.66 (optimal), and 1005.31 (highest)

Also from Clark: 20138.87

Trichomonas hominis

An intestinal protozoan parasite. Causes diarrhea and dysentery. The only *Trichomonas* frequencies publicly available are for those found in the genital tract, below.

610 + 692 + 980

Trichomonas vaginalis

An aerobic protozoan parasite usually found in the vagina, causing itching, burning, and foul-smelling discharge. It can be passed to a man during sexual intercourse.

From Dr. Marty Monahan: 155, 447, 448, 450, 962

Also try: 610 + 692 + 980

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 378K (lowest), 381K (optimal), and 383600 (highest)

Hz set: 936.97 (lowest), 944.40 (optimal), and 950.85 (highest)

Also from Clark: 18968.87

***Trichuris trichiura* / Whipworm**

This small worm with a whip-like shape is thought to infect fully one-quarter of the world's population, primarily in Asia but also in South America and Africa. Children can become infected by eating dirt. Symptoms can include diarrhea (especially at night) and dysentery.

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 388300 (lowest), 406K (optimal), 408900 (highest)

Hz set: 962.50 (lowest), 1006.37 (optimal), and 1013.56 (highest)

Also from Clark: 20213.55

***Trypanosoma brucei gambiense* / African trypanosomiasis / Sleeping Sickness**

Trypanosoma brucei gambiense, a genus of flagellate protozoan found in the blood and often transmitted by tsetse flies, causes African trypanosomiasis or Sleeping Sickness. Symptoms include fever, headache, inability to concentrate, lethargy, drowsiness, droopy eyelids and muscular weakness, and eventually tremors, seizures, coma, and death. Parasitologists used to think that there were two separate species of *Trypanosoma*: *Trypanosoma brucei* and *Trypanosoma gambiense*. However, it appears that there are only small variations in the different types of *Trypanosoma*, and the name "*Trypanosoma brucei gambiense*" is correct. This tropical disease can have an incubation time of up to two years. It causes extensive damage to the central nervous system and is always fatal if untreated. See a doctor if you have symptoms.

20, 120, 255, 316, 403, 656, 780, 700, 724, 988

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

423200 (lowest), 429K (optimal), and 431400 (highest)
393750 (lowest), 396K (optimal), and 398700 (highest)
423500 (lowest), 426K (optimal), and 428550 (highest)

Hz sets:

1049.01 (lowest), 1063.38 (optimal), and 1069.33 (highest)
976.01 (lowest), 981.59 (optimal), and 988.28 (highest)
1049.75 (lowest), 1055.95 (optimal), and 1062.27 (highest)

Also from Clark: 21358.65, 19715.68

PRIONS / AMYLOIDOSIS

Amyloidosis is caused by one or more of over thirty amyloid polypeptides (amino acids in chains) discovered by scientists. Amino acids that form proteins are assembled in chains of different lengths that are folded into various shapes. The amino acid composition, their position on the chain, and their shape all help determine the protein’s function. However, if the proteins are improperly folded and become misshapen, they cannot perform correctly.

In people with Alzheimer’s disease and dementia, amyloid beta (a specific amyloid protein) becomes fibrous and tangled, clumping in and around brain cells and forming plaque that kills brain cells. Age increases the chance that more proteins will be improperly folded. Some scientists now believe that the amyloid proteins are infectious. See “Alzheimer’s Disease” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, for details, including protocols.

Another type of amyloid protein that's improperly folded, and lacks a nucleus and nucleic acid, is a prion (from the phrase "proteinaceous infectious particle"). Its lack of a nucleus causes scientists to call it "unalive," but it still reproduces. Prions are almost impossible to kill or neutralize. They cannot be deactivated with heat (even the high-pressure steam heat of an autoclave), or with ammonia, bleach, hydrogen peroxide, alcohol, phenol, lye, formaldehyde, or radiation. Moreover, prions can remain in soil and other areas for years. After folding into abnormal shapes, they cause nearby normal molecules to abnormally structure themselves as well.

Prions are most often associated with fatal brain diseases, notably sheep scrapie, Bovine Spongiform Encephalopathy (BSE or Mad Cow disease), and Creutzfeldt-Jakob disease (CJD) in humans. A famous prion disease called kuru spread in New Guinea when cannibals ate the brains of those already infected with the disease. Kuru stopped spreading after the practice of cannibalism was discontinued. In the 1990s, BSE spread in Europe when meat and meat byproducts from infected animals were fed to other animals.

The late English organic farmer Mark Purdy believed that prions may result from, rather than cause, damaged tissue because Mad Cow and BSE don't exist in organically raised cattle, or in healthy deer and elk. It's true that healthy animals are more resistant, but some types of prions may in fact be infectious. It's also possible that the Lyme spirochete and other pathogens make the brain more susceptible to becoming infected by (or forming) prions.

According to Dr. Richard Loyd, prions can be removed by either an extract of olive leaf, hydrangea, dandelion and cat's claw, or an extract of elecampane and echinacea. He has also provided the following frequencies.

70, 90, 120, 230, 515, 656, 750, 930, 956, 1106.25, 1214.08, 1378.44, 1525, 1545.9, 1609.375, 1630.86, 1693.36, 1812.5, 1886.25, 1943.65, 1950, 1956.4, 1972.66, 2011.7, 2115.23, 2187.5, 2262.8, 8850, 125210, 15090, 17500, 24400, 29K, 44110, 412K, 417500, 433500, 505K, 72410, 541500, 621610, 791500, 995150

REGENERATION AND HEALING

Although Royal Rife publicly stated that frequencies destroy pathogens, many experimenters today use frequency devices to heal and regenerate tissue. This makes sense. Organisms generate an electromagnetic field, electricity, magnetism—electricity and magnetism are sub-units of an electromagnetic field—scalar waves, and probably other unknown energies too. Electromedicine researchers know that applying the right type of electromagnetic field, electrical current, or

magnetism to the body helps cells repair. Once nutrients freely enter and wastes leave the cells, tissues function.

Both contact and non-contact equipment are used for regenerating cells. Rifers use an EM+ machine, which, like the BCX Ultra, has hand-held plasma tubes (applied to the targeted area) and a stainless steel grounding plate (often placed opposite the targeted area). You can use any electrode (pads) unit, placing the electrodes where they’re needed. Front/back, side/side, and top/bottom positions are common. Patch electrodes—sticky, area-specific patches that adhere to the skin—are useful for this application. Other frequency devices good for cellular rejuvenation include the radiant plasma PERL M+ from Resonant Light, and any of the units from Pulsed Technologies.

The Magnetex[®], Avazzia[™], and Biotransducer[®] (used with the Tennant Biomodulator[®]) are also excellent choices. The VitaSet Generator (VSG) from Pulsed Technologies, which emits regenerative Schumann frequencies, helps with any type of healing. See Appendix A for contact information on the manufacturers, and Appendix C for more details about how the equipment works.

Make sure your nutrient intake is sufficient. This includes good (not fake) fats, minerals, and plenty of clean water. You can use all the frequency therapies in the world, but if your body lacks the raw materials to build new, viable cells, the benefits you receive from any therapy will be limited.

Also see **SCHUMANN RESONANCES**, as well as applicable entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**. Most of the frequencies below are from Bruce Stenulson.

General, Highly Effective—First Choice

I have had extensive experience with 40K, which is mathematically related to the popular 10K but works much better. This frequency has allowed me to still feel refreshed and energized at the end of long, 12-hour work days of teaching and being in contact with thousands of people. Rifers have reported a lessening or complete elimination of various symptoms, including pain and sleeplessness.

40K

General, More

Basic short set: 47, 2720 (this is used for pain; run for at least 30 minutes), 2489

General Organ / Gland Support

From Jimmie Holman.

Primary: 23958, 24354, 28251, 29766, 32121, 32670, 36735, 38280, 40K, 44505, 44583, 45549, 45738, 54531, 56133, 56376, 57519, 58806, 63336, 67977, 71874, 84942, 86394, 87000, 89298

Secondary: 20088, 22386, 27144, 44505, 45927, 46683, 48642, 49329, 56889, 57591, 57599, 60501, 60507, 67512, 67518, 68904, 87846, 90885, 91260, 91719

Adrenal Function, to Balance and Normalize

20, 537, 1335, 2250, 10K, 40K (for as long as desired)

Blood: Capillaries, Cell Production (red, white), Pressure, Circulation, Hemoglobin . . .

—to Stimulate, Normalize, Balance, Clean, and Heal

See **HEART, BLOOD AND CIRCULATION**.

Bones, to Stimulate Healing of Fractures

Electrode patches may work better than radiant plasma. Place an electrode on either side of the break.

First try: 2720 for 45 minutes

Then try: 25, then 7.0, and then 50, for 10 minutes each

And then try: 424, 465, 660 + 690 + 727, 784, 787, 880, 1552, 1560, 1577, 10K, 40K

Calcium Metabolism and Utilization, to Improve

Parathyroid disturbance can cause either an excess or a deficiency of calcium.

First try: 9.6, 10K

Then try: 326, 328, 673.1, 771, 4760.5

Cartilage, to Preserve

See the major heading, **CARTILAGE PRESERVATION**.

Chemical Sensitivity, to Reduce

Also see **BACTERIA**, “*Mycoplasma*, many types,” because chemical sensitivity is often associated with an infection from these pathogens.

440, 443, 10K, 40K (for as long as desired)

Collagen, to Build

0.19, 0.37, 7.25, 45.75, 120.50, 424.00, 467.00, 493.10, 750.00, 922.53

Colon Function, to Balance and Normalize

8, 440, 635, 880, 2500

DNA Repair

Sandalwood essential oil also helps to repair DNA.

528, 731/732

Electrical Sensitivity, to Reduce

With the omnipresence of WiFi and other chaotic-signal technologies, people may become hypersensitive to even beneficial electromagnetic fields. If you want to try Rife Therapy, avoid units that use radio frequency (RF) carrier waves because they may make you feel worse (see Chapter 4). Use EMF protection (see Chapter 1, and Appendices A and C for details). See **SCHUMANN RESONANCES**. Also see **BACTERIA**, “*Borrelia*, all types / Borreliosis / Lyme Disease,” as Dr. Dietrich Klinghardt has reported that in his experience, all of his electro-sensitive clients have Lyme. When exposed to harmful electrosmog, pathogens perceive that they’re being attacked and increase their

production of biotoxins. Lyme poisons cause a reduction of the protective fatty myelin sheath surrounding the nerves, which causes the host to become even more sensitive to electromagnetic radiation.

657

Electrolyte Levels, to Improve

Electrolytes are the electrically charged minerals that allow nutrients to pass through the cell membranes and assist in metabolic and numerous other functions. It is crucial that the electrolytes be balanced.

8.1, 20, 10K, 40K (for as long as desired)

Emotional States, to Stabilize, and to Eliminate Rigidity

15, 644, 764

Endocrine System Function, to Normalize

1537

Energy and Vitality, to Improve

Also see “DNA Repair” in this section.

Run for 3 to 5 minutes each: 1056, 2008, 9999

Also run in this order: 528, 15

Estrogen Production Levels, to Normalize (for Males and Females)

Both men and women produce testosterone, although of course women need less. The body sometimes converts the testosterone into excess estrogen, causing problems. Males can develop “man boobs” or have lowered libido; females can gain weight, have mood swings, develop irregular menstrual periods, and also have lowered libido. DIM (Diindolylmethane), a supplement from cruciferous vegetables, blocks conversion of testosterone into estrogen. Men often require 200 mg daily; women, 100 mg. Also see “Testosterone Production Levels, to Normalize,” in this section.

1351

Heart Function, to Normalize

*Stop! See warning (box) at the beginning of the **HEART, BLOOD AND CIRCULATION** section.*

696

Hypothalamus, to Balance and Normalize

1534, 1413, 1351

Immune System Function, to Normalize / Support

There’s a difference between *stimulating* immune function and *regulating* it. Stimulating increases the number of immune cells and intensifies their activity. Regulating supports immune cells so they behave as they should—if the immune response is hyperactive or hypervigilant, the protocol will soothe it (slow it down); and if the immune response is hypoactive or sluggish, that same protocol

will make it work harder (speed it up). Someone with an autoimmune disorder, whose immune response is already in overdrive, will become worse if the immune cells are stimulated. In such a case, it's desirable to *normalize*, rather than stimulate, the system. Normalizing calms hyperactivity and boosts hypoactivity. This is why it's important to distinguish between the two forms of therapy. Unfortunately, people sometimes use the term "boost" regarding immune function when what they really mean is "regulate."

The rifing literature does not distinguish between frequencies that regulate immune function and those that stimulate it, so monitor your responses carefully when using these frequencies (even though positive reports from rifers suggest that the following frequencies support, rather than boost). Most of these frequencies disable pathogens, and some of them help normalize tissue by adding needed voltage to the cells. As with all therapies, if you have an ongoing negative reaction to a frequency, discontinue using it. Also see **AUTOIMMUNE DISORDERS**.

If there are no known infections, first try 40K. This is the best general frequency discovered so far to restore energy and general wellness. Also try the mathematically related 10K, and 835. All of these are normalizing frequencies.

Then try: 1.2 + 250, 3 + 230, 7.69, 7.7, 9.39, 9.4, 9.6, 20, 28, 146, 464, 522, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 1850

Also try: 8, 432, 1862, 2008, 2128, 2180, 2791, 2855, 2867, 2929, 3347, 3448, 4014, 5611

Also sweep 1850–2400

Inocine Production, to Stimulate and Normalize

Inocine, a nucleic acid, allows organisms to correctly transfer genetic information from one generation to the next. This program applies to stroke recovery and other conditions.

263.11

Kidney Function, to Balance and Normalize

1.1 + 73, 1.2 + 250, 6.3 + 148, 8, 10, 20, 40, 72, 95, 125, 146, 248, 333 + 523 + 768 + 786, 440, 444 + 1865, 465, 522, 555, 600 + 625 + 650, 800, 802 + 1550, 880, 1500, 1600, 3K, 5K, 10K, 40K (for as long as desired)

Ligaments, to Stimulate Healing

Also see **INJURIES**, "Ligament Sprain."

9.7, 50, 120

Liver Function, to Support and Balance

33.13, 537, 751, 802 + 1550, 1552

Lymph System Circulation / Drainage, to Increase

Lymph tissue is so dense that contact units may work better than radiant plasma units. Also see **CHEMICAL**

SENSITIVITY / POISONING. Sauna therapy helps eliminate waste from the body. Make sure to replace missing electrolytes.

1.5, 3.6, 6.3 + 148, 146, 8, 10, 10.36, 15, 15.05, 15.33, 20, 20.5, 66, 146, 324, 428, 440, 444 + 1865, 465, 522, 528, 660 + 690 + 727, 676, 743, 787, 880, 1K, 2112, 3176, 5K, 10K, 40K (for as long as desired)

Mental Function, to Normalize

35

Muscles, to Stimulate Healing of

13.5

Nerves, to Stimulate Healing of

2.0, 657, 10K, 5K, 40K (for as long as desired)

Nervous System, to Balance, Strengthen and Support

Also see all entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

764

Pancreas Function, to Balance

First try: 654

Then try: 1.2 + 250, 10, 15, 20, 26, 440, 444 + 1865, 464, 465, 537, 600 + 625 + 650, 624, 648, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880, 1500, 1552, 1600, 1800, 2008, 2170, 2127.5, 2489, 2720

Pineal Gland Function, to Balance

20, 480, 537, 662

Pituitary Function, to Balance

635

Pituitary Gland, to Stimulate Human Growth Hormone (HGH) Production

645, 1342, 1725

Progesterone Levels, to Normalize

Do these in sequence: 763, 1446, 1443, 763 (again)

RNA Integrity, to Strengthen

637, 40K (for as long as desired)

Study Mode—to Improve Brainpower and Alertness

From Jimmie Holman. Run each frequency for 3 minutes, in the order listed. Sequence can be repeated. Protocol may not produce the desired outcome if it's used on equipment that's not made by Pulsed Technologies.

31040, 58752, 59232, 39488, 46848, 46784, 33792, 37376, 33408, 40K, 48128, 34048, 43520

Tendons, to Repair

120

Testosterone Levels, to Normalize

Also see “Estrogen Production Levels, to Normalize,” in this section. These frequencies are experimental.

For males: 1444 *For females:* 1445

Thyroid Function, to Balance

First try: 160, 763, 660 + 690 + 727, 40K

Then try: 20, 537, 1570, 10K, 40K, 16K

Tissue Healing and Regeneration

47, 266, 1360, 2128, 2720, 5K, 40K (for as long as desired)

Wounds, to Speed Healing From

Try Vitamins C and E, extra bioflavonoids, and selenium. Also see **INJURIES**. Make sure to read the Insert on page 751.

20, 40, 190, 220, 660 + 690 + 727, 787, 880, 2720, 40K (for as long as desired)

End of Regeneration and Healing section.

RELAXATION, TO PRODUCE

See “Calming, to Produce” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

RENAL DISORDERS

See under **URINARY TRACT, Kidneys**.

REPETITIVE STRESS INJURY (RSI)

See “Carpal Tunnel Syndrome / Repetitive Stress Injury (RSI)” under **INJURIES** or **MUSCLES**.

REPRODUCTIVE DISORDERS

See under **MEN** or **WOMEN**.

RESPIRATORY TRACT

The nose, sinuses, throat, and lungs comprise the respiratory tract. Sometimes an infection is localized. Other times, it spreads. Respiratory conditions can be caused or aggravated by allergies to food and pollen, a weak intestinal tract, and environmental chemicals and contaminants.

No matter what infection you have, you can use a medical nebulizer, humidifier, or both. See Sidebar, “Simple, Effective Protocols to Clear the Lungs, Nasal Passages, and Sinuses.”

Mold contamination causing “sick building syndrome” is a serious and widespread problem, so also see the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**. Mold eventually dulls the olfactory nerves, so even if you can’t smell it, it still might be present.

Lungs

The lungs are a pair of very large, spongy organs in the chest cavity on either side of the heart, responsible for respiration (breathing). The lungs protect the heart and they themselves are protected by the rib cage. The left

lung is smaller than the right to provide room for the heart, although each lung does grow larger as the person matures.

Air is inhaled through the nose, into the trachea (windpipe), which branches left and right into the two bronchi, into the smaller bronchioles, and finally the tiny thin-walled air sacs or alveoli. A network of fine capillaries transports blood over the alveolar surface. The alveoli absorb atmospheric oxygen, pass it to the hemoglobin in red blood cells (where it’s carried through the bloodstream), and then excrete, back into the atmosphere, carbon dioxide that’s received from the bloodstream. The honeycombed alveoli have a larger surface area than the outside of the lung to optimize the gas exchange.

The diaphragm is a large sheet of muscle at the base of the chest cavity. The expansion and contraction of the diaphragm (along with the intercostal muscles) increases and decreases air pressure, which expands and contracts the lungs. The moist environment of the lungs makes them susceptible to microbial infections.

Lungs, General Conditions

20, 72, 95, 125, 444 + 1865, 450, 590, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 1800

Abscess from *Nocardia asteroides*

Nocardiosis is transmitted mainly through soil by the bacterium *Nocardia asteroides*, causing abscesses in the lungs, as well as fever and cough that can last several months. There is also the possibility of heart damage, as well as lesions in the brain leading to meningitis.

228, 231, 237, 694, 710, 887, 2890

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 354950 (lowest), 355100 (optimal), and 355350 (highest)

Hz set: 879.83 (lowest), 880.20 (optimal), and 880.82 (highest)

Also from Clark: 17679.39

Actinomycosis

Infection of the brain, lungs, gastrointestinal tract or jaw caused by the fungus *Actinomyces bovis*.

1.1 + 73, 20, 160, 220, 465, 660 + 690 + 727, 787, 10K

Adenovirus Infection

Affects lungs, stomach, and intestines. See **VIRUSES**, “Adenovirus, all types,” for details.

First try: 333 + 523 + 768 + 786, 666, 660 + 690 + 727, 950.6, 958.8, 959, 959.6, 960.4, 962, 967.6, 969.3

Try long set if the above isn't sufficient: 20, 26, 48, 60, 72, 95, 125, 160 (for 5 minutes), 180, 300, 333 + 523 + 768 + 786, 444 + 1865, 522, 555, 787, 802 + 1550, 880, 942, 952, 959, 962, 959 to 969, 1395 (for 5 to 10 minutes), 1500, 2050, 2720, 4868, 5K, 6989, 7001, 7009, 7702, 7762, 7767, 10K

Alternaria tenuis

A fungus associated with lung ailments.

304, 853

Asthma / Bronchial Asthma

Spasm or swelling of the bronchial tubes in lungs. Avoid dairy, sugars, grains, and citrus that could produce mucus. Don't breathe in mold, mildew, and other pollutants.

0.5, 20, 72, 95, 125, 146, 444 + 1865, 522, 660 + 690 + 727, 787, 810, 880, 1233/1234, 1283, 1500, 1600, 1800, 2170, 2720

Bronchial Cancer

See "Lung Cancer" under **CANCER**.

Bronchial Pneumonia

See "Pneumonia / Bronchial Pneumonia" in this section.

Bronchiectasis

Chronic dilation of the bronchi or passages in the lungs, accompanied by coughing and huge amounts of pus (the accumulation of dead white blood cells), often linked to chronic bronchitis, tuberculosis, and whooping cough. Also see "Bronchitis," "Tuberculosis," and "Whooping Cough" in this section.

342, 344 + 510 + 943, 778

Bronchitis

Inflammation of the upper portion of the mucous membranes of the lungs.

9.35, 9.39, 9.4, 20, 72, 333 + 523 + 768 + 786, 344 + 510 + 943, 452, 464, 514, 660 + 690 + 727, 683, 743, 880, 1234, 3672

Bronchopneumonia borinum

See "Pneumonia / Bronchial Pneumonia" in this section.

Catarrh

Mucous membrane inflammation in various places including the respiratory tract. It will also go into the gastrointestinal tract, eyes, and uterus

20, 380, 444 + 1865, 660 + 690 + 727, 787, 800, 802 + 1550, 880

Cold, Chest and Head

Daily ingestion of either echinacea or transfer factor will help build immune function. (Make sure the echinacea tingles in the mouth; otherwise it's not potent.) These noxious microbes constantly mutate to new strains, so also try other frequencies.

1.1 + 73, 20, 72 (for 5 minutes), 120, 125, 146, 333 + 523 + 768 + 786, 344 + 510 + 943, 400, 440, 444 + 1865, 452, 465, 522, 542, 552, 652, 660 + 690 + 727, 683, 720, 725, 746, 751, 766, 768, 776, 787, 800 (for 10 minutes), 802 + 1550, 880 (for 10 minutes), 1K (for 5 minutes), 1110, 1500, 2008, 2489, 3176, 4400, 4412, 5K, 5500, 7760 (for 15 minutes), 8210 (for 5 minutes), 8700, 10K

Cryptococcus neoformans

A yeast that infects the respiratory tract but can turn into a brain infection called meningoencephalitis. Symptoms include headache, nausea, staggering gait, irritability, confusion, and blurred vision.

588, 636 (both from Dr. Richard Loyd), 367, 428, 444 + 1865, 476, 478, 522, 579, 594, 597, 613, 624, 785, 792, 872, 2121, 5880, 5884

Emphysema

Distention from gas or air in the gaps between tissues of the lungs. There are many species that can affect the respiratory tract, so see "*Ascaris lumbricoides* / Roundworm" and other entries under **PARASITES, PROTOZOA AND WORMS**.

Pulmonary Fibrosis / Fibrosis / Idiopathic Pulmonary Fibrosis (IPF)

Scarring in the connective tissue of the lung, making it progressively difficult to breathe. Total respiratory failure can occur, leading to death. "Idiopathic" means that doctors don't know what causes this.

Causes include airborne contaminants such as fungi and asbestos, radiation, drugs, and pathogens. See specific infections if you know what they are. Also see **BACTERIA**, *Staphylococcus*, which is often found in the lungs.

27.5 + 220 + 410

Lung Infection caused by *Gordona sputi*

A bacterium.

381.2, 400.6, 429.1, 435.4, 762.3, 801.2, 858.2, 870.7, 3432.8, 1524.7, 1602.3, 1716.4, 17410.5, 3049, 3204.6, 3483

Nigrospora

Fungus involved in lung, sinus, TB-type infections, and allergies.

302, 350, 764

Simple, Effective Protocols to Clear the Lungs, Nasal Passages, and Sinuses

Organic, therapeutic grade essential oils (EOs) that are antiviral, antibacterial and antifungal, can be used with colloidal silver. The oils are delivered through an aromatherapy device, ultrasonic humidifier, or a medical nebulizer. If you're using a small-chamber nebulizer, add just one drop of an antimicrobial essential oil. If you're using a humidifier, add more essential oils due to the higher volume of silver fluid. Remove any filter or cloth wick from the humidifier first to allow the silver particles to become airborne. EOs can sting unless they're diluted properly. For the nasal wash, use a neti pot or Grossan sinus irrigator.

Inhalation—for Stubborn Infections, Do This First:

- ◆ **Warm Alkaline Water**, 8 ounces (matches the pH in the nasal cavity and prevents the fluid from burning)
- ◆ **Celtic Sea Salt**, ¼ to ½ teaspoon (shrinks the tissues, fights infection, and prevents burning)
- ◆ **Xylitol**, ½ teaspoon (does a fair job of preventing pathogens from attaching to mucous membranes; use xylitol from birch bark and not corn, which is GMO and often from China)
- ◆ **Liquid Iodine**, 2–3 drops (essential nutrient and potent natural germicide)
- ◆ **EDTA** (ethyl-enediamine-tetra-acetic acid), ½–1 teaspoon (helps burst biofilms; good for fungal infections; available as bulk powder online)

Inhalation (Ultrasonic Humidifier):

To colloidal silver, add just a few drops of each EO:

- ◆ **Clove Bud** (*Syzygium aromaticum*), 4 parts
- ◆ **Lemon** (*Citrus limon*), 4 parts
- ◆ **Cinnamon Bark** (*Cinnamomum verum*), 3 parts
- ◆ **Eucalyptus** (*Eucalyptus radiata*), 2 parts
- ◆ **Rosemary** (*Rosemarinus officinalis*), 1 part

Inhalation (Nebulizer):

To colloidal silver, add 1 or 2 drops total of the above EO mixture, as EOs are very potent! The following additional oils are optional. Again, use sparingly.

- ◆ **Oregano** (*Origanum vulgare*), **Tea Tree** (*Melaleuca alternifolia*), **Thyme** (*Thymus vulgaris*), 1 part each

Ingestion:

To open nasal passages and lungs, swallow less than 1/8 of a teaspoon of powdered ephedra (the herb, which is different from the drug extract ephedrine).

In the Ears:

Put a few drops of 3% food grade hydrogen peroxide (H₂O₂) in each ear. Lie on each side and let the H₂O₂ in the opposite ear bubble for several minutes.

Pleurisy

Inflammation of the membrane enfolding the lungs.
20, 72, 95, 125, 444 + 1865, 450, 590, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 2170

Pneumonia / Bronchial Pneumonia

Severe infection and inflammation of the lungs, which fill with copious amounts of fluid and mucus. Symptoms include high fever, chills, cough, and sometimes blood in the mucous lining the lungs.

First try the following frequencies. If they aren't enough, try the rest of the frequencies in the subgroups below for the specific pathogens.

20, 412, 450, 452, 550, 578, 600 + 625 + 650, 660 + 690 + 727, 688, 683, 709.2, 766, 776, 787, 802 + 1550, 880, 975, 1238, 1474, 1862, 2688, 2838.5

Pneumonia / *Klebsiella pneumoniae*

Causes severe pneumonia, an infection and inflammation of the lungs, which fill with copious amounts of fluid and mucus. Symptoms include high fever, chills, and cough. In case there are other pathogens involved in the infection, also see "*Mycoplasma pneumoniae* / Pneumonia" under **BACTERIA; PARASITES, PROTOZOA AND WORMS**, "*Pneumocystis carinii*"; and "Pneumonia / Bronchial Pneumonia," above.

From Dr. Richard Loyd: 130, 410, 446, 650, 970, 7500, 10470, 152500, 493500, 375690, 475540, 398450, 401000, 404650, 419000

Also try: 412, 413, 746, 765, 766, 779, 783, 818, 840, 2838.5

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz sets:

393450 (lowest), 401K (optimal), and 404660 (highest)

416900 (lowest), 419K (optimal), and 421900 (highest)

Hz sets:

975.27 (lowest), 993.98 (optimal), and 1003.05 (highest)

1033.39 (lowest), 1038.60 (optimal), and 1045.79 (highest)

Also from Clark: 19964.61, 20860.78

Mycoplasma pneumoniae / Pneumonia

Mycoplasma pneumoniae causes severe pneumonia, an infection and inflammation of the lungs, usually caught and spread by children and young adults. Symptoms include fluid, high fever, chills, cough, nasal congestion, sore throat, tracheobronchitis, pharyngitis, and mucus and occasionally blood in the lungs. Also associated

with joint, central nervous system, pancreas, liver, and cardiovascular and blood conditions.

First try: 660 + 690 + 727, 688, 709.2, 777, 975, 2688, 2838.5

Then try: 20, 412, 450, 452, 550, 578, 600 + 625 + 650, 683, 766, 776, 787, 802 + 1550, 880, 975, 1238, 1474, 1862

Pneumocystis carinii

First symptoms are fever, fatigue and weight loss—and weeks later, life-threatening pneumonia, with copious amounts of fluid and mucus filling infected and inflamed lungs. Further symptoms include dry cough, chills, chest tightness, and difficulty breathing. Many people who test positive for HIV or take recreational drugs develop pneumonia from this pathogen. The inability of the lungs to transport oxygen into the blood can lead to death. This parasite can also infect the eyes, ears, skin, and liver.

First try: 340, 742 (from Dr. Garvey), 204, 600 + 625 + 650, 660 + 690 + 727, 709.2, 2838.5

Then try: 20, 412, 450, 452, 550, 578, 688, 683, 766, 776, 787, 802 + 1550, 880, 975, 1238, 1474, 1862, 2688

Respiratory Syncytial Virus (RSV)

Most common cause of pneumonia among infants and very young children. Symptoms include cough, fever, runny nose, and wheezing. RSV can cause lifelong infections, especially in the elderly or those with compromised cardiac, respiratory, and immune function.

First try: 1647, 2528, 2542, 3448, 4763

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 378950 (lowest), 380K (optimal), and 383150 (highest)

Hz set: 939.32 (lowest), 941.93 (optimal), and 949.73 (highest)

Also from Clark: 18919.09

Also try: 278, 336, 712

SARS / Severe Acute Respiratory Syndrome / Coronavirus

SARS is probably caused by SARS-CoV, one of several coronavirus strains. Coronaviruses—so named because of the crown, or bulbous corona, at their tops—cause a high percentage of colds in humans, mostly in the winter and early spring.

SARS infects the respiratory and gastrointestinal tracts of humans, dogs, cats, pigs, cattle, birds, and rodents. The pathogen may have originated in China in November 2002 before spreading to

the US, Canada, Singapore, the Philippines, and other countries. Initial symptoms may include sore throat, cough, pneumonia, muscle pain, diarrhea, and anal warts. Humans have a fever of at least 100.4°F (38°C), long with a history of contact with an infected individual. Symptoms generally occur within two to three days following exposure.

Antibiotics, antivirals, steroids, and other drugs have been ineffective. Supplemental oxygen and mechanical breathing support are more successful.

145.9, 165.7, 291.7, 331.4, 437.6, 497.1, 583.5, 662.7, 1167, 1312.8, 1325.5, 1491.2, 2333.9, 2651, 4667.8, 5301.9, 9335.6

Tuberculosis

Highly infectious airborne disease, popularly known for affecting the lungs. Swelling and tumor-like welts of tissue may appear not only in the lungs, but also in the meninges (the membrane around the spinal cord) and the intestines. Other symptoms include fever, cough, and difficulty breathing. The list below is abbreviated. As there are so many frequencies for both the disease and what is regarded as “secondary infections” springing from the disease, also see **TUBERCULOSIS** (the major heading).

First try: 369K (for the rod form, possibly used on Royal Rife’s #4 machine)

Then try: 21508.01, 2127.5, 1070.82, 660 + 690 + 727

And then try: 20, 221, 333 + 523 + 768 + 786, 465, 532, 590, 776, 787, 799, 800, 801, 802 + 1550, 803, 804, 1132, 1500, 1600, 1644, 2008, 2313, 3353, 6516

Nigrospora

Fungus involved in tuberculosis-type infections. 302 (from Dr. John Garvey), 350, 764

Whooping Cough

Caused by bacteria *Bordetella pertussis* or *Bordetella parapertussis*, whooping cough is a serious disease that can permanently disable infants or even cause death. Symptoms include runny nose, diarrhea, fever, and a persistent cough that (mostly in people over 6 months of age, before adulthood) ends with a “whoop” noise when the person breathes. The coughing spells can lead to vomiting and choking.

First try: 526, 765 (both from Dr. John Garvey), 46, 284, 660 + 690 + 727, 697, 906, 9101

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 329850 (lowest), 331K (optimal), and 332250 (highest)

Hz set: 817.62 (lowest), 820.47 (optimal), and 823.57 (highest)

Also from Clark: 16479.52

Also try: 776, 787, 802 + 1550, 832, 880, 1234, 7344

Nose and Sinuses

The nose is lined with mucus and thousands of cilia, or tiny hairlike projections. The cilia trap airborne particles and dirt so they don't get into the lungs.

A sinus is a pouch or cavity in any tissue; but when people say "sinuses," they generally mean the four pairs of air-filled spaces in the skull bones at the face. These spaces are in the upper jawbone under the eyes; in the bone of the forehead over the eyes; between the nose and the eyes, backwards into the skull; and in the center of the skull base. Medical researchers hypothesize that the purpose of the sinuses is to help warm and humidify inhaled air before it reaches the lungs; to increase resonance in the voice; to provide a buffer against blows to the face; to increase the surface area for odor detection; and even to modulate vision (breathing alters the shape of the sinuses, and thus the pressure on the inside of the eyeball changes).

It's relatively easy for the moist nose and sinuses to become blocked and swollen from allergic inflammation or microbial infection. Dr. Murray Grossan invented an electric sinus irrigator that pulses water up through the nose and into the sinuses. Once the dead cells, microbial waste, and excess mucus are mechanically drained, the area is less susceptible to becoming reinfected—and better equipped to remove future debris.

If your nose and sinus problems are chronic, check for a deviated septum, an abnormally crooked positioning of the inside cartilage in the nose that makes it difficult to breathe. Other contributing factors are airborne pollutants, allergies, and dental infections.

If you want to use many numbers that are close together, program your machine for a sweep so you can save time. For instance, one sweep could be 400–472, another sweep could be 600–690, and so on. Also see "Influenza" and "Adenovirus" under **VIRUSES**, and the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and under **PARASITES, PROTOZOA AND WORMS**.

General, Nose and Sinuses

3 + 230, 20, 30, 33, 72, 95, 120, 125, 146, 254, 303, 330, 430, 444 + 1865, 470, 484, 522, 555, 610 + 692 + 980, 620, 624, 644, 646, 660 + 690 + 727, 740, 742.4, 787, 790, 864, 866, 986, 880, 1234, 1550, 1918, 2900, 2213, 2600, 2650, 2950, 4412, 5148, 7344, 10K, 40K

Allergies, Many Types

See **ALLERGIES**.

Anosmia

See "Smell, Loss of / Anosmia" in this section.

Cold, Chest and Head

Daily ingestion of either echinacea or transfer factor will help build immune function. (Make sure the echinacea tingles in the mouth; otherwise, it's not potent.) These pathogens constantly mutate to new strains, so also try other frequencies.

1.1 + 73, 20, 72 (for 5 minutes), 120, 125, 146, 333 + 523 + 768 + 786, 344 + 510 + 943, 400, 440, 444 + 1865, 452, 465, 522, 542, 552, 652, 660 + 690 + 727, 683, 720, 725, 746, 751, 766, 768, 776, 787, 800 (for 10 minutes), 802 + 1550, 880 (for 10 minutes), 1K (for 5 minutes), 1110, 1500, 2008, 2489, 3176, 4400, 4412, 5K, 5500, 7760 (for 15 minutes), 8210 (for 5 minutes), 8700, 10K, 40K

Hay Fever

Inflamed mucous passages in upper respiratory tract and nose, catalyzed by external irritants such as pollen. Symptoms include sneezing, coughing, watery discharge from the eyes, headache, and sinus congestion. Symptoms are due to high levels of histamine—a hormone-like, inflammatory substance produced by certain body cells. The adrenals are intimately tied to allergic responses: when fatigued, the glands can't produce enough cortisol to counter the effects of histamine.

The bioflavonoid quercetin helps. The best formulas contain adaptogenic herbs for the adrenals. With the right formula, the adrenals function and symptoms quickly disappear. See Sidebar on page 731 for a list of adaptogens. One excellent formula is Allergy Modulator™ from Progressive Laboratories. It contains Indian tinospora, holy basil, stinging nettle, *Picrorhiza kurroa*, and brown algae (*Ecklonia cava*).

Some homeopathic remedies (including *Alium cepa*) may help this condition. Eliminate mold, mildew, and chemicals from your environment and food. Also see **ALLERGIES**, and various entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and under **GLANDS, Adrenals**. Hay fever can indicate systemic distress. Don't rely solely on frequencies.

20, 660 + 690 + 727, 787, 880

Nasal Congestion and Infection

20, 440, 444 + 1865, 465, 660 + 690 + 727, 776, 787, 802 + 1550, 880

Nigrospora

Fungus involved in allergies, and in many sinus, lung, and TB-type infections.

302, 350, 764

Odor Sensitivity, Abnormal / Hyperosmia

This can indicate a weakened adrenal system, as well as a toxified system. Also see **GLANDS, Adrenals** and **CHEMICAL SENSITIVITY / POISONING**.

20, 146, 522, 812, 10K, 40K (for as long as desired)

Ozaena

The mucous membranes of the nose atrophy and are accompanied by discharge and crusts.

184, 222, 439

Pemphigus

Rare autoimmune disorder. Symptoms include blisters in the outer layers of the skin and in the mucous membranes of the nose, mouth, and throat. Also see **AUTOIMMUNE DISORDERS** as well as listings for the affected areas of the body.

893 (from Dr. John Garvey), 665, 694

Rhinitis

Runny nose.

1.2 + 250, 3 + 230, 7.69, 7.7, 20, 28, 146, 465, 522, 660 + 690 + 727, 787, 802 + 1550

Sinusitis

Infection in sinus cavities. Symptoms include stuffy or completely clogged nasal passages, pain in sinus cavities in face, headache, discharge of thick green or yellow mucus, feeling of facial “fullness” that gets worse on bending over, and sometimes fever.

Acute sinusitis is most often caused by bacteria such as *Streptococci* and *Staphylococci*, and occasionally the Influenza virus. However, a two-year Mayo Clinic study revealed that more than 90% of 210 people with chronic sinusitis had fungal (rather than bacterial or viral) infections.

Also see “*Nigrospora*” in this section; “Influenza” and “Adenovirus” under **VIRUSES**; and the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** and under **PARASITES, PROTOZOA AND WORMS**.

If you want to use many numbers that are close together, program your machine for a sweep so you can save time. For instance, one sweep could be 400–472, another sweep could be 600–690, etc.

20, 60, 95, 72, 107 (for 5 minutes), 120, 125, 128, 146, 160 (for 5 minutes), 225, 244, 304, 320, 367, 400, 414, 427, 432, 440, 456, 472, 522, 524, 528, 548, 597, 610 + 692 + 980, 614, 615, 618, 660 + 690 + 727, 664, 682, 712, 732, 741, 784, 787, 802 + 1550, 820, 880, 942, 952, 1150, 1234, 1311, 1395 (for 5 minutes), 1466, 1500, 1520, 1600, 1862 (for 5 minutes), 1865, 2K, 2600, 5500, 3672, 4392, 4400, 4412, 7344. Also try a sweep in the 700 range.

Inhalation Therapy is a powerful, effective, and pleasant protocol.

See page 693 for an essential oil recipe.

Smell, Loss of / Anosmia

Can be due to various microbial infections. Also see other entries in this section.

20, 10K (5 minutes each)

Sneezing

Forceful expelling of air through the nose and mouth by spasmodic contraction of the respiratory muscles, in an effort to rid the system of allergens, pollutants, and pathogens that are irritating the nose and respiratory tract. There can be many causes, so see entry pertinent to your other symptoms.

Throat and Lymph Nodes

The throat can be sore for many reasons: microbial infections, food allergies, even pollution. Often when the throat is sore, the lymphatic tissue at the neck is swollen as well; and it is said that the person has “swollen glands.” This is somewhat misleading, because the “glands” in this case are really lymph nodes, part of the lymphatic system. (See lymphatic system for frequencies not covered here.)

The 500 to 600 lymph nodes—clustered in the underarms, groin, neck, chest, and abdomen—are constructed from connective tissue in a honeycomb shape. When the body is fighting an infection, the lymphocytes multiply rapidly, therefore making the lymph nodes swell. The two types of lymphocytes (which have different jobs) are T cells (so called because they mature in the thymus) and B cells (so called because they mature in the bone marrow). The spleen and tonsils are also part of the lymphatic system. The spleen fights infections in the blood, filtering blood rather than lymph.

Electromedicine and frequency devices that are made for contact with the body move lymph better than freestanding radiant plasma units because the dense lymph tissue needs mechanical stimulation to promote flow.

There’s one little known, but major component of lymphatic conditions: excessive mucin. Mucin is a hydrophilic (water-loving), sugar-protein compound naturally present in the connective tissue located in or around lymph, as well as skin, blood vessels, muscles, nerves, and other parts of the body. Excess mucin levels occur in over half of the people who suffer from low thyroid function. Therefore, also see **GLANDS, Thyroid**, “Thyroid, Underactive / Hypothyroidism.”

The symptoms of a sore throat might result from *Candida albicans*, so see that entry under **CANDIDA, FUNGI, MOLDS AND YEASTS**. See **BACTERIA**, “*Streptococcus pyogenes* / Strep Throat” and “*Actinomyces israelii* /

Actinomycosis.” You will have better results if you know the specific microbe involved. Finally, because the kidneys, liver and lymphatic system are all primary channels of cleansing, also see **CHEMICAL SENSITIVITY / POISONING**.

General (short set)

20, 146, 380, 440, 522, 660 + 690 + 727, 760, 776, 784, 802 + 1550, 880, 1600

Adenoids, Swollen

Swollen lymphatic tissue located primarily in the throat, but sometimes in other places too.

14, 20, 333 + 523 + 768 + 786, 428, 444 + 1865, 590, 660 + 690 + 727, 776, 780, 787, 802 + 1550, 807, 810, 880, 1570, 2K, 2170, 2720

Angina Quinsy

Inflammation of a lymph gland in the throat. This is not angina pectoris, which is pain in an area of the heart (in which case you should see that entry under **HEART, BLOOD AND CIRCULATION**). As inflammation may or may not include infection, it has its separate category with fewer frequencies. Also see “Glands, Swollen” in this section.

428, 465, 660 + 690 + 727, 776, 787

Cold, Chest and Head

Daily ingestion of either echinacea or transfer factor will help build immune function. (Make sure the echinacea tingles in the mouth; otherwise it's not potent.) These pathogens constantly mutate to new strains, so also try other frequencies.

1.1 + 73, 20, 72 (for 5 minutes), 120, 125, 146, 333 + 523 + 768 + 786, 344 + 510 + 943, 400, 440, 444 + 1865, 452, 465, 522, 542, 552, 652, 660 + 690 + 727, 683, 720, 725, 746, 751, 766, 768, 776, 787, 800 (for 10 minutes), 802 + 1550, 880 (for 10 minutes), 1K (for 5 minutes), 1110, 1500, 2008, 2489, 3176, 4400, 4412, 5K, 5500, 7760 (for 15 minutes), 8210 (for 5 minutes), 8700, 10K

Flu

See “Influenza” under **VIRUSES**.

Fluke, Lymph

Worms appearing in the lymph vessels.

157, 10050

Glanders

From the bacillus *Pseudomonas mallei*, this condition primarily involves the mucous membranes of the mouth and respiratory system, and occasionally the lymph nodes (where it is called Farcy). Mostly horses, mules and donkeys are affected,

but occasionally the pathogen is transmitted to humans, goats, sheep, cats, and dogs. Glanders is not common in the United States or Europe, but it still appears in Asia, Africa, and South America. Get more frequencies from dnafrequencies.com.

First try: 501, 660 + 690 + 727, 687, 743, 774, 857, 875, 1273

Also try: 20, 787, 880

Glands, Swollen

This may include the tonsils, part of the vast network of lymphatic channels throughout the body. Lymph glands (actually nodes) are prominent in the neck, underarms, and groin. One major job of lymph is to house white blood cells that gobble up harmful microorganisms. As the lymph vessels are designed to protect the body during infection, it makes sense that when the body is sick from a major disease, the tonsils and glands in the neck usually become swollen.

Removing the tonsils simply because you're sick is unwise. The tonsils exist for a reason: they are on the front line of immune defense. However, it's also true that if the tonsils swell excessively, the tongue may be forced forward in the mouth too much and interfere with the position of the teeth. Also, very swollen tonsils may cause mouth breathing, which provides 25% less air than does nose breathing—and with less oxygen in the blood, the heart has to work harder. Therefore, many factors must be considered if you are thinking of removing your child's tonsils (or your own).

It can be difficult to distinguish between swelling due to microbial infection and swelling due to simple clogging, which doesn't necessarily involve pathogens. However, unless the lymphatic vessels are stimulated to relieve the clogging, infection may develop. A severe condition obviously requires a more aggressive approach (and with more frequencies) than does simple congestion.

Use frequencies for specific known microbes. Also see “Lymph System Circulation / Drainage, to Increase” in this section.

452 (from Dr. John Garvey), 1.1 + 73, 1.2 + 250, 20, 146, 380, 428, 440, 444 + 1865, 465, 428 to 482, 522, 590, 600 + 625 + 650, 660 + 690 + 727, 776, 784, 787, 802 + 1550, 1500, 810, 832, 880, 1500, 1600, 1800, 2489, 2720

Lemierre's Syndrome

Once rare, but now more common with antibiotic drug resistance. Features throat and mouth infection and clotting (thrombophlebitis) in the jugular vein. Caused by *Fusobacterium*.

Many strains, from Dr. Richard Loyd: 377, 948, 953

Lymph Plaque

Buildup of solidified material in the lymph channels.
346, 596

Lymph System Circulation / Drainage, to Increase

Lymph tissue is so dense that contact instruments usually work better for this symptom picture than radiant plasma devices. Also see applicable frequencies under **CHEMICAL SENSITIVITY / POISONING**. To eliminate waste from the system, also do sauna therapy. Replace missing electrolytes. First try: 522, 146

Then try: 6.3 + 148, 10, 10.36, 15, 15.05, 20.5, 66, 146, 428, 440, 444 + 1865, 465, 660 + 690 + 727, 676, 787, 880, 3176, 10K

Lymphangitis

Inflammation of lymph vessels in humans and horses, most commonly involving *Strep* but also including other bacteria as well as fungi.

Also see the many entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

574, 778, 1120, 1078, 3176

Lymphatic Leukemia

See “Leukemia, Lymphatic” under **CANCER**.

Lymphocytes, to Stimulate Production of

2791, 2855, 2867, 2929, 3347, 3448, 4014, 5611

Lymphogranuloma, Malignant

See “Hodgkin’s Disease / Lymphogranuloma, Malignant” under **CANCER**.

Pemphigus

Rare autoimmune disorder. Symptoms include blisters in the outer layers of the skin and the mucous membranes of the nose, mouth, and throat. Also see **AUTOIMMUNE DISORDERS** as well as more frequencies for the affected area of the body.

893 (from Dr. John Garvey), 665, 694

Scarlet Fever

Airborne infection from the bacterium *Streptococcus pyogenes*, usually contracted by children. Symptoms include rash, sore throat, flushed face, abdominal pain, chills, head and muscle aches, and a thick white coating on the tongue that peels after several days, giving a strawberry-like appearance. The child may not feel ill, but sometimes untreated scarlet fever can cause heart or kidney damage.

First try: 437, 660 + 690 + 727, 784, sweep 875–885, 2K, 10K

Then try: 20, 465, 787, 880

Spleen, Enlarged, and other Conditions

The spleen, a bean-shaped organ positioned beneath the left breast at an angle, contains the largest mass of lymph tissue in the body, covered by connective and smooth muscle tissue. It is connected to the rest of the lymphatic system by lymph vessels. Unlike the lymph vessels, the spleen does not carry lymphatic fluid; and unlike the lymph nodes, the spleen does not filter or clean lymph. Instead, it produces what eventually turn into antibody-producing blood plasma cells. Antibodies, a basic aspect of the body’s immune function, are the biochemical agents against specific microbial or foreign antagonists in the body. The spleen also breaks down bacteria and worn-out or damaged blood cells, and creates new blood cells. 20, 27.44, 35, 465, 660 + 690 + 727, 787, 802 + 1550, 880, 1800, 2170, 2720, 3176, 10K

Strep Throat

Infection from the bacterium *Streptococcus pyogenes* and other microbes. Symptoms include skin inflammation, sore throat, and sores filled with pus (dead white blood cells).

20, 465, 660 + 690 + 727, 784, 787, 875 to 885, 880, 2K, 10K

Tickle, Chronic

Tonsillitis

See “Glands, Swollen” in this **RESPIRATORY TRACT, Throat and Lymph Nodes** section.

Trench Mouth

Bacterial infection of tonsils and floor of the mouth. Symptoms include inflammation, ulceration, and painful swelling. Also see more entries in this section and under **DENTAL, Mouth and Gums**.

20, 465, 600 + 625 + 650, 660 + 690 + 727, 726, 776, 787, 802 + 1550, 880, 1556

Vocal Cords

The vocal cords (also known as the vocal folds, larynx, or voice box) consist of mucous membrane tissue in the throat attached to ligaments, cartilage, and muscle. When the muscles attached to the cords expand and contract, this changes the shape of the air passage. Air against the vocal cords produces a vibration: sound. The ways in which the folds meet determine the pitch of the sound. When the muscles pull the folds more taut, allowing them to become thinner and shorter, they vibrate more and the pitch is higher. When the muscles pull the folds less, allowing them to become thicker and longer, they vibrate less and the pitch is lower. Sound optimally resonates in the throat, in the mouth, and in the hollow sinuses of the face.

When the voice box is inflamed or infected, it's covered with an extra thick coating of mucus in an attempt to protect the delicate tissues and expel the pathogens. This mucus causes irregular gaps in the airway, which produces hoarseness. The vocal pitch is often lower due to a sore throat, but try to speak in your normal vocal range while providing plenty of abdominal breath support. This will help prevent the vocal chords from becoming more stressed. Smoking, allergies, and improper use of the voice will irritate the voice box. Also see "Glands, Swollen" under **RESPIRATORY TRACT, Throat and Lymph Nodes**.

Hiccups

Spasm of the vocal cords and diaphragm, producing a sharp intake of breath and a coughing noise. May also be symptomatic of other conditions.

20, 10K, 40K (for as long as desired)

Laryngitis or Hoarseness

660 + 690 + 727, 760, 880

ROYAL RIFE'S FREQUENCIES

These frequencies are believed to have come from Royal Rife's #4 machine. However, running the same frequencies on modern equipment may produce different results. There are some good reasons for this.

Rife's equipment had calibration issues and frequency drift. This means that although Rife used state-of-the-art components for his time, measurements couldn't be as precise as those available today. Also, one or more pathogen may have mutated (even slightly) since the scientist's time. Finally, Rife's surviving laboratory notes have sometimes been difficult for modern researchers to decipher.

Why did Rife study some pathogens and not others? He viewed filter passing viruses and smaller bacteria. This entailed using a filter of diatomaceous earth or porcelain, which allowed very small microorganisms to pass through it, while larger bacteria, parasites and worms could not pass through it. Thus, the microbes that Rife surveyed were, by definition, limited. If the scientist had access to our modern equipment, his research would have been more advanced. He undoubtedly would have discovered frequencies for other pathogens, including genetically engineered *Mycoplasma*.

Keep in mind that the frequencies discovered by Royal Rife are a starting point only! Contemporary names of pathogens are listed first, followed by Rife's terminology.

As always, if you know the microorganism that's infecting you and the available frequencies are not helping, go to dna-frequencies.com. Charlene Boehm offers, for a very reasonable fee, frequencies derived via a mathematical formula based on scientific measurements of portions of pathogen anatomy (see Chapter 4 for more information).

SCHUMANN RESONANCES

The beneficial frequencies of the Earth's magnetic field are known as the Schumann Resonances, named after Professor Winfried Otto Schumann of the Technical University of Munich, who calculated them in the 1950s. Approximately fifty lightning flashes bombard the Earth every second, creating an electromagnetic wave of charged particles between the Earth's surface and about 60 miles up.

For hundreds of thousands of years, humans and animals evolved to this "repeating heartbeat" of energy flashes. Our brainwave frequencies, as well as the timing of many other biological functions, are integrally tied to the rhythms of the Earth. It's now understood that the Schumann Resonances are essential for proper DNA signaling as well as for many metabolic processes.

The lowest and most intense of these resonant frequencies occurs at about 7.83 Hz, but there are higher beneficial peaks too, spaced at approximately 6.5 Hz intervals: 14.3 Hz, 20.8 Hz, 27.3 Hz, and 33.8 Hz. These frequency peaks, although affected somewhat by various atmospheric and solar phenomena, remain relatively stable.

Before 1900, the primary electromagnetic (EM) field in the environment was the magnetic field of the Earth. However, in today's electropolluted world, continual bombardment by abnormally high, competing, concentrated electrical stimulation—from high voltage power lines to WiFi—interfere with the body's ability to tap into, and be nourished by, the natural frequencies of Earth.

The Schumann Resonances can be delivered via an electrode device, but the direct benefits will last for only as long as the subject is holding on to the electrodes. The Earth's natural Schumann frequencies are magnetic in nature, so it's unclear how much benefit a radiant plasma unit can provide. However, if you do decide to experiment with a plasma unit to emit these Resonances, choose one without an RF carrier because the RF will interfere with the frequencies.

The non-contact VitaSet Generator (VSG) from Pulsed Technologies is specially designed to emit the Schumann resonances. Its operation is based on magnetism rather than electrical current. With the power on, it can cover the area of a good sized house. See Appendices A and C for that and other EMF-protection items.

SJÖGREN'S SYNDROME

A systemic autoimmune condition involving the moisture-producing glands of the body and sometimes the connective tissue. Sjögren's can affect anyone at any age, although people tend to develop it when they are in their 40s. Named after the doctor who identified it in 1933, Sjögren's affects about ten times as many women than men. It takes an average of three years to diagnose the condition because its symptoms are so diverse. Symptoms may worsen, or (less frequently) disappear. The most common symptoms include excessive dryness in the eyes, mouth, nose, skin, and vagina. Many people also feel chronic exhaustion and pain in the joints and muscles. This condition may affect any organ or gland, causing myriad other symptoms. Other autoimmune conditions may co-exist. Establishment medicine doesn't have a cure; doctors can only suggest artificial tears to wet the eyes, frequent sips of water to wet the mouth and throat, and medications to reduce inflammation.

Research suggests that many Sjögren's sufferers lack the ability to convert dietary oils to a more basic one, gamma linoleic acid (GLA). It can be helpful to supplement with GLA in the form of evening primrose oil or borage oil; collagen in capsules; and glycine, an amino acid that the body often cannot produce in sufficient amounts. Holistic approaches also include bone broth (high in glycine).

Research published in 2017 found that this condition is often triggered by a non-tuberculous mycobacterial (NTM) infection, especially in women age 40–65. (Mycobacteria are not *Mycoplasma*. Whereas mycobacteria species possess a thick, protective, waxy cell wall, *Mycoplasma* don't contain any cell wall.) Tap water is considered the major breeding ground for the most common NTMs: *Mycobacterium gordonae*, *Mycobacterium kansasii*, *Mycobacterium xenopi*, *Mycobacterium simiae*, and *Mycobacterium mucogenicum*. Dr. Richard Loyd discovered *Mycobacterium avium* and *Mycobacterium intracellulare* in many Sjögren's sufferers. He also found that RSV (Respiratory Syncytial Virus), *Cytomegalovirus*, *Staph aureus*, *Candida albicans*, and *Klebsiella pneumoniae* could be involved. However, as this condition can be triggered by any pathogen, pay attention to all possible infectious exposures. Also see **AUTOIMMUNE DISORDERS**. The frequencies below are experimental.

From Dr. Richard Loyd: 529.3, 590, 608.4, 615.7, 617.8, 619.7, 625.9, 632.2, 642.2, 674.3, 680.4, 680.8, 694.1, 700.9, 769.6, 770.6, 773.3, 786.7, 803.4, 818.5, 825, 825.7, 826, 827, 828, 829, 830, 857.6, 858.2, 860.2, 896.9, 937.4, 953.6, 1001.2, 1148.3, 1058.6, 1037.5, 1180, 1235.7, 1552, 2075, 2117.1, 2471.3, 6784.375

Also try: 1950, 6800, 23750, 26710, 28750, 31K, 33K, 33325, 36737, 39167

SKELETAL PROBLEMS

See **BONE AND SKELETON**.

SKIN

Any organ performs multiple tasks based on messages sent to and received from other parts of the body. The skin—with its pain, temperature, and other receptors to and from the brain—is the largest organ in the body. Unlike internal organs (heart, liver, kidneys, etc.) whose tissues are in clusters, the skin's tightly packed cells spread out like a thin blanket. The nervous system and skin evolved from the same embryonic tissue, so the skin is rightly regarded as a huge nervous system on the outside of the body. The skin weighs about six pounds and averages about 20 square feet in area. It contains nerve endings, blood vessels, pigments, hair follicles, oil glands, sweat glands, and keratin-containing cells that waterproof the body and prevent bacteria from entering. Normal skin is supple, clear, smooth, and able to withstand a fair amount of mechanical stress.

The skin is our front line of protection, interfacing between the body and its environment. Skin is porous: small molecules can seep into the bloodstream, so what's rubbed on the skin or scalp should be safe enough to eat. Too much internal waste can exit through the skin, manifesting as pimples, rashes, boils, or other debris. Skin issues that aren't easily eliminated almost always indicate an underlying condition such as an overwhelmed or underperforming liver; so also see frequencies under **LIVER AND GALLBLADDER**, *Liver*.

Normally, the skin eliminates 10% of the body's water and waste. However, through sweating from exercise or a sauna, up to 30% of all waste can be excreted. Thus, the skin is sometimes called "the third kidney." See Chapter 3, **Sauna Therapy** and my book, *The Holistic Handbook of Sauna Therapy*.

General

311, 345, 414, 454, 465, 644, 752, 765, 766, 784, 923

Acne

Skin eruptions due to pores clogged with bacteria, sebum (oil), and often pus (accumulated dead white blood cells). FBI intelligence specialist Melissa Gallico, analyzing decades of cross-cultural data, makes a compelling point that fluoride is the major cause, and that fake foods, sugar and unbalanced hormones (most intense during puberty in males and females) are secondary exacerbating factors.³² Replenish the body's iodine stores. The liver is stressed with its detox job; so also see **LIVER AND GALLBLADDER**, *Liver*.

First try: 368 (from Dr. Richard Loyd), 262 (or its higher octave 67072), 428, 444 + 1865, 450, 465, 564, 660 + 690 + 727, 760, 778, 787 (or its higher octave 100736), 880

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 383750 (lowest), 387K (optimal), and 389K (highest)

Hz set: 951.22 (lowest), 959.28 (optimal), and 964.23 (highest)

Also from Clark: 19267.60, 959.28

Caring for Your Skin

Most skin care products cause the very problems they are presumably created to prevent, because they contain poor quality and chemically synthesized ingredients. These inappropriate substances include sodium laurel sulfate compounds; glycols; artificial dyes, perfumes and preservatives; and even solvents and alcohols. Many of these substances are not only irritants, they're also carcinogenic. The simplest and purest ingredients are the most effective. You can mix your own blends from some of the following. (Please note, this list is only a guide to get you started.)

- ◆ **Shea, Cocoa, and Mango Butters.** Bases to which lighter oils and other ingredients can be added for moisturizing creams.
- ◆ **Oils of Almond, Apricot, Argan, Avocado, Coconut, Grapeseed, Jojoba, light (not virgin) Olive, Rose Hip Seed, Sesame.** Add to thicker butters for moisturizing. Also use as carrier oils for essential oils. Coconut is excellent for both external and internal use on mucous membranes, as it's antimicrobial.
- ◆ **Essential Oils, All Skin Types.** Bergamot, Carrot Seed, Lavender, Orange, Patchouli, Rose.
- ◆ **Essential Oils, Dry Skin.** Chamomile, Cedarwood, Geranium, Lavender, Myrrh, Palmarosa, Rose, Sandalwood.
- ◆ **Essential Oils, Oily Skin.** Bergamot, Cypress, Geranium, Lemon, Lime, Orange.
- ◆ **Essential Oils, Blemishes and Acne.** Geranium, Lavender, Neroli, Patchouli, Rose, Rose Hip Seed, Tea Tree, Vetiver.
- ◆ **Essential Oils, Aging Skin.** Cypress, Frankincense, Lavender, Myrrh, Neroli, Patchouli, Palmarosa, Rose, Sandalwood, Tangerine, Ylang Ylang.
- ◆ **Vitamin E.** A natural preservative in skin creams, it helps prevent scarring when used alone. Break open a capsule and apply liberally to affected area. Works best when used immediately after the area is wounded.
- ◆ **Castor Oil.** Eliminates scars and wrinkles, helps heal wounds, and is even germicidal.
- ◆ **Aloe Vera.** Can tighten sagging skin and help prevent wrinkles. Also helps heal rashes, blisters, burns, and cuts.
- ◆ **Clay.** For rashes, blisters and cuts, and even open sores and wounds. Make a poultice. (For detailed instructions, see Chapter 3, **Activated Charcoal, Clay, and Castor Oil.**)

See Appendices F and G for a list of toxins and safe substitutes for cleaning and personal care items.

Acupuncture Energy Field Disturbance (from scars)

Damaged tissue fibers, which create lumps, can be due to surgery, injury, overuse of muscles, or chronic tension. Internal and external scars can interfere with blood and oxygen flow, as well as the flow of energy in the meridians at the location of the scar. Because scar tissue is irregularly patterned, it can pull on adjacent tissue and cause pain. It's wise to get rid of scars if possible. Neural therapy can reestablish the energy channels blocked by scarring. Also see "Adhesion / Scar" in this section.

5.9, 18, 19.2

Adhesion / Scar

An adhesion or scar is internal or external abnormally fibrous tissue (comprised of the same proteins as collagen) that forms due to injury and sometimes inflammation or infection. Adhesion fibers are aligned in a single direction—making the area lumpy, discolored, painful or itchy—with minimal tissue function. Scars can interfere with blood and oxygen flow, and energy flow in the meridians.

For external skin scars, you can break down abnormal fibers and heal the tissue by massaging the area with castor oil at least twice a day. The homeopathic remedy *Thiosinaminum* 30C (mustard seed oil) is taken three times a day for several months for scars and even fibroids. Also try a 635–660 nm (red wavelength) LED over the area with an essential oil blend of sandalwood, lavender, frankincense, and myrrh. The LED and essential oils may not physically reduce the adhesions, but they may energetically break its negative effect on the meridians.

For new scars that are still open wounds, keep the area wet with colloidal silver or liquid Vitamin E (break open a capsule). Cover with gauze and repeat several times daily. Either or both will heal the skin.

If you suspect that you have an infection, try the frequencies for the pathogen involved, including "*Staphylococcus pyogenes aureus*" under **BACTERIA**. This and other pathogens may cause the body to produce scarring in an effort to contain the bacterium.

19.2, 190, 465, 600 + 625 + 650, 660 + 690 + 727, 685, 700, 760, 776, 787, 802 + 1550, 832, 880, 1K, 1500, 2170, 2720

Anthrax

Often fatal disease characterized by sores on skin filled with pus (accumulated dead white blood cells). See "*Bacillus anthracis* / Anthrax" under **BACTERIA**.

Athlete's Foot

Itching, inflammation, flaking, and sometimes burning of skin on the foot. Commonly (but not solely) caused by *Epidermophyton floccosum*, a fungus that attacks the feet, skin, nails, and sometimes groin (where it is called jock itch). The fungi that attack the skin are often interchangeable and do not confine themselves to any one area. Also see the various *Trichophyton*, *Microsporon* and

Microsporium entries, as well as “General Fungus / Molds / Yeasts,” under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

644, 766 (both from Dr. John Garvey), 856 (from Dr. Richard Loyd), 20, 345, 465, 634, 660 + 690 + 727, 784, 802 + 1550, 880

Bedsore

Ulceration and decay in the skin due to constant pressure and lack of circulation and air, usually from staying in bed in a fixed position over a period of time.

1.1 + 73, 1.2 + 250, 20, 465, 660 + 690 + 727, 784, 787, 802 + 1550, 880

Blackhead

In a pore, a plug made from a combination of sebum (oil) and bacteria that is partially exposed and dark in color. Also see “Acne” in this section.

778

Blister

Fluid beneath the skin encased in a sac, due to a burn or friction.

465, 660 + 690 + 727, 787, 880, 10K

Boil

Inflammation at the skin due to severe local infection. According to one naturopath, boils are often caused by one or more of the *Staphylococci* bacteria, whose frequencies are included among the others below. Also see “Furunculosis *Herpes*” in this section.

6.8, 48, 60 + 100, 333 + 523 + 768 + 786, 465, 590, 660 + 690 + 727, 802 + 1550, 787, 880

Bruise / Contusion

Pain, swelling, and discoloration of unbroken skin. A popular remedy in both cream and homeopathic forms is *Arnica*, which is often combined with other remedies in low doses. Also see **INJURIES**, and the Insert, “Supplemental Therapies for Injuries,” on page 751.

9.1, 110, 2720, 10K, 40K (for as long as desired)

Burns, Most Types, including from Radiation

190, 200, 465, 660 + 690 + 727, 787, 880, 10K

Capillary Congestion and Bruising

See “Capillaries, to Stimulate Healing of” under **HEART, BLOOD AND CIRCULATION**.

Carbuncle

Inflammation of the skin accompanied by pus, which is dead white blood cells in tissue liquefied by microbes. See “Boil” in this section and in **BACTERIA**, “*Staphylococcus pyogenes aureus*.” Also see **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*Candida albicans*,” as people who suffer from *Candida* overgrowth often have boils and carbuncles.

Cellulitis

See **CELLULITIS**.

Contusion

See “Bruise / Contusion” in this section.

Cuts, to Speed Healing

Don’t use electrodes directly on cuts. The fluid contained in an open wound, and even the seemingly negligible amount in a scab, will conduct enough electric current to cause discomfort or pain. Also see “Adhesion / Scar” in this section.

20, 60, 72, 95, 125, 660 + 690 + 727, 740, 787, 790, 880, 5K, 10K, 40K (for as long as desired)

Cyst, Sebaceous

A closed sac just under the skin, containing cheesy-looking skin secretions, usually caused by swollen hair follicles. Mostly appearing on the face, neck and trunk, a sebaceous cyst is generally slow-growing, painless, and easily moved beneath the skin. Occasionally it will become inflamed and tender.

75, 76, 543

Dematium nigrum

Soil fungus found in wounds, often appearing as an infected patch of skin.

243, 738

Dermatitis / Eczema

Skin inflammation with itching and burning. According to some sources, if conditions such as eczema are suppressed with steroid creams—instead of being properly eliminated by natural means—the eczema can gravitate to the lungs and manifest later as asthma.

9.19, 9.2, 9.39, 9.4, 20, 120, 415, 660 + 690 + 727, 664, 707, 770, 787, 802 + 1550, 2180, 916, 2127.5, 2720, 5K, 10K, 40K (for as long as desired)

Elephantiasis

Abnormal skin cells due to obstruction in lymph and blood circulation, caused by an infestation of a certain type of *Filaria* worm. Also see **PARASITES, PROTOZOA AND WORMS**, “*Ascaris lumbricoides* / Roundworm.”

112, 120, 623, 710, 824, 865

Erysipelas

Skin inflammation caused by *Streptococcus pyogenes* and other pathogens.

20, 465, 616, 660 + 690 + 727, 735, 776, 787, 845, 880, 2K, 10K, 40K (for as long as desired)

Erythema

See under **HEART, BLOOD AND CIRCULATION**.

Erythrasma

Red blotchy rash, often in folds of skin due to heat.
From Dr. Richard Loyd: 488

Facial Toning

Intended to tighten the skin and lessen wrinkles. An electrode or hand-held bulb unit would be more effective than a freestanding radiant plasma unit. Specially designed electromedical devices made specifically for the face may work even better. Such units use the tiniest amounts of electrical current to restore skin tissue on the face.

1.2 + 250

Feet, Excessive Sweating / Sudor Pedis

148

Fibrosarcoma

See under **CANCER**.

Fissure

Grooved or furrowed sore, like a slit, either on the skin or mucous membranes.

20, 787, 10K, 40K (for as long as desired)

Folliculitis

Tiny pimples. Also see "Acne" in this skin section.

174, 482, 5311

Furunculosis Herpes, including boils

Also see **VIRUSES, Herpes, all types**.

20, 116, 200, 465, 660 + 690 + 727, 770, 802 + 1550, 787, 1K, 2K

Hives / Urticaria

Skin eruptions, usually due to allergies to foods and sometimes extreme changes in temperature. Pay attention to your diet and exposure to chemicals.

4.9, 6.3 + 148, 95, 125, 146, 444 + 1865, 522, 660 + 690 + 727, 787, 880, 1800

Jock Itch

Peeling skin, irritation and itching in the groin and genitals caused by *Epidermophyton floccosum*, a fungus that attacks skin, nails, and also the feet (where it is called athlete's foot). The fungi that attack the skin are often interchangeable and do not confine themselves to one area, so also see, under **CANDIDA, FUNGI, MOLDS AND YEASTS**, the various *Trichophyton*, *Microsporon* and *Microsporum* entries, "General Fungus / Molds / Yeasts," and "*Candida albicans*."

644, 766 (both from Dr. John Garvey), 856 (from Dr. Richard Loyd), 20, 345, 465, 634, 660 + 690 + 727, 784, 802 + 1550, 880

Keratosis Pilaris

Sometimes called "chicken skin," with this disorder the openings of the hair follicles become clogged with excess keratin. Keratin is the tough, insoluble protein comprising hair, nails, horns, and hooves. The horny wads of keratin are small and pointed, which causes the skin to itch and become red. In some cases, pus forms around the sweat glands. Keratosis pilaris occurs when skin cells—which should flake off as a fine dust during the normal course of shedding to make room for new skin—remain stuck in the follicular orifices. The keratin plug cannot be ejected with pressure. Sometimes hair is found coiled up within the keratin.

Appearance can range from small bumps with the consistency of sandpaper to more serious lesions that look like acne. Lesions are generally numerous, similar to each other, and evenly spaced apart. The keratinization may appear on the upper arms, buttocks, thighs, and occasionally the face. Sometimes the pores become infected due to scratching or abrasive tight-fitting clothes. The condition is said to worsen during cold dry weather and improve during warm humid weather. The majority of people who get this condition are females during puberty, although people who smoke and drink alcohol are also at risk. (The burden of toxins from tobacco and alcohol indicates liver toxicity.)

Allopathic treatment often involves moistening lotions and topical steroid creams, but these are often ineffective at providing even temporary relief and they might be detrimental over time. Also, they don't address the root cause of the condition. However, natural medicine offers some solutions. The first involves healing the gut, because faulty digestion can manifest in skin disorders. Eliminate gluten, dairy, and other allergenic foods. Supplement daily with probiotics. An improperly functioning liver can cause skin conditions, so do a liver-gallbladder cleanse.

For topical relief and healing of the skin, the skin must be exfoliated, or gently scrubbed so dead material is removed from its surface. Pathogens must be eliminated so the skin doesn't become infected. And the dry skin must be moisturized.

Many of the following ingredients have multiple functions. Some people are irritated by what others find soothing, so experiment with combinations. For an exfoliation paste, try baking soda and finely ground sea salt in a little water, perhaps with antibacterial Manuka honey. Coconut oil possesses germicidal, anti-inflammatory, and moisturizing properties. Gently scrub the skin with what you find soothing, rinse, and repeat. Vitamin A contains natural retinol, which encourages cell turnover and helps prevent the hair follicles from clogging. Some people simply squeeze the oil from several capsules onto the affected areas and gently massage it in. (The liver has a high Vitamin A requirement.) Some people find relief from Vitamin E, dribbled onto the skin in a similar way.

These last ingredients are not only germicidal but astringent, contracting tissues and thus diminishing discharges: raw apple cider vinegar (available in most health food stores and even supermarkets) and citrus oils. Essential oils of lemon, grapefruit, or orange can also be helpful. In lieu of essential oils, you can boil the chopped rinds of these citrus fruits in water for about 10 minutes. Strain, and refrigerate the yellowish liquid in an airtight jar, applying with cotton as needed. The essential oils should also be refrigerated to keep them fresh.

See frequencies for other entries in this section. Also see entries under **CANDIDA, FUNGI, MOLDS AND YEASTS** if there is a fungal component to this condition. Make sure to address applicable entries under **LIVER AND GALLBLADDER, Liver**. If this condition persists, see **AUTOIMMUNE DISORDERS**.

Leukoderma / Vitiligo

Deficiency of pigmentation of the skin. White blotches appear, usually covering small areas of the skin but slowly become larger over time. There is some evidence that this is an autoimmune condition in which the body destroys its own pigment cells, or melanocytes (so called because they are comprised of melanin). Causes can include impeded circulation, and physical and emotional stresses (with resulting hormonal imbalances). There might be other autoimmune diseases in the family, along with diabetes, hair loss, hypothyroidism, and possibly even cancer.

Internally, take B-complex vitamins (including PABA, part of the B-complex). Use PABA cream externally. See **BACTERIA**, “*E. coli* / *Escherichia coli*”; **PARASITES, PROTOZOA AND WORMS**, “General (unspecified)”; applicable frequencies under **LIVER AND GALLBLADDER, Liver**; various entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**; and **AUTOIMMUNE DISORDERS**. Also see **BACTERIA**, “*Mycoplasma*, many types,” as this infection is often the beginning of autoimmune conditions.

20, 440, 444 + 1865, 600 + 625 + 650, 660 + 690 + 727, 787, 880, 2112

Lipoma

Fatty tumor, usually benign and in clusters, often just beneath the skin. It is not known exactly what causes lipomas, but improper fat metabolism and liver dysfunction are thought to be involved. Also see “Liver Cancer” and other entries under **CANCER** in case the tumors become malignant; as well as various entries under **LIVER AND GALLBLADDER, Liver**.

47 (for 5 minutes), 606 (for 5 minutes), 709 (for 5 minutes). Also sweep 2K–2200; or do 2K–2200 in increments of 5 Hz, staying on each number for 30 seconds to 1 minute

Mange / Follicular Mange / Scabies

A contagious dermatitis, caused by mites, which primarily reside in the hair follicles. This primarily affects mammals.

From Jimmie Holman. The research team of Pulsed Technologies emphasizes that the frequencies be delivered in precisely the order written, and that they might not work on units other than those manufactured by Pulsed Technologies: 64260, 60720, 59784, 55860, 55272, 49500, 45540, 49500, 44100, 43900, 40480, 40194, 38220, 37840, 37444, 35192, 31878

Also try: 253 and 693 (for 10 minutes, from Dr. John Garvey), 90 to 110, 701, 774, 920, 1436, 2871, 5742

From Dr. Hulda Clark: 735K or 1821.88 (for units unable to reach the KHz range)

Melanoma metastasis

See under **CANCER**.

Mole

Raised benign tissue on skin, usually dark. A mole can grow due to a systemic overgrowth of *Candida albicans*, so also see this and the many other entries under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

20, 120, 177, 464, 600 + 625 + 650, 626, 659, 660 + 690 + 727, 784, 880

Mycosis Fungoides

See under **CANCER**.

Pemphigus

Rare autoimmune disorder. Symptoms include blisters in the outer layers of the skin and in the mucous membranes of the nose, mouth, and throat. Also see autoimmune disorders, and entries for the affected area of the body.

893 (from Dr. John Garvey), 665, 694

Pigmentation Deficiency

See “Leukoderma / Vitiligo” in this section.

Pimples

See “Acne” in this section.

Psoriasis

Chronic inflammation characterized by scaly red patches covered with white scales. Although the symptoms appear on the skin, psoriasis might be more accurately regarded as an autoimmune condition because the T cells (white blood cells involved in immune function) mistakenly attack healthy skin cells. The overactivity of the T cells cascades into other bodily responses that causes skin cells to grow too quickly and move to the top layer of the skin in days rather than weeks. Dead skin accumulates on the surface more quickly than the body can remove it; hence, thick, itchy scales form. The skin can become so cracked that it bleeds. Up to 30% of people with psoriasis develop severe joint damage, and are also more prone to eye problems, diabetes, and heart disease.

This condition requires long-term treatment. Some practitioners recommend Vitamin D3, which helps modulate immune response, regulate the growth and differentiation of skin cells, and influence the activity of immune cells. Except for areas near the equator, being outside generally doesn't provide enough sun to allow the skin to make its own Vitamin D. Therefore, the vitamin is taken in supplement form. People with serious conditions should have their Vitamin D levels tested, because too high amounts can be toxic. However, for most people who need immune support, a safe substance to take in any amount is colostrum. Some people who are highly intolerant of dairy cannot handle colostrum, but they can take the concentrated immune support molecules, transfer factors.

Also see, under **CANDIDA, FUNGI, MOLDS AND YEASTS**, "*Epidermophyton floccosum* / Athlete's Foot / Jock Itch" and the various *Candida* and *Microsporum* entries.

1.2 + 250, 7.69, 7.7, 10, 28, 35, 64, 95, 96, 60 + 100, 104, 110, 112, 304, 428, 600 + 625 + 650, 660 + 690 + 727, 664, 680, 776, 786, 787, 800, 802 + 1550, 880, 1500, 1552, 2K, 2008, 2127.5, 2170, 2180, 2489, 2720, 3K

Pyoderma (or Pyodermia) Gangrenosum

Ulcerous pus-filled lesions on the skin, usually the feet or hands, sometimes caused by various trauma or injury to the skin and often occurring with other diseases such as ulcerative colitis, rheumatoid arthritis, diabetes, and hepatitis. This symptom picture usually erupts suddenly. Assess the condition of the heart, eyes, liver, central nervous system, bones, lymph nodes, gastrointestinal tract, spleen, and bones. Recurrences may sometimes occur, and residual scarring is common.

132 (from Dr. Garvey), 123, 663, 967, 974, 1489, 1556

Ringworm

Roundish red rings and flaking on the skin and sometimes the scalp, accompanied by itching, pain and soreness, caused by various microorganisms, especially fungus. The fungi that attack the skin are often interchangeable and do not confine themselves to one area. Also see "Tinea Versicolor" in this skin section and, under **CANDIDA, FUNGI, MOLDS AND YEASTS**, the various *Trichophyton*, *Microsporon*, *Microsporum*, and "General Fungus / Molds / Yeasts" entries.

***Microsporon audouini* fungus cause**

From Jimmie Holman. The research team of Pulsed Technologies emphasizes that the frequencies be delivered in precisely the order written, and that they might not work on units other than those manufactured by Pulsed Technologies:

90K, 83840, 83375, 81920, 81290, 74062.5, 68K, 65875, 65625, 62845, 61638.75, 59562.5, 57500, 52480, 51465, 51200, 48K, 47600, 47410.63, 46812.5, 45K,

41920, 41687.5, 40960, 40645, 37031.25, 34K, 32937.5, 32812.5, 31422.5, 30819.38, 29781.25, 28750, 26240, 25732.5, 25600, 24K, 23800, 23705.31, 23406.25

Also try: 285, 422, 831, 1222

***Microsporum canis* fungus cause**

Prevalent in dogs and cats as well as children.

347, 402, 600 + 625 + 650, 970, 1644

Rosacea

A chronic skin disease, mostly on the face and sometimes the eyes, afflicting about 14 million people in the US. Early stage symptoms include redness or flushing in the forehead, nose, cheeks and chin; burning; swelling and inflammation; pimples; and dilated blood vessels that show through the skin. Advanced stage symptoms include thickened skin. With eye involvement, symptoms include inflammation, redness, dryness, itching, burning, tearing, sensitivity to light, and the sensation of having sand in the eye. The nose may swell. It appears most frequently in adults with fair skin between the ages of 30 and 60. It's more common in women, particularly during menopause. Contributing factors may include low stomach acid, and deficiencies in Vitamin B12 and iron.

Aggravating factors include hot baths, intense heat, extreme cold, strenuous exercise, sunlight, wind, hot or spicy foods and drinks, alcohol, emotional stress, and long-term use of topical steroids on the face. Try parasite and kidney cleanses, a liver-gallbladder flush, colonics, or sauna therapy to ease the skin's waste disposal burden. Take protease enzymes on an empty stomach to scavenge the wastes. Apply essential oils of lavender, chamomile, sandalwood and rosehip, and use green tea compresses.

Electromedicine practitioner Dr. Jerry Tennant reports finding the *Herpes simplex* virus in every case of rosacea that he treats, so see "*Herpes simplex 1*" and "*Herpes simplex 2*" under **VIRUSES**. Some people also find success with frequencies for "*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer," under **BACTERIA**.

02, .52, .73, .83, 2.5, 217.5, 545.28, 697.5, 775.75, 875.28

Scarring

See "Adhesion / Scar" in this section.

Scleroderma

Connective tissue disorder involving hardening of the skin, blood vessels, and muscles. No frequencies are known; but avoiding nightshades may prevent tissue calcification. See Chapter 3, **Food**.

Shingles

Inflamed skin along the nerves from the *Herpes zoster* Virus 3. This condition is extremely painful, so much so that the person cannot tolerate being touched. Outbreaks

tend to occur the most during stress. Also see **VIRUSES, Herpes, all types**.

20, 26, 120, 304, 444 + 1865, 574, 660 + 690 + 727, 664, 787, 800, 802 + 1550, 816.4 (for five minutes), 880, 914, 1500, 1552, 1557, 1600, 1633, 1800, 1864, 2127.5, 2170, 2720, 3K, 3176, 3343, 5K

Skin Cancer

See under **CANCER**.

Skin Tags

Skin tags (also known as acrochordon) are bits of swollen, loose skin that grow out from normal skin. They can be flesh colored or pigmented, smooth or irregular. Some hang from a stalk. They usually appear on the eyelids, face, neck, underarms, upper chest, and groin. They're more common in older adults, and more prevalent in women than men. Doctors don't know the cause, but they remove the tags with a sharp blade, freeze or burn them at the stalk, or strangle them with a thread. Usually skin tags don't become malignant (cancerous).

Some people eliminate skin tags by taking 250 mcg (micrograms, not milligrams) of chromium picolinate twice a day. This suggests a connection to blood sugar disorders. One woman applied essential oil of cinnamon topically and after several days, the skin tag shriveled up and disappeared. Tea tree oil also works well. Another enterprising person, knowing that hydrogen peroxide stronger than a 3% solution is caustic (make sure the H₂O₂ is food grade), repeatedly applied it to the area with a cotton swab. After regular applications, the tag fell off. Some people have also had success using colloidal silver (see Chapter 3, **Colloidal Silver**). Liquid iodine treatments may also help. There are no frequencies for skin tags, but the liquids that remove the tags suggest microbial involvement. Especially because the tags have a stalk, they could be related to warts, which are virally caused. See "Wart" entries in this section.

Tinea Versicolor

A skin condition, usually on the front of the chest, caused by the fungi *Microsporon furfur* or *Malassezia furfur*. Symptoms include scaling, reddish or gray itchy patches, and dry brittle hair. Also see "Ringworm" in this section. 222, 225, 491, 616, 700

Urticaria

See "Hives / Urticaria" in this section.

Vitiligo

See "Leukoderma / Vitiligo" in this section.

Wart, most types

A rough, abnormal bump appearing on the skin and sometimes the genitalia, caused by a virus.

173, 466, 495, 644, 660 + 690 + 727, 767, 787, 797, 877, 907, 915 (for 30 minutes), 918 (for 30 minutes), 953, 1500, 1600, 1800, 2008, 2127.5, 2170, 2720, 2489

Wart, Plantar

Caused by the Human *Papilloma* Virus (HPV), a plantar wart grows on the bottom of the foot.

From Dr. Richard Loyd: 40, 320, 570, 850, 857, 874, 907, 30250, 173210, 301800, 402850, 410700, 475470, 2976935

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 404700 (lowest), 405K (optimal), and 406750 (highest)

Hz set: 1003.15 (lowest), 1003.89 (optimal), and 1008.23 (highest)

Also from Clark: 20163.76, 20128.91, 1002.16

Wart, Venereal / Condyloma

See under **MEN, Penis** or **WOMEN, Vagina, Labia and Clitoris**.

End of Skin section.

SLEEP APNEA

People with sleep apnea stop breathing for 10 to 30 seconds at a time during sleep, up to 400 times every night. This interrupts the normal sleep pattern (sometimes they wake up). Continual sleep deprivation, along with the lack of deep, dream-filled, rapid eye movement (REM) sleep, can lead to cardiovascular problems, memory loss, depression, weight gain, and headaches.

Conventional doctors often attribute sleep apnea to a failure of the brain to signal the muscles to breathe. Their common treatment is a compressed-air machine that attaches to a mask worn by the sleeper, designed to keep the airways open with pressure. However, the machine is noisy, and many users find the masks uncomfortable. A simpler aid that might work, and which doesn't require a prescription or doctor visits, is a rubberized mouth guard that fits over the top and bottom teeth at night. It keeps the airways free and prevents snoring. Just one brand is Z Quiet®. Some people simply tape their mouth shut at night.

Many factors are involved in sleep apnea. Check for spine subluxation if the head is pushed unnaturally forward, choking the air supply. (When standing, a person's ear should be positioned directly above the shoulder. Many people's heads are too far forward.) Overweight may cause the soft tissue in the rear of the throat to collapse and block the air passages. (If overweight, check thyroid function.) Exercise will help improve respiratory tract efficiency. Infections and allergens might be involved. A neurological cause may involve the vagus, trigeminal and/or phrenic nerves. The throat muscles should be manipulated and exercised.

Nitric oxide, often deficient in sleep apnea sufferers, dilates blood vessels and encourages increased oxygen flow. It's available as a nutritional supplement. Other supplements (citrulline and arginine) provide the precursors for the body to make its own nitric oxide.

SNAIL FEVER

See "*Schistosoma* / Schistosomiasis / Snail Fever" under **PARASITES, PROTOZOA AND WORMS**.

SNAKEBITES

Common poisonous snakes in the US include the rattlesnake, copperhead, cobra, coral, and cottonmouth (water moccasin). Snakes generally avoid people unless they feel provoked.

If someone has been bitten, keep them still. Don't massage the bite area or raise the area above heart level, and don't give them food or drink. Monitor vital signs such as temperature, pulse, and breathing rate. If the person becomes pale, this may indicate shock; so lie them flat, raise their feet about 12 inches, and cover them with a blanket or coat. Immediate medical treatment is needed, especially if the area surrounding the bite is painful or begins to swell and change color—indicating that the snake was venomous and tissue damage is occurring. Symptoms of snakebite poisoning include blurred vision; difficulty breathing, swallowing or talking; rapid pulse; nausea and vomiting; convulsions; numbness, tingling or paralysis; excess salivation; sometimes diarrhea; drowsiness; headache; fever; loss of muscle coordination; and swelling in tongue, throat or elsewhere.

No frequencies exist for snakebites. Go to an emergency room so you can receive an injection to neutralize the venom!

That said, I know several people who had no such access, and successfully dealt with snake and scorpion bites by applying electricity to the bitten area. Current can come

from a "rife" electrode unit, a Tennant Biomodulator® or Avazzia™ (see Appendix C), or even a TENS unit (whose excessive voltage in this case is actually beneficial). They applied the electrodes around the bite as close to the wound as possible. They felt pain, but boosted the current as high as they could tolerate it. The electrical current is reported to neutralize the venom by denaturing its proteins. Other people (with or without using current) have successfully drawn out the poisons by applying poultices, made from clay or activated charcoal, onto the wounds. Fresh poultices were added as soon as the previous ones had dried.

SPLEEN, ENLARGED, AND OTHER CONDITIONS

The spleen, a bean-shaped organ angled beneath the left breast, contains the largest mass of lymph tissue in the body, covered by connective and smooth muscle. It's connected to the rest of the lymphatic system by vessels. Unlike the lymph channels, the spleen does not carry lymphatic fluid; and unlike the lymph nodes, the spleen does not filter or clean lymph. Instead, it produces what eventually turn into antibody-producing blood plasma cells. Antibodies, basic

to the body's immune response, are the biochemical agents against specific pathogenic or foreign antagonists in the body. The spleen also breaks down bacteria and worn-out or damaged blood cells, and creates new blood cells.

Also see lymph frequencies under **RESPIRATORY TRACT, Throat and Lymph Nodes**.

See under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**. Also see listing pertaining to body part and condition.

TRENCH FEVER

See “*Bartonella quintana* / Bartonellosis” under **BACTERIA**.

TRENCH MOUTH

See under **DENTAL, Mouth and Gums**.

TREPONEMA DENTICOLA, TREPONEMA PALLIDUM

See under **BACTERIA**.

TRICHINELLA SPIRALIS

See under **PARASITES, PROTOZOA AND WORMS**.

TRICHINOSIS

See under **PARASITES, PROTOZOA AND WORMS**.

TRICHODERMIA VIRIDE

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

TRICHOMONAS, ALL TYPES

See under **PARASITES, PROTOZOA AND WORMS**.

TRICHOPHYTON, ALL TYPES

See under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

TRIGEMINAL NEURALGIA

See “Neuralgia, Trigeminal” under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

TRYPANOSOMA BRUCEI GAMBIENSE

See under **PARASITES, PROTOZOA AND WORMS**.

TUBERCULOSIS, ALL TYPES

This very infectious airborne disease, known to affect the lungs, also causes swelling and tumor-like welts of tissue in the intestines and meninges (membrane around the spinal cord). Symptoms may also include fever, cough, and difficulty breathing.

Can be caused by bacteria, viruses, or fungi. The many frequencies so close to each other illustrates the mutation capacity of these pathogens. Experiment with all the frequencies to deal with both the disease and the so-called secondary infections springing from the disease. Run sweeps.

Tuberculosis, General

First try: 21508.01, 2127.5, 1070.82, 660 + 690 + 727

Then try: 20, 216, 221, 333 + 523 + 768 + 786, 465,

532, 590, 720, 740, 776, 784, 787, 799, 800, 801, 802 + 1550, 803, 804, 1132, 1500, 1552, 1600, 1644, 1840, 2008, 2313, 3353, 6516

Mycobacterium avium / Bird Tuberculosis

See “Tuberculosis, Aviare / *Mycobacterium avium* / Bird Tuberculosis” in this section.

Mycobacterium tuberculosis

For more frequencies, see under **BACTERIA**. The rod form, from Royal Rife, possibly used on his #4 machine: 369K

Nigrospora-related Tuberculosis

This fungus is found in the lungs and sinuses, causing TB-type infections and allergies.

302, 350, 764

Tuberculosis, Aviare / Mycobacterium avium / Bird Tuberculosis

Mycobacterium avium causes tuberculosis not only in birds, but sometimes in cattle and other animals. Symptoms of cough, fatigue, fever, weight loss and night sweats can also be caught by humans, particularly those with compromised immune function.

First try: 532 (from Dr. John Garvey), then (all the rest from Dr. Richard Loyd) 455, 303, 332, 342, 438, 440, 529.3, 532, 590, 697, 698, 720, 731, 741, 748, 770, 824.5, 825.7, 860.2, 937.4, 2075, 3113, 6515

Add to above (from Dr. Loyd): 529.3, 608.4, 615.7, 617.8, 619.7, 625.9, 632.2, 642.2, 674.3, 680.4, 680.8, 694.1, 700.9, 769.6, 770.6, 773.3, 786.7, 803.4, 818.5, 830, 857.6, 858.2, 860.2, 896.9, 953.6, 1001.2, 1037.5, 1058.6, 1148.3, 1180, 1235.7, 2117.1, 2471.3, 6784.375
Also sweep 825–830

Also try Clark’s *Mycobacterium* TB-related: 21508.01, 1070.82

Tuberculosis, Bovine

523, 3353 (both from Dr. John Garvey), 229, 600 + 625 + 650, 635, 748, 757, 838, 877

Tuberculosis, from Klebsiella bacterium

221, 1132, 1644, 2313, 6516 (all from Dr. John Garvey), 217, 220, 686, 729, 748, 1644

Tuberculosis, Secondary complications

776, 465, 2008, 2127.5

Tuberculosis Virus

1552, 2565

End of Tuberculosis section.

TULAREMIA

See “*Francisella tularensis* / Tularemia / Rabbit Fever / Deer Fly Fever” under **BACTERIA**.

To help eliminate debris from tumors: 688 Hz

TUMORS, BENIGN

An abnormal enlargement of tissue not caused by swelling. Different types of tumors are composed of different tissue: connective, fatty, fibrous, glandular, lymphatic, mucosal, muscular, nerve, bone, or blood vessel. They are typically round, but can have varied sizes and shapes. Tumor size can range from 1 mm to 50 mm or larger. The body's tendency to form tumors is a deviation from its optimal DNA. Diet can play a part in their formation, especially tumors of the breast. Eliminating chocolate and coffee can make a huge difference in shrinking the tumor or eliminating it entirely.

Spectro-Chrome Color Therapy has been shown to be remarkably successful at eliminating tumors. Don't let its "low tech" simplicity and affordability deter you from using it (see Chapter 3). In case the body has created the tumor to envelop and contain toxins, see **CHEMICAL SENSITIVITY / POISONING**. Get into the sauna. And because benign tumors can become cancerous, watch them—and also see applicable entries under **CANCER**.

Benign, unspecified

From Dr. Richard Loyd: 688

Actinomyces related

In Dr. Richard Loyd's experience, most benign tumors are caused by *Actinomyces israelii*.

From Dr. Richard Loyd: 4262 and 787

Adenoma, Cervical / Cervical Adenoma

Although a tumor in the cervix may be benign, it can become malignant. You are strongly advised to see "Uterine Cancer or Tumor" and other entries under **CANCER**. Also see "Cervical Polyp" in this section.

From Dr. John Garvey: 443

Cervical Polyp

Also see **CANCER**, because benign tumors can grow and become malignant. Also see **WOMEN, Uterus, Cervix, Ovaries and Fallopian Tubes**, "Cervical Adenoma."

689 (from Dr. John Garvey), 277, 288, 687, 744, 867

Cladosporium fulvum

A fungus that causes raised, irregular nodules of soft tissue that can be slow to heal.

438 (from Dr. John Garvey), 233, 344 + 510 + 943, 776

Cholesteatoma

Benign inflammatory tumor usually found in middle ear and mastoid bone region. Also see **CANCER** in case the tumor becomes malignant.

453, 618, 793, 5058

Lipoma

Fatty tumor, usually benign and in clusters, often just under the skin. Establishment medicine doesn't know exactly what causes lipomas, but improper fat metabolism and liver dysfunction are very likely involved. Also see "Liver Cancer" and other entries under **CANCER** in case the tumors become malignant, as well as various entries under **LIVER AND GALLBLADDER, Liver**.

47 (5 minutes), 606 (5 minutes), 709 (5 minutes). Also sweep 2K–2200; or do 2K–2200 in increments of 5 Hz, staying on each number for 30 seconds to 1 minute

Meningioma

Benign, slow growing tumor of the meninges (membranes around brain and spinal cord.) Also see **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**, "Meningitis."

446, 535, 537

Myoma

See "Uterine Tumor / Myoma" in this section.

Nasal Polyp

Benign growth or tumor inside nasal passage.

542, 1436

Ovarian Cyst

Sac containing a liquid in the ovary.

982 (from Dr. John Garvey), 567, 711

Papilloma Virus Cyst

Certain type of tumor containing skin cells.

6.3 + 148, 110, 264, 634, 760, 762, 767, 848, 874, 907, 917, 1102

Polyp, General

20, 146, 444 + 1865, 465, 522, 600 + 625 + 650, 660 + 690 + 727, 1600, 1800, 2008, 2127.5, 2170, 2489, 2720

Prostate Tumor

Benign tumors can become malignant, so you are strongly advised to also see "Prostate Cancer" under **CANCER**.

20, 60 + 100, 72, 95, 125, 146, 410, 442, 444 + 1865, 465, 522, 660 + 690 + 727, 688, 748, 766, 776, 787, 802 + 1550, 1875, 2008, 2050, 2127.5, 2170, 2250, 2489, 2720

Toxins from the Tumors, to Help Eliminate

688

Uterine Tumor / Myoma

Tumor comprised of muscle tissue. Also see **CANCER**.

453, 689, 832 (all from Dr. John Garvey), 127 (in case of malignancy), 253, 420, 453, 832

In addition, sweep from 420 to 482 for at least 30 minutes

End of Tumors, Benign section.

TYPHOID FEVER

See “*Salmonella typhi* / Typhoid Fever” under **BACTERIA**.

TYPHOID VIRUS

See under **VIRUSES**.

-U-

ULCER, STOMACH (PEPTIC) OR DUODENAL

See “*Helicobacter pylori* / Peptic (Stomach) or Duodenal Ulcer” under **BACTERIA**.

ULCER, VENTRICULAR

See under **HEART, BLOOD AND CIRCULATION**.

UNDULANT FEVER

See the various *Brucella* entries under **BACTERIA**.

UREAPLASMA UREALYTICUM

See under **BACTERIA**.

UREMIA / UREMIC POISONING

See under **URINARY TRACT, Kidneys**.

URETHRA CONDITIONS

See under **URINARY TRACT, Bladder and Urethra**.

URINARY TRACT

The urinary tract consists of a pair of kidneys (at the waist on either side of the body), the muscular urinary bladder (near the pubic bone), two ureters (tubes that connect the kidneys to the bladder), and the urethra (which runs from the bladder through the genitals and to the outside of the body). Normal urine is generally pale yellow, but its color and odor can vary, depending on diet, concentration of solutes to water, and the amount of bile and other bodily secretions it contains. Urine should be clear and not cloudy. If it's cloudy, or contains blood or particulate matter, this usually indicates infection.

Proportionately for their size, women's bladders are smaller than men's; so women need to urinate more frequently. When urine is held inside the body for too long, the urinary tract is prone to more infections. The fewer public toilets generally available to women than to men, along with the structure of the female body (there's less room for a large bladder as internal reproductive organs take up a lot of space), helps explain why more females than males suffer from bladder infections.

Hot peppers, spices, fats, fried foods, alcohol, and caffeine-laden foods (black tea, chocolate, cola and coffee) are very irritating to the urinary tract. These, and large amounts of protein, burden the kidneys especially; so omit all of these foods from your diet until the condition clears. Natural ingredients have a good track record for treating urinary tract conditions (see next page). An herbal parasite cleanse is sometimes recommended too.

Infections in one part of the urinary tract can spread to others, so try all the frequencies if you aren't getting results. Use 2050 with all programs. Also see the three pathogens that most commonly appear in cases of infection: “*Candida albicans*” under **CANDIDA, FUNGI, MOLDS AND YEASTS**, “*E. coli*” under **BACTERIA**, and “*Trichomonas vaginalis*” and other parasites under **PARASITES, PROTOZOA AND WORMS**.

Bladder and Urethra

The urinary bladder—or simply “bladder” as it's generally called—is a hollow muscular organ located behind the pubic bone. It is connected to the urethra, a narrow tube leading to the outside the body via the genitals. The shape of the bladder depends on how much urine it contains at a given time. The bladder receives urine from the kidneys and holds it until the urine is expelled.

Bladder Cancer

See under **CANCER**.

Bladder Infection / Inflammation with possible Urethra involvement

Pain and burning when urinating, sometimes with pus or blood in the urine. Both the urethra and bladder may be infected. Symptoms also include a persistent urge to urinate, the frequent passing of small amounts of urine, and cloudy, strong-smelling urine (which indicates infection). Women may have pelvic pain and men may experience rectal pain.

All of the urinary tract structures are in such close proximity to the vagina that it's easy for a vaginal infection to turn into a urinary tract infection. Also, women should be especially careful when they wipe themselves while on the toilet. Wiping from the front of the vagina toward the anus (instead of in the other direction, which many women tend to do) will help reduce the chances of infection. Often the infection will be from *E. coli*, so also see **BACTERIA, E. coli / Escherichia coli**. For a shorter program, see “Cystitis,” below.

1.1 + 73, 1.2 + 250, 9.39, 9.4, 10, 20, 40, 72, 95, 125, 246, 360, 444 + 1865, 465, 498, 530, 600 + 625 + 650, 630, 642, 660 + 690 + 727, 724, 726, 771, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2045, 2050 (or 2045 to 2050 for 20 minutes), 2127.5, 2170, 2250, 2720, 10K, 40K

Cystitis

Inflammation of the bladder; symptoms are similar to those of an infection (above). Cystitis can be due to chemicals or bacteria, although the non-bacterial inflammation can always develop into an infection. For a more thorough program, see above.

9.39, 9.4, 20, 465, 498, 530, 630, 660 + 690 + 727, 787, 802 + 1550, 880, 2045, 2050 (or 2045 to 2050 for 20 minutes)

Herbs and Other Natural Remedies for the Urinary Tract

Dr. Richard Schulze, a foremost US herbologist, was taught by the late Dr. John Christopher, a pioneer in the field. Schulze has a doctorate in natural medicine and herbology, as well as degrees relating to herbal pharmacology. The herbs in his urinary tract formulas are below. Note that all the herbs have benefits that extend beyond the urinary tract, some of which have been documented in medical journals.

- ◆ **Burdock Root.** Antifungal. Antibacterial.
- ◆ **Corn Silk.** Anti-inflammatory. Diuretic (increases flow of urine).
- ◆ **Goldenrod.** Anti-inflammatory. Aquaretic (increases flow of urine without electrolyte loss).
- ◆ **Gravel Root (Queen of the Meadow).** Eliminates gravel/stones from kidneys by dissolving uric acid.
- ◆ **Horsetail.** Anti-inflammatory. Antimicrobial. Diuretic.
- ◆ **Hydrangea Root.** Diuretic. Prevents formation of stones in kidneys and bladder.
- ◆ **Juniper Berry.** Antibacterial. Antifungal. May be toxic in large amounts over long periods.
- ◆ **Marshmallow Root.** Somewhat weaker version of *Uva ursi* (last entry, below).
- ◆ **Orange Peel.** Antibacterial. Antifungal. Dissolves kidney stones.
- ◆ **Parsley Root.** Anti-inflammatory. Antimicrobial.
- ◆ **Peppermint Leaf.** Antibacterial. Antiviral. Antifungal. Heavily resistant to *E. coli*, which often infects the urinary tract. Increases blood circulation.
- ◆ **Uva Ursi Leaf.** Antimicrobial. Astringent. Diuretic. Was standard of care for urinary infections before pharmaceutical antibiotics were developed. Works best in an alkaline environment, so don't use in conjunction with cranberry juice (which is acidic).

Other Natural Remedies

- ◆ **Cranberry Juice.** Comes as unsweetened juice or powder extract in capsules. Antibacterial. Contains mannose, a non-carbohydrate sugar that prevents bacteria from adhering to the urinary tract walls.
- ◆ **Mannose or D-Mannose (see above).** Available separately as a powder.
- ◆ **Garlic.** Antifungal, antibacterial, antiviral. To benefit from the fresh clove, crush it and wait five minutes for its phytochemicals to activate. No-odor capsule supplements are also available.

Cystopyelonephritis

Inflammation encompassing kidney and bladder. Also see other entries in this **URINARY TRACT, Bladder and Urethra** section.

From Dr. John Garvey: 1385

Gravel in Urine

Gravel consists of minerals and acids—phosphates, calcium, oxalate and uric acid particles—that have not been completely broken down by the body. There might be a metabolic problem, so consult a health care provider. Make sure to drink pure water in which all the minerals are completely dissolved. 2.65, 20, 660 + 690 + 727, 787, 880, 3K, 40K

Incontinence

Inability to contain urine. Incontinence in both children and adults involves the same pathogens, although with children there may also be emotional factors or food allergies involved. Eliminate irritants such as spices, chemicals, and caffeine from the diet. Bed wetting can also be due to a parasite infection, so see **PARASITES, PROTOZOA AND WORMS**, “*Enterobius vermicularis* / Pinworm / Seatworm.” Also see entries under **GASTROINTESTINAL TRACT**. 465, 660 + 690 + 727, 787, 802 + 1550, 880, 10K

Interstitial Cystitis

Chronic inflammation of the bladder. This condition is far more severe than an ordinary bladder infection. Symptoms include not only frequent and painful urination along with recurrent urinary tract infections, but in many cases, chronic pelvic pain and pain with sexual intercourse as well. Conventional medicine can only treat symptomatically, with pain mediations, anti-inflammatory medications, and a drug that coats the lining of the bladder so the symptoms are less severe.

Arizona physician Stephen Fry identified a fungus, *Funneliformis mosseae* (formerly known as *Protomyxzoa rheumatica*), living in the blood and urine of the majority of hundreds of people with interstitial cystitis. In addition to the frequencies below, the anti-inflammatory herb *Mimosa pudica* (also known as the “sensitive plant” or the “touch-me-not plant”) has shown great promise in treating this condition. It also helps with Lyme, its co-infection *Babesia*, and many types of intestinal parasites, which may accompany interstitial cystitis.

515, 1583

Streptococcus enterococcinum

Often present with digestive and urinary infections. 409, 686

Urethritis

Inflammation, with or without infection of the urethra. Symptoms include burning on urination, perhaps with discharge. The discharge is more easily observed in the penis than in the vagina. In women, a bladder/urethra infection often affects the genital area, so also see **WOMEN, Vagina, Labia and Clitoris**, “Vaginitis.” Also see “*Ureaplasma urealyticum*” under **BACTERIA**.

1.2 + 250, 72, 95, 125, 444 + 1865, 465, 600 + 625 + 650, 660 + 690 + 727, 776, 787, 802 + 1550, 832, 880, 1500, 1600, 1800, 2127, 2170, 2720

Urethritis from *Chlamydia trachomatis*

The *Chlamydia trachomatis* bacterium is sexually transmitted. It can cause a variety of infections, including urethritis (inflammation of the urethra or urinary tube), lymphogranuloma venereum (venereal disease characterized by inflammation and ulceration of the lymph glands), proctitis (inflammation of rectum and anus), and even conjunctivitis (inflammation of the mucous membranes of the eyes). Women need to be especially careful because the infection may result in miscarriage and infertility. If a woman is infected while giving birth, the pathogen can be passed to the infant in the birth canal, causing eye infections and pneumonia. New findings suggest that this organism may play a developmental role in Multiple Sclerosis and cancer, so it's important to get your condition treated. Also see **BACTERIA**, “*Chlamydia pneumoniae*” and “Lymphogranuloma venereum (LGV)” under **MEN, Penis** or **WOMEN, Vagina, Labia and Clitoris**.

From Dr. John Garvey: 430, 620, 624, 840, 2213
Also try: 430, 555.7, 866, 1111.4, 2222.8

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set:

379700 (lowest), 381K (optimal), and 383950 (highest)

Hz set:

941.18 (lowest), 944.40 (optimal), and 951.72 (highest)

Also from Clark: 18968.87

Kidneys

The kidneys are a pair of reddish organs four to five inches in length—shaped just like kidney beans, which take their name from the organ—located below the ribs in the back of the body on either side of the spine. These delicate organs filter the entire volume of the blood about 20 to 25 times each day, through about one million tiny sieve-like nephrons. Body chemistry is critically dependent on efficient kidney function. The kidneys are responsible for

maintaining a constant volume of water in the body, a uniform acid/base concentration of the blood, and the proper ratio of minerals to water in the system. They also regulate blood pressure and remove wastes from the body. The kidneys contain special cells that sense what to pass to the bladder as waste, to be expelled in the urine (wastes include metabolic byproducts urea and ammonia, as well as drugs and other toxins), and what to reabsorb and recycle back into the blood (such as minerals that the body needs). Inflammation or infection in the kidneys can be very serious because both of these conditions can indicate, and further cause, a buildup of wastes and toxins. Once these organs become overloaded, they cannot filter properly; and then contaminated material gets dumped back into the bloodstream, circulating to all of the body's tissues.

The kidneys play an indirect but crucial role in heart function. If there aren't enough Omega 3 fats in the diet, the kidneys secrete rennin. This causes the adrenals to secrete angiotensin, which causes the blood vessels to constrict and raise blood pressure. Blood pressure often normalizes once the kidneys are supplied with Omega 3s.

Read the beginning of this section for dietary suggestions; it cannot be emphasized enough how damaging caffeine is to the kidneys. See Sidebar, “Herbs and Other Natural Remedies for the Urinary Tract.” See the entries under **URINARY TRACT, Bladder and Urethra**. Because the kidneys, liver, and lymphatic system are all primary channels of elimination and detoxification, also see **CHEMICAL SENSITIVITY / POISONING**. And see **BACTERIA**, “*E. coli / Escherichia coli*,” which causes the majority of urinary tract infections.

Bright's Disease

Generic term for acute and chronic disease of the kidneys, which can involve many types of dysfunction. See other entries in this section.

Cystopyelonephritis

Inflammation encompassing the kidneys, bladder, and surrounding areas. Also see other entries under **URINARY TRACT**.

1385

Infection (if you don't know what you have)

First try: 264 (from Dr. John Garvey), 1.1 + 73, 1.2 + 250, 6.3 + 148, 9.19, 9.2, 10, 20, 40, 440, 444 + 1865, 465, 594, 660 + 690 + 727, 776, 787, 802 + 1550, 880, 1500, 1600, 2008, 10K, 40K

Then try: 72, 95, 125, 146, 333 + 523 + 768 + 786, 424, 434, 522, 555, 600 + 625 + 650, 834, 2045, 2050 (or 2045 to 2050 for 20 minutes)

Kidney Function, to Balance and Normalize

1.1 + 73, 1.2 + 250, 6.3 + 148, 8, 10, 20, 40, 72, 95, 125, 146, 248, 333 + 523 + 768 + 786, 440, 444 + 1865, 465, 522, 555, 600 + 625 + 650, 800, 802 + 1550, 880, 1500, 1600, 3K, 5K, 10K

Kidney Meridian, to Balance

Electrodes placed directly on key kidney points may work the best.

9.2

Kidney Stones

Small, hard masses formed in the kidney from crystallized minerals (usually calcium) and other substances in urine. Once a stone starts moving—from the kidney into the ureter and bladder, and then out of the body through the urethra—it can cause extreme pain and other symptoms including nausea, vomiting, fever, chills, pain in the back or side, and a burning feeling while urinating.

Diet and lack of fluids contribute to the formation of kidney stones. However, in 1938, a doctor examined stones passed by his clients and found bacteria embedded deep inside them. Phytotherapist Kerry Bone suggests a dietary increase of magnesium and a dietary decrease of oxalates (found in coffee, tea, chocolates, and some fruits including tomatoes and oranges). This will help prevent stones from forming. The herbs cascara and yellow dock may help bind calcium in the urine and make it less likely to solidify. The bacterial aspect of kidney stones is a good reason to use frequencies. Also see “*Ureaplasma urealyticum*” under **BACTERIA**.

30.5, 787, 444 + 1865, 660 + 690 + 727, 880, 1552, 3K, 6K, 10K, 40K (for as long as desired)

Nephritis

Inflammation of the kidneys. When the kidneys are inflamed, they can develop an infection, so see other entries in this. Also see “*Ureaplasma urealyticum*” under **BACTERIA**.

1.1 + 73, 10, 20, 40, 264, 274, 423, 636, 465, 660 + 690 + 727, 787, 688, 880, 1500, 2045, 2050 (or 2045 to 2050 for 20 minutes), 3K, 10K, 40K

Nephrosis

Degenerative changes in the kidney without the inflammation.

1.1 + 73, 40, 465, 660 + 690 + 727, 787, 880, 1500, 10K, 40K (for as long as desired)

Pyelitis

See “Infection” in this section.

Streptococcus enterococcinum

Often present with digestive and urinary tract infections.

409, 686

Tumor, benign, caused by the *Papilloma Virus*

See **CANCER** if the tumor persists.

6.3 + 148, 110, 264, 634, 760, 762, 767, 848, 874, 907, 917, 1102

Uremia / Uremic Poisoning

Often occurs during kidney failure, when excessive amounts of nitrogen-rich waste products accumulate in the blood. Also see “Lymph System Circulation / Drainage, to Increase” under **LYMPHATIC SYSTEM**.

911

End of Urinary Tract section.

URTICARIA

See “Hives / Urticaria” under **SKIN**.

UTERINE CANCER OR TUMOR

See under **CANCER**.

UTERINE TUMOR, BENIGN / MYOMA

See under **TUMORS, BENIGN**.

UTERUS, DROPPED OR TIPPED

See “Uterus, Prolapsed / Dropped or Tipped” under **WOMEN, Uterus, Cervix, Ovaries and Fallopian Tubes**.

-V-

VACCINATIONS, REACTIONS TO

See under **CHEMICAL SENSITIVITY / POISONING**. Also see Chapter 1, **The Vaccine Controversy**.

VAGINITIS

See under **WOMEN, Vagina, Labia and Clitoris**.

VALLEY FEVER

See “*Coccidioides immitis* / Valley Fever / Coccidioidomycosis / Coccidiosis” under **CANDIDA, FUNGI, MOLDS AND YEASTS**.

VARICELLA

See “*Herpes Virus Type 3 / Herpes zoster* / Chicken Pox / *Varicella* / Shingles” under **VIRUSES**.

VARICOSE VEINS

See under **HEART, BLOOD AND CIRCULATION**.

VARIOLA / SMALLPOX

See under **VIRUSES**.

VEGETATIVE DYSTONIA

See “Dystonia, Vegetative” under **MUSCLES**.

VEIN INFLAMMATION

See under **HEART, BLOOD AND CIRCULATION**.

VENEREAL DISEASES, ALL

See under **MEN, *Penis*** and **MEN, *Urinary***; or under **WOMEN, *Vagina, Labia and Clitoris*** and **WOMEN, *Uterus, Cervix, Ovaries and Fallopian Tubes***.

VENEREAL WARTS / CONDYLOMA

See “Wart, Venereal / Condyloma” under **MEN, *Penis*** or **WOMEN, *Vagina, Labia and Clitoris***.

VERTIGO

Vertigo is dizziness. It can be caused by microbial infections, neurological impairment, a head injury, adrenal exhaustion, or low blood pressure. See the appropriate entry for your specific issue along with entries under **EAR**, because the inner ear is responsible for maintaining one’s sense of balance. If the vertigo persists, be sure to see “Brain Tumor” under **CANCER**, because dizziness is a noted symptom of having a brain tumor.

4, 5.8, 9.19, 9.2, 20, 60 + 100, 660 + 690 + 727, 787, 880

VIRUSES

Viruses are much smaller than bacteria, and thus much more difficult to view under most microscopes in their active state. The phrase “active state” instead of “live state” is used because science does not regard viruses as living organisms. A virus cannot infect a host, replicate, or sustain its functions without appropriating some of the host’s own cellular material—proteins, lipids, and nucleic acids. This means that a flu virus, for instance, may contain as much biological material from the infected host as what the virus itself originally contained. This is why we have the categories “swine” flu or “bird” flu.

Once inside the host’s cell, viruses assume complex shapes and structures, causing physiological changes that favor viral replication while damaging the efficiency and performance of the host’s cells. Different strains of viruses differ in how they enter the host cell; seize, alter and use that cell’s biological material; mature; and spread through the host.

The medical establishment is aware that when a virus is treated with conventional antiviral drugs, another virus sometimes becomes activated. This is also true with vaccines: someone inoculated against a specific virus doesn’t contract that virus, but instead becomes susceptible to a different one. If the same pattern occurs when you use a frequency, be prepared for the subsequent need to rife for a different virus.

General (if you’re not sure what virus you have)

776, 787, 802 + 1550, 832, 840, 880, 1570, 1998, 2008, 2052, 2127.5, 2489, 2490, 5K

Adenovirus, all types

Can cause severe respiratory, gastrointestinal, urinary, and eye infections. Symptoms include severe sore throat, swollen lymph nodes, diarrhea, vomiting, headache, fever, abdominal cramps, burning or bloody urine, and inflamed

red eyes. Extremely infectious, Adenoviruses disable the normal growth limit function of the cell, leading to malignant tumors. These viruses can be fatal to those with weakened immunity. Many viruses remain in the kidneys and lymph, to be excreted in the stool months after the initial infection.

First try: 739 (from Dr. Richard Loyd), 333 + 523 + 768 + 786, 666, 950.6, 958.8, 959, 959.6, 960.4, 962, 959, 967.6, 969.3, 7767

From Dr. Hulda Clark. Use the Hz set for units unable to output KHz. With such a wide frequency range, you may want to sweep.

KHz set: 371,450 (lowest), 375K (optimal), 386,900 (highest)

Hz set: 920.73 (lowest), 929.53 (optimal), and 959.03 (highest)

Also from Clark: 334K or 827.90, 371K or 919.62, 393K or 974.15, 568K or 1407.93, 28729.05, 19566.32, 18670.15, 18471, 16628.88

If the above isn’t sufficient, also try: 20, 26, 48, 60, 72, 95, 125, 160 (for 5 minutes), 180, 300, 444 + 1865, 522, 555, 660 + 690 + 727, 787, 802 + 1550, 880, 942, 952, 962, 1395 (for 5 to 10 minutes), 1500, 2050, 2720, 4868, 5K, 6989, 7001, 7009, 7702, 7762, 7767, 10K

Type 2 – 1008.7

Type 5 – 1008.8

Type 12 – 1062.3

Type 17 – 1032.8

Type 40 – 1059.5

Adenovirus-36 (AD-36)

Solid evidence implicates at least two strains of Adenovirus in obesity: AD-36 and AD-37. Researchers discovered that monkeys, mice and chickens injected with the virus gain more weight than do uninfected animals. The virus causes the number of fat cells to increase, as well as triple in size (thus storing more fat). Studies also show that 20% to 30% of overweight humans are infected with the AD-36, compared to 11% of the nonobese population.

If the frequencies below don’t work for you, get them at dnafrequencies.com.

This “fat buster” frequency is from Jeff Sutherland. Run 6028.99 once or twice a week for 40 minutes.

The frequencies below are used by Dr. Richard Loyd. Run for 5–10 minutes each, with a wide sweep of 15 on either side of the main signal): 864, 5218.75, 5796.87, 5859.37, 6140.25, 8875

From Dr. Marty Monahan: 128, 130, 132, 314, 342, 402, 467, 518, 979

Adenovirus-37 (AD-37)

From Dr. Marty Monahan (he uses the same numbers for Adenovirus-36): 128, 130, 132, 314, 342, 402, 467, 518, 979

If these don’t work for you, go to dnafrequencies.com.

Seasonal Vulnerability to the Flu

People are more vulnerable to getting sick when seasons change, especially during spring and fall, and experts may now know why. . . . it's not the cold air that makes people sick; rather, it's the virus. Rhinoviruses and coronaviruses, the two main causes of the common cold, can multiply quickly when the weather is cool—but not too cold. . . .

The influenza virus multiplies and spreads more easily and rapidly when the air is cold and dry. As a result, people tend to catch the flu during winter. . . . Researchers . . . discovered that a seven-degree drop in ambient temperature could interrupt the body's ability to stop cold viruses from multiplying. . . .

During summer, illnesses come from a combination of several factors. People with seasonal allergies may experience a congested feeling and develop runny noses and itches eyes whenever they get near pollen, mold, or grass. . . . their immune systems might get overworked as they respond to these allergies, which makes them more susceptible to viral contagions.

—Michelle Simmons

"Science explains why we are more vulnerable to getting sick when the seasons change"
Natural News, May 16, 2018

Adeno-associated Virus

A pathogenic virus dependent on the Adenovirus for its existence and its ability to replicate, it lodges inside its host. If possible, set your frequency device to run a sweep from 950–970 for at least 30 minutes. If you are overweight and Adenoviruses are implicated in your condition, also try 6028.99 (from Jeff Sutherland) for 40 minutes at least once a week, for weight control. 950.6, 958.8, 959.6, 960.4, 967.6, 969.3

AIDS

See "HIV (Human Immunodeficiency Virus) / AIDS (Acquired Immune Deficiency Syndrome)" in this section.

Aphthovirus / Foot and Mouth Disease / Hoof and Mouth Disease

This should solely be called "Hoof and Mouth disease" because only animals with cloven hoofs are affected: cows, pigs, sheep, goats, buffalo, yaks, and deer. Symptoms include fever, shivering, smacking the lips, grinding the teeth, drooling, lameness, and permanent reduction of milk. Blister-like lesions can appear on the tongue, lips, snout, muzzle, teats, in the soft tissue between the horny parts of the hooves, and in the mouth and nostrils. This condition is usually not fatal, but young animals die easily due to a high incidence of myocarditis (inflammation of the heart).

This highly contagious disease, which infects animals worldwide, is not easy to treat because at least seven viruses and 60 subsets of viruses are involved and the Latin names of microbes are not easily obtained. Rather than rely on frequencies, use herbs, nutrition, and other natural methods to eliminate infection. See a holistic veterinarian.

Note that this condition is not the same as Hand, Foot and Mouth Disease, which infects children. For Hand, Foot and Mouth Disease, see "Coxsackievirus A16 / Hand, Foot and Mouth Disease" in this section.

From Dr. Garvey and others: 232, 237, 558.38, 585.92, 1171.84, 1214, 1243, 1244, 1271, 5411, 1116.76

Avian Flu / Bird Flu

Influenza A virus is a broad category that infects humans and many animal species. It is divided into subcategories, one of which is the avian or bird flu. Bird flu (classified as subtype H5N1 or AH5N1) originated among wild aquatic birds and is highly contagious. Common to Southeast Asia, it now appears in other regions.

The virus rarely infects humans. Mainstream media exaggerates and outright lies, failing to disclose that this virus is not as widespread as people fear (see page 826 Insert, "The Flu vs. a Pandemic"). While it's true that entire flocks have been destroyed due to an infection, the nature of that infection has been unclear. Note that the infected flocks are all factory farmed, raised in unhealthy overcrowded conditions. There are no reports of this flu affecting pasture raised (free range) birds.

From Dr. Marty Monahan: 4896 to 5060 (sweep)

Bird Flu

See "Avian Flu / Bird Flu," previous entry.

Borna Virus / Borna Disease Virus (BDV)

From the virus family *Bornaviridae*. Borna virus causes horses to stop eating, walk in circles and even kill themselves. It is now known to have a strong link, in humans, to depression and other mental illnesses including bipolar disorder and schizophrenia. BDV also affects cats. There are currently no known frequencies for Borna Virus, so go to dnafrequencies.com. In the meantime, you can try these frequencies.

776, 787, 802 + 1550, 832, 840, 880, 1570, 1998, 2008, 2052, 2127.5, 2489, 2490, 5K

BX Virus

BY Virus

See under **CANCER**.

Cat Virus, unspecified

The frequencies below will probably be insufficient. Make sure to also see **PARASITES, PROTOZOA AND WORMS**, “*Toxoplasma gondii* / Toxoplasmosis.”

364, 379, 645, 654, 333 + 523 + 768 + 786, 840 to 849, 857, 967, 6878

Chikungunya Virus (CHIKV)

Transmitted by mosquitoes to people, birds and rodents. Symptoms can be mistaken for those of dengue fever or the Zika virus. Symptoms include fever, pain and swelling in joints and muscles, headache, rash, fatigue, and sometimes digestive upset and conjunctivitis. Outbreaks have occurred in Africa, Asia and Europe, although in 2014 cases started appearing in the US. People often feel better after about ten days. Doctors believe that immunity occurs after a single infection, but in some people joint and muscle pain persists for months or even years after the initial infection. Treatments include rest, fluids, and anti-inflammatory substances for joint and muscle pain.

From Dr. Richard Loyd: 663, 7293

Cold Sores

See “*Herpes simplex 1*” under **Herpes, all types**, this section.

Coronavirus / SARS / Severe Acute Respiratory Syndrome

Named because of the crown, or bulbous corona, at the top of its structure. There are four to five currently known strains of coronaviruses. Coronaviruses are believed to cause a significant percentage of all colds in humans, mostly in the winter and early spring. However, the most publicized is the strain SARS-CoV, which causes SARS, or Severe Acute Respiratory Syndrome.

SARS affects humans, dogs, cats, pigs, cattle, birds and rodents, commonly infecting the respiratory and gastrointestinal tracts. The epidemic is presumed to have originated in China in November 2002, and then spread to other countries including the United States, Canada, Singapore, and the Philippines. Initial symptoms may include cough, sore throat, pneumonia, muscle pain, diarrhea, and anal warts. Humans have a fever of at least 100.4°F (38°C) and a history of contact with an infected individual. Symptoms generally appear two to 13 days following exposure, although in most cases they occur within two to three days.

Pharmaceutical antibiotics, antivirals, steroids, and other drugs have been found to be ineffective. See Insert on page 828, “Natural Substances That Kill Viruses and/or Support Immune Function.”

145.9, 165.7, 291.7, 331.4, 437.6, 497.1, 583.5, 655, 662.7, 1167, 1312.8, 1325.5, 1491.2, 2333.9, 2651, 4667.8, 5301.9, 9335.6

Covid-19 (SARS-CoV-2)

A laboratory-created, patented virus (related to SARS), whose spike proteins injure the vascular endothelial cells lining the arteries and disrupt molecular signalling to the mitochondria (fuel-burning units of the cells). This explains the wide variety of possible symptoms: heart conditions, including stroke; brain tumors and unrelenting headache; respiratory issues, including wheezing, exacerbation of airborne allergies and difficulty breathing; and neurological disorders, including continual convulsions, shaking, memory loss; and muscle weakness and loss of muscle tone.³³ Try sauna and ozone therapy (see Chapter 3). See Insert on page 828, “Natural Substances That Kill Viruses and/or Support Immune Function.”

There are several reliable sources of frequencies below, each with their own unique system of computing. If one set doesn’t work for you, try another; and if you are still feeling unwell, go to dnafrequencies.com and purchase a set for a very modest sum.

From Dr. Jeff Sutherland. Used with his generous permission. Dr. Sutherland advises eliminating two bacterial cofactors first: *Prevotella* and *Mycobacterium tuberculosis*. See both under **BACTERIA**. This protocol is based on various parts of the Covid anatomy, including spike, nucleocapsid, and membrane proteins. You may need to repeat this for several days to obtain results. This is the order given:

5466.44, 2454.67, 2235.34, 3545.67, 2223, 4545.45, 3344.45, 5454.44, 4656.35, 2235.67, 6666.45, 3455.45, 4545.67, 7546.55, 5676.36, 4545.67, 4545.78, 2232.45, 1112.44, 4454.45, 4676.56, 3454.45, 2454.54, 2234.67, 1334.66

From a clinician who wishes to remain anonymous, but has reported good results. Run for 3 minutes each: 152.2, 155, 304.4, 309.9, 456.5, 464.9, 608.7, 619.9, 760.9, 774.8, 1217.5, 1239.7, 1369.6, 1394.7, 2435, 2479.5, 4870, 4959, 9740, 9918

From Dr. Richard Loyd: 568 and 3,956,175 (one number). The second number is the vibration of Suramin, a safe medication banned by the FDA that addresses the spike proteins. If you received any of the Covid “vaccines” your body is now continually making spike proteins, so you may need to rife this frequency or others for life.

From Jimmie Holman. This scientist, researcher and equipment manufacturer writes: “Over the last two decades, Bioenergetics and Pulsed Technologies (EU) and Pulsed Technologies Research (US) have developed proprietary methods, sources, and biological/laboratory testing to address specific pathogens and their expected mutations. Some methods were developed in close collaboration with PulsedTech associates and professional research partners. The protocols and associated waveforms—optimized to operate on PulsedTech instruments with their broad spectrum capabilities—may not be appropriate for other manufacturers of ‘rife’

The Flu vs. a Pandemic

In under two decades, viruses proclaimed dangerous and deadly were featured on the cover of *Time* magazine: SARS (severe acute respiratory syndrome) in 2003, avian (bird) flu in 2004 and 2005, H1N1 (swine flu) in 2009 (two issues), Ebola in 2014, and Zika in 2016. A pandemic was prophesized in 2017.

Have these viruses really warranted alarm? In 2005 the *British Medical Journal* had editorialized: "The extensive media coverage of avian influenza (bird flu) over recent weeks has caused confusion and increasing concern that bird flu will imminently cause a human pandemic. . . . [However] this AH5N1 avian virus does not currently have the capacity to cause a human pandemic." By 2006, the number of humans with avian flu was 115. In 2007, that number dropped to 86—hardly a compelling statistic, considering prior predictions of a horrible pandemic that could kill 150 million people.³⁴

Jump ahead to 2020 with Covid (also known as Covid-19, or SARS-CoV-2). Billions of people worldwide suffered financial ruin: they lost their jobs, businesses and homes because normal commerce was forbidden to occur. Small, privately owned businesses were forced to close in the name of safety and health, but large chain outlets ("box" stores) were allowed to remain open. "While 45.5 million Americans filed for unemployment," Mercola wrote, "29 new billionaires were created . . . and five of the richest men in the US . . . grew their wealth by a total of \$101.7 billion (26 percent) between March 18 and June 17, 2020, alone. . . . How is it safe to shop with hundreds of people in a Walmart but unsafe to shop in a store that can only hold a fraction of that?"³⁵

Again in the name of health, people were not allowed to congregate in public spaces; and if they did meet, they had to stand six feet apart with masks covering their noses and mouths. This stressful social isolation directly contributed to higher-than-usual divorce rates, domestic violence and child abuse—and even an increase in suicides, especially among teenagers. The cause? The heavily publicized, fear-laden Covid-19 "pandemic" and the worldwide lockdown. Commercial masks were found to contain asbestos and strange toxic fibers. Masks didn't block the transmission of viruses (which are much tinier than the holes in the masks).^{36, 37} Continual covering caused many infections on the mouth and in the respiratory tract^{38, 39}. Also, rebreathing one's own air caused oxygen deprivation leading to scores of health issues, including life-threatening complications.^{40, 41}

Was this really a plague? Coroner reports for the elderly were manipulated so that deaths from cardiovascular disease and other usual conditions

were miraculously almost non-existent; while in their place were suspiciously high numbers of deaths from Covid-19.⁴² "Most people," Dr. Mercola wrote, "have no idea that 94 percent of the death certificates for Covid-19 victims routinely list a number of serious comorbidities leading to death, but that the CDC has ordered doctors to say that in all cases where the deceased has tested positive, or is suspected to be infected, Covid-19 is to be listed as the 'primary' cause of death. . . . The CDC has done its part to ensure that as many deaths as possible are attributed to Covid-19."⁴³ Ironically, the death rate for Covid was similar to that of an ordinary flu, except in vulnerable people over 65 years old who had serious underlying conditions (cardiovascular disease, obesity, respiratory disorders, etc.) that put them at risk for other illnesses.^{44, 45, 46, 47, 48} In fact, people under 60 years old had a lower risk of dying from Covid than they had of dying from a regular, seasonal flu.⁴⁹

Plenty of safe and effective natural (and a few pharmaceutical) protocols were available to treat people who actually did have Covid. However, information on natural treatments was suppressed by the media⁵⁰ and the FDA made access to those drugs difficult.⁵¹ So-called vaccines emerged to treat this condition; but because they were mandated for emergency use, they did not require (nor did they initially receive) FDA approval.^{52, 53}

Covid "vaccines" changed the body's own DNA, causing it to actually create harmful spike proteins that traveled from the injection site to the spleen, liver, bone marrow, adrenals, and ovaries.⁵⁴ People became more, rather than less, susceptible to future infections from all Covid strains. Many suffered from heart attacks, blood clots, strokes, convulsions, seizures, brain tumors, miscarriages, infertility,^{55, 56, 57} anaphylactic reactions, and multisystem inflammatory syndrome.⁵⁸ Vaccine-related data for the US released by the CDC revealed more than 31,240 serious injuries and 6,113 deaths between December 14, 2020 and June 18, 2021.⁵⁹ Just one week later 2,825 more were injured, and 872 more had died.⁶⁰ Statistics for the UK disclosed that from December 9, 2020 to June 23, 2021, people who died numbered 1,403 and over *one million* people—1,007,253—were injured due to "adverse reactions." This was from the so-called cure, not from the virus! More vaccine-related deaths were reported in fewer than five months in 2021 than in the entire previous decade.⁶¹

**No virus has to be a death sentence.
Accepting a dangerous injection is not the answer.
See Insert, page 828.**

machines. The frequencies below [out of a much longer list of over 800 frequencies, covering all strains] are the most important. This program contains all strains detected as of April 27, 2021.” All the times (in parentheses) are in seconds. Coxsackie Viruses (unspecified)

These viruses, along with polioviruses, echoviruses and others, belong to the group enteroviruses. Named for their presumed site of origin, the village of Coxsackie in New York, US, this group has a wide variety of symptoms. From Dr. John Garvey: 136, 232, 422, 424, 435, 921, 923
Also try: 144, 380, 595, 612, 642, 674, 676, 708, 769, 889, 922, 1044, 1083, 1189, 1416, 1422, 1488, 1500, 1850, 2166, 2378, 2632, 2832, 3636, 4125, 4130, 4331, 4357, 4755, 5663, 5921, 5987, 6381, 8255, 8265, 8633, 8719, 9511, 9513

Coxsackie A

Common symptoms are respiratory disturbances, fever, liver disease, skin eruptions, neurological disorders, *Herpes* sores in the throat, and unexpected infant deaths. See below. Also try other entries.

Coxsackievirus A16 / Hand, Foot and Mouth Disease

Caused by Enterovirus family microbes, especially Coxsackievirus A16. Most often afflicts children. Symptoms include fever, sore throat, poor appetite, mouth sores, and a rash or blisters on the palms, soles and buttocks. Virus spreads via feces, mucus, saliva, and fluid from the blisters. Untreated, it will last a week to ten days. The biggest danger is dehydration. Don’t mistake this virus’s symptoms for *Shigella* or *Strep* (both bacteria).

From Dr. Richard Loyd: 889

Coxsackie B

This group may cause throat sores, fever, diarrhea, pneumonia, inflammation of the testicles, central nervous system disability, rash, inflammation of the heart muscle, and brain, liver and adrenal infection.

Coxsackie B 1

834 (from Dr. John Garvey), 353, 384, 587, 723
From Dr. Hulda Clark: 902.27, 18122.49

Lisbon court rules only 0.9% of “verified cases” died of COVID, numbering 152, not [the] 17,000 claimed

Following a citizen’s petition, a Lisbon court was forced to provide verified Covid-19 mortality data . . . According to the ruling, the number of verified Covid-19 deaths from January 2020 to April 2021 is only 152, not about 17,000 as claimed by government ministries.

—www.americasfrontlinedoctors.org, June 23, 2021

Coxsackie B 2

534, 705 (both from Dr. John Garvey), 867

Coxsackie B 3

487, 653, 654, 868

Coxsackie B 4

Often linked to diabetes, especially Type 1.

From Dr. Hulda Clark: 898.55, 18047.81

Coxsackie B 5

From Dr. Garvey: 462, 1043, 1083
Also try: 569, 647, 708, 774

Coxsackie B 6

From Dr. John Garvey: 736, 814
Also try: 343, 488, 551, 657, 668, 669

Cytomegalovirus (CMV) / Salivary Gland Virus

See “*Herpes Virus Type 5 (Human Herpes Type 5) / Cytomegalovirus (CMV) / Salivary Gland Virus*” under *Herpes, all types*, this section.

Dengue Virus, Types 1, 2 and 3 / Dengue Fever / Breakbone Fever

Sudden fever lasts about one week. Symptoms include severe headache, cold clammy skin, weak rapid pulse, and gastrointestinal distress (abdominal pain, diarrhea, nausea and vomiting). Tiny red-purple spots from broken blood vessels appear on lower limbs, chest or entire body. Muscle, joint and head pain can be so severe that Dengue is sometimes called “breakbone fever” or “bone-crusher disease.” Blood platelets, which help with clotting, are usually below normal levels until the fever subsides; so subject may bruise and bleed from mucous membranes and gums. In severe cases, blood vessels may burst in the brain (sensitive to bleeding and damage), leading to death. Children and weak adults are susceptible to dying.

Dengue, transmitted by mosquitoes, has been reported for over 300 years in Asia, Africa and North America. Today it’s most common in Africa, Middle East, Southeast Asia, Brazil, and other tropical locales. Highly infectious in blood or while the subject is still feverish, the virus can be contained by better sanitation and by eliminating open areas of stagnant water where mosquitoes breed.

Natural Substances That Kill Viruses and/or Support Immune Function

- ◆ **Colloidal Silver.** Liquid made through the process of electrolysis. Contains both silver colloids (minute particles) and silver ions (tinier particles, which carry an electrical charge). Disables any single-celled pathogen it touches (see Chapter 3).
- ◆ **Colostrum & Transfer Factors.** Produced by a nursing mammal (or human) just after birth (and before the milk flows). Contains transfer factors that support, strengthen and modulate the body's many immune cells. Both colostrum and transfer factors are sold as supplements.
- ◆ **Echinacea.** Increases the number and mobility of white blood cells, which scavenge pathogens. Taken as a tincture, it must make the mouth tingle or else it's not active. Activates the white blood cells up to three days after you stop taking it.
- ◆ **Elderberry (*sambucus nigra*).** A bush plant. Black elderberry and sometimes blue elderberry have been used for healing for centuries. An antioxidant, elderberry prevents viruses from entering the cell and replicating.
- ◆ **Essential Oils (EOs).** Eucalyptus. Cinnamon bark. Clove bud. Lavender. Lemon. Oregano. Tea Tree. Thyme. Combined, they kill a variety of bacteria, viruses and biofilms. Put in a carrier oil (avocado, jojoba, coconut, sesame, olive), they can be rubbed onto the skin. One or two drops can be poured into an ounce of colloidal silver and inhaled through a medical nebulizer to help the lungs.
- ◆ **Iodine.** Mineral. An essential nutrient and potent natural germicide, used by every tissue of the body. Most people are highly deficient. When taken (under medical supervision) in therapeutic amounts, the iodine floods the body—knocking off toxic bromide and fluoride that had latched on to the iodine cell receptor sites and displaced the iodine. Some people believe they have an iodine allergy, but they are reacting to the toxins that have been released into the bloodstream.
- ◆ **Ozone Therapy.** A gas, safe and effective when used correctly. Kills pathogens while vitalizing healthy tissue. You need special equipment to produce the ozone. An ozone sauna allows the ozone to reach the bloodstream rapidly. Ozone is an oxidant—don't use it at the same time as Vitamin C and other antioxidants (see Chapter 3).
- ◆ **Zinc.** Mineral, vital for immune cell function. A major defense against viruses and other pathogens.
- ◆ **Quercetin / Dihydroquercetin.** A flavonoid found in foods. Repairs blood vessels. Makes Vitamin C last longer by replacing its spent electrons. Most important, it escorts zinc across cell membranes. (It's a safer, natural alternative to the drug hydroxychloroquine, which the FDA has discredited.)
- ◆ **Vitamin D3.** Hormone made by the skin during sun exposure. Also in fatty animal foods. Builds bone and immunity. Deficiency is a primary risk factor in severe Covid-19 infection and death.⁶² Most people are deficient. Test levels every few months to avoid overdosing. Take with magnesium and Vitamin K₂.
- ◆ **Sodium chlorite (also called MMS).** Oxidant, similar to ozone. Sold as an inexpensive supplement. When used as directed, MMS treats any condition involving pathogens (such as Covid) or toxins (such as autism). Don't confuse this with toxic chlorine; the two are very different. See MMS, page 618.
- ◆ **Glutathione & N-acetyl-cysteine (NAC).** Glutathione detoxifies. Keeps white blood cells viable longer. Glutathione deficiency is associated with Covid severity.⁶³ NAC, a precursor to glutathione, counteracts blood clots and reduces replication of influenza viruses.⁶⁴ NAC also modulates inflammation. Available as supplements.
- ◆ **Melatonin.** Hormone produced by pineal gland. Regulates sleep, quells inflammation, enhances Vitamin D signaling, helps build immune cells, recharges glutathione. Take at night. Available as a supplement.
- ◆ **Vitamin C.** Antioxidant. Major defense against all pathogens. Protects cell membranes from invading microbes and also strengthens blood vessels. Take 1 gm every hour or to bowel tolerance.
- ◆ **Star Anise.** Spice. Contains shikimic acid, which prevents spike proteins in Covid and its "vaccines" from attaching to cell receptor sites and spreading. Grind it in a spice grinder and drink it as a tea.
- ◆ **Pine Needle Tea.** Certain safe species (Eastern white, pinyon, Masson pine) are antibacterial, antiviral and antifungal. Prevent platelet clumping. Combats spike proteins (see Star Anise, above).
- ◆ **Fennel Seeds.** Herb. Similar antiviral (and anti-Covid) properties (see Star Anise, above).
- ◆ **Dandelion leaf.** Herb. Similar antiviral properties (see Star Anise, above). Available as a tincture.

Treatment includes increased fluid intake, oral or IV, to prevent dehydration. In severe cases, platelet transfusions are given if platelet count drops too low or if there is significant bleeding. Avoid aspirin, anti-inflammatory drugs, and Vitamin E which can thin the blood and aggravate tendency to bleed. Vitamin K helps the blood clot. One of the best treatments is Vitamin C and bioflavonoids; see the “Ebola virus / Ebola hemorrhagic fever” entry below for more details.

Ebolavirus / Ebola hemorrhagic fever

Ebola is the common term for a group of viruses belonging to the *Filoviridae* family, as well as for the Ebola hemorrhagic fever caused by the virus. The virus is named after the Ebola River Valley in the Democratic Republic of the Congo in central Africa, near the site of the first recorded outbreaks in 1976. The most common symptoms include high fever, abdominal pain, exhaustion, headache, muscle and joint pain, nausea, vomiting, dizziness, and trouble breathing. Less common symptoms include cough, sore throat, skin rash, chest pain, and red eyes. Advanced-stage symptoms, presumably occurring in over 50% of subjects, include bleeding from the nose, mouth, anus, and deeper organs. This disease affects chimpanzees, gorillas, forest antelopes, and monkeys as well as humans. Some believe that the animal carrier is the fruit bat.

Early symptoms of Ebola are sometimes mistaken for malaria, typhoid fever, dysentery, or influenza. The internal bleeding, the inability of the blood to clot, and the blood platelet destruction caused by Ebola is in many ways similar to Dengue Fever. The incubation period used to be reported as ranging from 5 to 10 days. Today, various sources (WHO, or the World Health Organization and the CDC, or Centers for Disease Control) state that the incubation period may last for 42 days, and that on surfaces and objects, the virus can last for 50 days. However, incubation rates can change. Also, the virus may be mutating so much that it is not always readily detected.

Death rates from Ebola have been reported to range from 30% to 50% and even higher, with sufferers characterized as dull and lethargic. Sources differ as to which symptoms are responsible for death. Various blamed are: the effects of vomiting, diarrhea or high fever (rather than bleeding); organ failure; and the decrease in blood plasma volume from the loss of bodily fluids.

In its later stages, Ebola is highly contagious. Prior to 2014, it was transmissible primarily via body fluids, and sometimes via skin and mucous membrane contact. However, it now appears that Ebola is airborne as well. Also, viable viruses have been found on dead bodies even after one week. Moreover, people supposedly cured from Ebola are now being found to have relapses. “Post-Ebola syndrome” has been named for lingering symptoms of vision and hearing loss, joint pain, headaches, and memory

loss. Some Ebola survivors experience abnormal reflexes (including erratic eye movements) and tremors.

At first, outbreaks tended to occur in remote areas. However, after a new, even more virulent, genetically engineered strain of Ebola was awarded a patent in 2010 (see Insert, page 831, “The Politics of Ebola—and Fear”), an Ebola epidemic arose in Africa in the summer of 2014, creating worldwide panic. Before the genetic engineering of the virus, Ebola was dangerous enough: it had already been classified years ago as a “bioterrorism agent” by the CDC, and medical science stated (inaccurately) that there was no treatment for it. Now this new, weaponized strain of Ebola is even more communicable, via liquids that are expelled from an infected individual. This could be saliva spread through the air via coughing, sneezing or speaking; saliva, vomit, urine or diarrhea hitting a surface and dispersing; or even small splashes of water when a toilet containing infectious material is flushed.

Fortunately, successful natural protocols for Ebola exist, although they are not readily publicized by the mainstream media. Most of the health professionals publicizing the natural protocols have chosen to be anonymous. Some therapies are summarized below.

In 1981, Robert Cathcart III, MD, pointed out an intimate connection between Ebola and Vitamin C. Ebola causes the complete depletion of all Vitamin C from the body. Not coincidentally, the very first symptoms of Ebola are consistent with those of scurvy, which is famously known to result from a Vitamin C deficiency. However, whereas scurvy is due to a partial lack of Vitamin C, Ebola is a complete deficiency. Vitamin C, along with bioflavonoids, protects the blood vessels. But without enough Vitamin C, blood vessels weaken and leak blood. Internal and external bleeding is exactly what happens in people stricken by advanced-stage Ebola. Ebola and other hemorrhagic fever diseases also destroy the blood platelets; and without platelets, the blood cannot clot (thus accounting for the leaking). By the time an Ebola sufferer reaches this point, immunity has already been heavily compromised. With all the viral hemorrhagic fevers including Ebola, the individual is likely to hemorrhage quickly: the virus so rapidly and totally consumes all of the Vitamin C in the body, that the condition is essentially an advanced stage of scurvy after only a few days of infection.

Typically, viral hemorrhagic fevers only reach epidemic proportions in populations with low body stores of Vitamin C—such as Africans, who tend to be severely malnourished. Once the Vitamin C stores are gone, the immune cells cannot fight infection. Therefore, it’s critical to get sufficient Vitamin C into the body immediately, even before infection has taken hold. Supplementation should be steady because the kidneys excrete Vitamin C every two hours if the body isn’t using it. Most animals can manufacture their own Vitamin C, but humans (and a few animals) cannot.

Cathcart emphasized that Ebola and the other acute viral hemorrhagic fevers may require 500,000 mg

(500 grams) of Vitamin C daily before diarrhea occurs. (Diarrhea indicates that the body cannot use, at the moment, all the Vitamin C it's receiving. It's called "bowel tolerance.") Even if 500 gm is too high, because of the scurvy-like symptoms of Ebola sufferers, Vitamin C should be administered in unusually high amounts until the symptoms abate. At least 12 grams (not milligrams) a day is the minimal amount to start. Initially, receiving Vitamin C intravenously as well as orally is ideal; but if that's not possible, take Vitamin C orally. Liposomal C, where the vitamin is encased in fat, enters the cells easily and bypasses the problem of bowel tolerance. See Chapter 3, **Nutritional Supplements**, for instructions on how to make your own liposomal Vitamin C. The antioxidant alpha lipoic acid (ALA) helps the body recycle unused Vitamin C.

A South African homeopathic physician successfully used liquid elemental (atomic, nascent) iodine: 20 drops every two hours for 24 hours. Iodine is a potent germicide that the body needs for all its tissues daily, so it's worth keeping handy for all infectious disease conditions.

The frequencies below are experimental only and they might not work. *Do not rely on frequencies alone!* Also, if you are caring for someone who's infected, wear disposable outer clothing and a mask, and scrupulously decontaminate the area with disinfectants.

ECHO Virus / Enteric Cytopathic Human Orphan Virus / Nonpolio Enterovirus Infection

ECHO viruses are a group of enteroviruses whose symptoms include respiratory problems, rashes, nonspecific fevers, gastrointestinal distress, inflammation of the sac around the heart, and a type of meningitis or inflammation of the brain. Also see "Meningitis" and other entries under **BRAIN AND NERVOUS SYSTEM, MIND AND EMOTIONS**.

Enterovirus-71

Attacks the central nervous system, especially in young children. Involved in viral meningitis (polio-like paralysis) and occasionally encephalitis (which can be fatal).

From Dr. John Garvey: 547

Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS) / Herpes Virus 4 (Human Herpes Virus 4)

The Epstein-Barr Virus is actually a strain of *Herpes*. The many *Herpes* strains, although classified as different in their effects and affinities for areas of the body, can gravitate to areas believed to be the domain of other strains. Therefore, read about all of the *Herpes* strains. See "*Herpes* Virus 4 (Human *Herpes* Virus 4) / Epstein-Barr Virus / Infectious Mononucleosis / Chronic Fatigue Syndrome (CFS)" under **VIRUSES, Herpes, all types**.

Feline (Cat) Immunodeficiency Virus (FIV)

Causes an HIV-type illness in domestic cats, affecting up to 3% of cats in the US. FIV attacks and weakens the cat's immune function. Also see **CANCER**, "Leukemia, Feline." 262, 323, 372, 404, 567, 712, 742, 760, 773, 916, 1103, 1132, 3701

Flaviviridae / Yellow Fever Virus / Yellow Fever / Yellow Jack / Black Vomit

The World Health Organization has classified three kinds of Yellow Fever, caused by an arbovirus of the family *Flaviviridae* (one of the smallest RNA viruses isolated so far). Jungle (sylvatic) Yellow Fever affects monkeys, but it can spread to humans who work in tropical rain forests and are bitten by mosquitoes infected by monkeys. Intermediate Yellow Fever occurs simultaneously in many humid or semi-humid savannah villages of Africa, but fewer people die from infection. And urban Yellow Fever, which affects only humans, is spread by mosquitoes that have been infected by other people. Symptoms include high fever, chills, headache, muscle and back aches, vomiting (sometimes bloody), abdominal cramping, and mental confusion. More serious cases involve kidney and heart failure, seizures, and coma. The liver malfunction characteristic of this condition causes jaundice—the yellowing of the skin and whites of the eyes—giving Yellow Fever its name. About 5% of people who contract this illness die, usually within a week of the appearance of symptoms.

This disease can lie dormant and then suddenly become an epidemic. Yellow Fever, common in parts of South America and Africa, has increased since the 1980s. The only treatment medical science suggests is to rest and drink plenty of fluids for a long time—and as a supposed prevention, vaccination. For emergencies and serious illnesses, consult an experienced naturopath or other holistic practitioner. Homeopathy may also help.

H1N1

See "Swine Flu / H1N1" in this viruses section.

Herpes, all types

This is the name of the virus as well as the conditions it causes. Symptoms include sores and inflammation in the genitals and mouth, along the skin, or in the nerves deep inside the body, with itching, burning and pain. There are several different kinds of *Herpes* viruses. *Herpes zoster* causes chicken pox and shingles. Cytomegalovirus causes Cytomegalic Inclusion Disease (CID), mostly affecting very young infants and children. The *Herpes simplex* virus—sometimes called *Herpes virus hominis*, although there's apparently more than one type of *Herpes simplex*—is also known as Human *Herpes* Virus 1. These viruses are

The Politics of Ebola—and Fear

Ebola has always been regarded as a dangerous, though outbreaks tended to occur in remote areas. The spread of the virus was generally contained—or avoided completely—through better sanitation and hygiene, including sterilization of surgical instruments.

The summer of 2014 changed the public's perception of Ebola (if they even knew that it existed) when the media publicized a new epidemic. Ebola began in Sierra Leone, spread to Liberia, and then migrated to other parts of the world largely because infected people traveled on aircraft—unrestricted. By the end of the year, the Centers for Disease Control (CDC) confirmed growing numbers of cases (and deaths) in Guinea, Liberia, Nigeria, Senegal and Sierra Leone, as well as countries outside of Africa, including the US.

This Ebola outbreak was planned. How do we know?

- ◆ An October 18, 2007 news release from Tulane University in New Orleans, Louisiana, US, indicated that the US federal government was funding a study to develop “test kits” for viral hemorrhagic fevers (including Ebola) in West Africa. How did researchers know that a need for such “test” kits would exist? Also, did these kits actually test for disease, or did they do something else?
- ◆ Within weeks of the “epidemic” announcement, the drug company GlaxoSmithKline announced that it had developed an Ebola vaccine. Normally, it takes years of human trials before a new vaccine can be developed, and then another long period before the vaccine is approved. The public is expected to believe that the vaccine was created, and then passed the approval process, in less than a few months—and, moreover, that the vaccine even works!
